Abstract

The Dakota toolkit provides a flexible and extensible interface between simulation codes and iterative analysis methods. Dakota contains algorithms for optimization with gradient and nongradient-based methods; uncertainty quantification with sampling, reliability, and stochastic expansion methods; parameter estimation with nonlinear least squares methods; and sensitivity/variance analysis with design of experiments and parameter study methods. These capabilities may be used on their own or as components within advanced strategies such as surrogate-based optimization, mixed integer nonlinear programming, or optimization under uncertainty. By employing object-oriented design to implement abstractions of the key components required for iterative systems analyses, the Dakota toolkit provides a flexible and extensible problem-solving environment for design and performance analysis of computational models on high performance computers.

This report describes the Dakota class hierarchies. It is derived from annotation of the source code and provides detailed class documentation, including all member functions and attributes.
# Contents

## 1 Dakota Developers Manual

1.1 Introduction ............................................. 13  
1.2 Overview of Dakota .................................... 13  
1.3 Services ................................................. 18  
1.4 Development Practices and Guidance .................. 18  
1.5 Additional Resources ................................... 19  

## 2 Coding Style Guidelines and Conventions

2.1 Introduction ............................................. 21  
2.2 C++/c Style Guidelines ................................. 21  
2.3 File Naming Conventions ............................... 23  
2.4 Class Documentation Conventions ..................... 24  
2.5 CMake Style Guidelines ............................... 24  

## 3 Instructions for Modifying Dakota’s Input Specification

3.1 XML Input Specification ............................... 27  
3.2 Rebuild Generated Files ............................... 30  
3.3 Update Parser Source NIDRProblemDescDB.cpp ....... 30  
3.4 Update Corresponding Data Classes .................. 31  
3.5 Update Database Source ProblemDescDB.cpp ........ 32  
3.6 Use get_<data_type>() Functions ..................... 33  
3.7 Update the Documentation ............................. 33  

## 4 Understanding Iterator Flow

## 5 Interfacing with Dakota as a Library

5.1 Introduction ............................................. 37  
5.2 Basic Dakota library instantiation ..................... 38  
5.3 Configuring Dakota operation ........................... 39  
5.4 Creating a simulator plugin interface ................. 42  
5.5 Retrieving data after a run ............................. 45  
5.6 Linking against the Dakota library .................... 45  

## 6 Performing Function Evaluations

6.1 Synchronous function evaluations ........................ 47  
6.2 Asynchronous function evaluations ...................... 47  
6.3 Analyses within each function evaluation .............. 48
7 Working with Variable Containers and Views
  7.1 Storage in Variables .............................................. 49
  7.2 Storage in SharedVariablesData ................................ 50
  7.3 Active and inactive views ....................................... 51

8 Namespace Index
  8.1 Namespace List .................................................. 53

9 Hierarchical Index
  9.1 Class Hierarchy ................................................ 55

Chapter 1

Dakota Developers Manual

Author

1.1 Introduction

The Dakota software (http://dakota.sandia.gov/) delivers advanced parametric analysis techniques enabling quantification of margins and uncertainty, risk analysis, model calibration, and design exploration with computational models. Dakota contains algorithms for optimization with gradient and non-gradient-based methods, uncertainty quantification with sampling, reliability, stochastic expansion, and interval estimation methods, parameter estimation with nonlinear least squares methods, and sensitivity/variance analysis with design of experiments and parameter study capabilities. (Solution verification and Bayesian approaches are also in development.) These capabilities may be used on their own or as components within advanced algorithms such as surrogate-based optimization, mixed integer nonlinear programming, mixed aleatory-epistemic uncertainty quantification, or optimization under uncertainty. By employing object-oriented design to implement abstractions of the key components required for iterative systems analyses, the Dakota toolkit provides a flexible problem-solving environment for design and performance analysis of computational models on high performance computers.

The Developers Manual focuses on documentation of Dakota design principles and class structures; it derives principally from annotated source code. For information on input command syntax, refer to the Reference Manual[1], and for more details on Dakota features and capabilities, refer to the Users Manual.

1.2 Overview of Dakota

In Dakota, the environment manages execution modes and input/output streams and defines the top-level iterator. This top-level iterator may be either a standard iterator or a meta-iterator. In the former case, the iterator identifies a model and the environment executes the iterator on the model to perform a single study. In the latter case, iterator recursions are present and sub-iterator may identify their own models. In both cases, models may contain additional recursions in the case of nested iteration or surrogate modeling. In a simple example, a hybrid meta-iterator might manage a global optimizer operating on a low-fidelity model that feeds promising design points into a local optimizer operating on a high-fidelity model. And in a more advanced example, a surrogate-based optimization under uncertainty approach would employ an uncertainty quantification iterator nested within an
optimization iterator and would employ truth models contained within surrogate models. Thus, iterators and models provide both stand-alone capabilities as well as building blocks for more sophisticated studies.

A model contains a set of variables, an interface, and a set of responses, and the iterator operates on the model to map the variables into responses using the interface. Each of these components is a flexible abstraction with a variety of specializations for supporting different types of iterative studies. In a Dakota input file, the user specifies these components through environment, method, model, variables, interface, and responses keyword specifications.

The use of class hierarchies provides a mechanism for extensibility in Dakota components. In each of the various class hierarchies, adding a new capability typically involves deriving a new class and providing a set of virtual function redefinitions. These redefinitions define the coding portions specific to the new derived class, with the common portions already defined at the base class. Thus, with a small amount of new code, the existing facilities can be extended, reused, and leveraged for new purposes. The following sections tour Dakota’s class organization.

### 1.2.1 Environment

Class hierarchy: Environment.

Environments provide the top level abstraction for managing different execution modes and managing input and output streams. Specific environments include:

- **ExecutableEnvironment**: the environment for execution of Dakota as a stand-alone application.
- **LibraryEnvironment**: the environment for execution of Dakota as an embedded library service.

### 1.2.2 Iterators

Class hierarchy: Iterator. Iterator implementations may choose to split operations up into run-time phases as described in Understanding Iterator Flow.

The iterator hierarchy contains a variety of iterative algorithms for optimization, uncertainty quantification, nonlinear least squares, design of experiments, and parameter studies. The hierarchy is divided into MetaIterator, Minimizer, and Analyzer branches.

The MetaIterator classes manage sequencing and collaboration among multiple methods with support for concurrent iterator parallelism. Methods include:

- **SeqHybridMetaIterator**: hybrid minimization using a set of iterators employing a corresponding set of models of varying fidelity. The sequential hybrid passes the best solutions from one method in as the starting points of the next method in the sequence.
- **CollabHybridMetaIterator**: hybrid minimization employing collaboration and sharing of response data among methods during the course if iteration. This class is currently a placeholder.
- **EmbedHybridMetaIterator**: hybrid minimization involving periodic use of a local search method for refinement during the iteration of an outer global method. This class is currently a placeholder.
- **ConcurrentMetaIterator**: two similar algorithms are available: (1) multi-start iteration from several different starting points, and (2) pareto set optimization for several different multi-objective weightings. Employs a single iterator with a single model, but runs multiple instances of the iterator concurrently for different settings within the model.

The Minimizer classes address optimization and deterministic calibration and are grouped into:
1.2. OVERVIEW OF DAKOTA

- **Optimization**: Optimizer provides a base class for gradient-based (e.g., CONMINOptimizer and SNLLOptimizer) and derivative-free (e.g., NCSUOptimizer, JEGAOptimizer) optimization solvers. Most of these are wrappers for third-party libraries that implement the optimization algorithms. Classes APPSEvalMgr and COLINApplication provide the function evaluation interface for APPSOptimizer and COLINOptimizer, respectively.

- **Parameter estimation**: LeastSq provides a base class for NL2SOLLeastSq, a least-squares solver based on NL2SOL, SNLLLeastSq, a Gauss-Newton least-squares solver, and NLSSOLLeastSq, an SQP-based least-squares solver.

- **Surrogate-based minimization (both optimization and nonlinear least squares)**: SurrBasedMinimizer provides a base class for SurrBasedLocalMinimizer, SurrBasedGlobalMinimizer, and EffGlobalMinimizer. The surrogate-based local and global methods employ a single iterator with any of the available Surrogate-Model capabilities (local, multipoint, or global data fits or hierarchical approximations) and perform a sequence of approximate optimizations, each involving build, optimize, and verify steps. The efficient global method, on the other hand, hard-wires a recursion involving Gaussian process surrogate models coupled with the DIRECT global optimizer to maximize an expected improvement function.

The Analyzer classes are grouped into:

- **Uncertainty quantification**: NonD provides a base class for non-deterministic methods in several categories:

  - Sampling: NonDSampling is further specialized with the NonDLHSSampling class for Latin hypercube and Monte Carlo sampling, and a number of other classes supporting incremental and adaptive sampling such as NonDAdaptImpSampling for multi-modal adaptive importance sampling.

  - Reliability Analysis: NonDReliability is further specialized with local and global methods (NonDLocalReliability and NonDGlobalReliability). NonDPOFDarts implements a computational geometry-based reliability method.

  - Stochastic Expansions: NonDExpansion includes specializations for generalized polynomial chaos (NonDPolynomialChaos) and stochastic collocation (NonDStochCollocation) and is supported by the NonDIntegration helper class, which supplies cubature, tensor-product quadrature and Smolyak sparse grid methods (NonDCubature, NonDQuadrature, and NonDSparseGrid).

  - Bayesian Calibration: NonDCalibration provides a base class for nondeterministic calibration methods with specialization to Bayesian calibration in NonDBayesCalibration, and specific implementations such as NonDQUESTBayesCalibration.

  - NonDInterval provides a base class for epistemic interval-based UQ methods. Three interval analysis approaches are provided: LHS (NonDLHSGlobalInterval), efficient global optimization (NonDGlobInterval), and local optimization (NonDLocalInterval). Each of these three has specializations for single interval and Dempster-Shafer Theory of Evidence approaches.

- **Parameter studies and design of experiments**: PStudyDACE provides a base class for ParamStudy, which provides capabilities for directed parameter space interrogation, PSUADESDesignCompExp, which provides access to the Morris One-At-a-Time (MOAT) method for parameter screening, and DDACEDesignCompExp and FSUDESDesignCompExp, which provide for parameter space exploration through design and analysis of computer experiments. NonDLHSSampling from the uncertainty quantification branch also supports design of experiments when in active all variables mode.

- **Solution verification studies**: Verification provides a base class for RichExtrapVerification (verification via Richardson extrapolation) and other solution verification methods in development.
1.2.3 Models

Class hierarchy: Model.

The model classes are responsible for mapping variables into responses when an iterator makes a function evaluation request. There are several types of models, some supporting sub-iterators and sub-models for enabling layered and nested relationships. When sub-models are used, they may be of arbitrary type so that a variety of recursions are supported.

- **SimulationModel**: variables are mapped into responses using a simulation-based Interface object. No sub-iterators or sub-models are used.

- **SurrogateModel**: variables are mapped into responses using an approximation. The approximation is built and/or corrected using data from a sub-model (the truth model) and the data may be obtained using a sub-iterator (a design of experiments iterator). SurrogateModel has two derived classes: DataFitSurrModel for data fit surrogates and HierarchSurrModel for hierarchical models of varying fidelity. The relationship of the sub-iterators and sub-models is considered to be "layered" since they are not used as part of every response evaluation on the top level model, but rather used periodically in surrogate update and verification steps.

- **NestedModel**: variables are mapped into responses using a combination of an optional Interface and a sub-iterator/sub-model pair. The relationship of the sub-iterators and sub-models is considered to be "nested" since they are used to perform a complete iterative study as part of every response evaluation on the top level model.

- **RecastModel**: recasts the inputs and outputs of a sub-model for the purposes of variable transformations (e.g., variable scaling, transformations to standardized random variables) and problem reformulation (e.g., multi-objective optimization, response scaling, augmented Lagrangian merit functions, expected improvement).

1.2.4 Variables

Class hierarchy: Variables.

The Variables class hierarchy manages design, aleatory uncertain, epistemic uncertain, and state variable types for continuous, discrete integer, and discrete real domain types. This hierarchy is specialized according to how the domain types are managed:

- **MixedVariables**: domain type distinctions are retained, such that separate continuous, discrete integer, and discrete real domain types are managed. This is the default Variable perspective, and draws its name from "mixed continuous-discrete" optimization.

- **RelaxedVariables**: domain types are combined through relaxation of discrete constraints; i.e., continuous and discrete variables are merged into continuous arrays through relaxation of integrality (for discrete integer ranges) or set membership (for discrete integer or discrete real sets) requirements. The branch and bound minimizer is the only method using this approach at present.

Whereas domain types are defined based on the derived Variables class selection, the selection of active variable types is handled within each of these derived classes using variable views. These permit different algorithms to work on different subsets of variables. Data shared among Variables instances is stored in SharedVariablesData. For details on managing variables, see Working with Variable Containers and Views.

The Constraints hierarchy manages bound, linear, and nonlinear constraints and utilizes the same specializations for managing bounds on the variables (see MixedVarConstraints and RelaxedVarConstraints).
1.2. OVERVIEW OF DAKOTA

1.2.5 Interfaces

Class hierarchy: Interface.

Interfaces provide access to simulation codes or, conversely, approximations based on simulation code data. In the simulation case, an ApplicationInterface is used. ApplicationInterface is specialized according to the simulation invocation mechanism, for which the following nonintrusive approaches are supported:

- SysCallApplicInterface: the simulation is invoked using a system call (the C function system()). Asynchronous invocation utilizes a background system call. Utilizes the CommandShell utility.

- ForkApplicInterface: the simulation is invoked using a fork (the fork/exec/wait family of functions). Asynchronous invocation utilizes a nonblocking fork.

- SpawnApplicInterface: for Windows, fork is replaced by spawn. Asynchronous invocation utilizes a nonblocking spawn.

Fork and Spawn are inherited from ProcessHandleApplicInterface and System and ProcessHandle are inherited from ProcessApplicInterface. A semi-intrusive approach is also supported by:

- DirectApplicInterface: the simulation is linked into the Dakota executable and is invoked using a procedure call. Asynchronous invocations will utilize nonblocking threads (capability not yet available). Specializations of the direct interface are implemented in MatlabInterface, PythonInterface, ScilabInterface, and (for built-in testers) TestDriverInterface, while examples of plugin interfaces for library mode in serial and parallel, respectively, are included in SerialDirectApplicInterface and ParallelDirectApplicInterface

Scheduling of jobs for asynchronous local, message passing, and hybrid parallelism approaches is performed in the ApplicationInterface class, with job initiation and job capture specifics implemented in the derived classes.

In the approximation case, global, multipoint, or local data fit approximations to simulation code response data can be built and used as surrogates for the actual, expensive simulation. The interface class providing this capability is

- ApproximationInterface: builds an approximation using data from a truth model and then employs the approximation for mapping variables to responses. This class contains an array of Approximation objects, one per response function, which support a variety of approximation types using the different Approximation derived classes. These include SurfpackApproximation (provides kriging, MARS, moving least squares, neural network, polynomial regression, and radial basis functions), GaussProcApproximation (Gaussian process models), PecosApproximation (multivariate orthogonal and Lagrange interpolation polynomials from Pecos), TANA3Approximation (two-point adaptive nonlinearity approximation), and TaylorApproximation (local Taylor series).

which is an essential component within the DataFitSurrModel capability described above in Models.

1.2.6 Responses

Class: Response.

The Response class provides an abstract data representation of response functions and their first and second derivatives (gradient vectors and Hessian matrices). These response functions can be interpreted as objective functions and constraints (optimization data set), residual functions and constraints (least squares data set), or generic response functions (uncertainty quantification data set). This class is not currently part of a class hierarchy, since the abstraction has been sufficiently general and has not required specialization.
1.3 Services

A variety of services and utilities are used in Dakota for parallel computing, failure capturing, restart, graphics, etc. An overview of the classes and member functions involved in performing these services is included here.

- Multilevel parallel computing: Dakota supports multiple levels of nested parallelism. A meta-iterator can manage concurrent iterators, each of which manages concurrent function evaluations, each of which manages concurrent analyses executing on multiple processors. Partitioning of these levels with MPI communicators is managed in ParallelLibrary and scheduling routines for the levels are part of IteratorScheduler, ApplicationInterface, and ForkApplicInterface.

- Option management: Global options controlling behavior are managed in ProgramOptions, with the help of command-line option parsing in CommandLineHandler.

- Parsing: Dakota employs NIDR (New Input Deck Reader) via Dakota::ProblemDescDB::parse_inputs to parse user input files. NIDR uses the keyword handlers in the NIDRProblemDescDB derived class to populate data within the ProblemDescDB base class, which maintains a DataEnvironment specification and lists of DataMethod, DataModel, DataVariables, DataInterface, and DataResponses specifications. Procedures for modifying the parsing subsystem are described in Instructions for Modifying Dakota’s Input Specification.

- Failure capturing: Simulation failures can be trapped and managed using exception handling in ApplicationInterface and its derived classes.

- Restart: Dakota maintains a record of all function evaluations both in memory (for capturing any duplication) and on the file system (for restarting runs). Restart options are managed through ProgramOptions (with the help of CommandLineHandler); file management in OutputManager; and restart file insertions occur in ApplicationInterface. The dakota_restart_util executable, built from restart_util.cpp, provides a variety of services for interrogating, converting, repairing, concatenating, and post-processing restart files.

- Memory management: Dakota employs the techniques of reference counting and representation sharing through the use of letter-envelope and handle-body idioms (Coplien, ”Advanced C++”). The former idiom provides for memory efficiency and enhanced polymorphism in the following class hierarchies: Environment, Iterator, Model, Variables, Constraints, Interface, ProblemDescDB, and Approximation. The latter idiom provides for memory efficiency in data-intensive classes which do not involve a class hierarchy. The Response and parser data (DataEnvironment, DataMethod, DataModel, DataVariables, DataInterface, and DataResponses) classes use this idiom. When managing reference-counted data containers (e.g., Variables or Response objects), it is important to properly manage shallow and deep copies, to allow for both efficiency and data independence as needed in a particular context.

- Graphics and Output: Dakota provides 2D iteration history graphics using Motif widgets. Graphics data can also be cataloged in a tabular data file for post-processing with 3rd party tools such as Matlab, Tecplot, etc. These capabilities are encapsulated within the Graphics class. An experimental results database is implemented in ResultsManager and ResultsDBAny. Options for controlling output and facilities for managing it are in OutputManager.

1.4 Development Practices and Guidance

The following links provide guidance for core software components or specific development activities:

- Coding Style Guidelines and Conventions - coding practices used by the Dakota development team.
1.5. ADDITIONAL RESOURCES

- **Instructions for Modifying Dakota’s Input Specification** - how to interact with NIDR and the associated Dakota classes.

- **Interfacing with Dakota as a Library** - embed Dakota as a service within your application.

- **Understanding Iterator Flow** - explanation of the full granularity of steps in Iterator execution.

- **Performing Function Evaluations** - an overview of the classes and member functions involved in performing function evaluations synchronously or asynchronously.

- **Working with Variable Containers and Views** - discussion of data storage for variables and explanation of active and inactive views of this data.

1.5 Additional Resources

Additional development resources include:

- The Dakota Developer Portal linked from [http://dakota.sandia.gov/content/developer-portal/](http://dakota.sandia.gov/content/developer-portal/) includes information on getting started as a developer and links to project management resources.

- Project web pages are maintained at [http://dakota.sandia.gov/](http://dakota.sandia.gov/) including links to frequently asked questions, documentation, publications, mailing lists, and other resources.

- A Quickstart for bringing a new Third-Party Library (TPL) into Dakota can be found in the Dakota source tree under `$DAKOTA_SRC/packages/external/demo_tpl/README.md`.
Chapter 2

Coding Style Guidelines and Conventions

2.1 Introduction

Common code development practices can be extremely useful in multiple developer environments. Particular styles for code components lead to improved readability of the code and can provide important visual cues to other developers. Much of this recommended practices document is borrowed from the CUBIT mesh generation project, which in turn borrows its recommended practices from other projects, yielding some consistency across Sandia projects. While not strict requirements, these guidelines suggest a best-practices starting point for coding in Dakota.

2.2 C++/c Style Guidelines

Style guidelines involve the ability to discern at a glance the type and scope of a variable or function.

2.2.1 Class and variable styles

Class names should be composed of two or more descriptive words, with the first character of each word capitalized, e.g.:

```cpp
class ClassName;
```

Class member variables should be composed of two or more descriptive words, with the first character of the second and succeeding words capitalized, e.g.:

```cpp
double classMemberVariable;
```

Temporary (i.e. local) variables are lower case, with underscores separating words in a multiple word temporary variable, e.g.:

```cpp
int temporary_variable;
```

Constants (i.e. parameters) and enumeration values are upper case, with underscores separating words, e.g.:

```cpp
const double CONSTANT_VALUE;
```
2.2.2 Function styles

Function names are lower case, with underscores separating words, e.g.:

```c
int function_name();
```

There is no need to distinguish between member and non-member functions by style, as this distinction is usually clear by context. This style convention allows member function names which set and return the value of a similarly-named private member variable, e.g.:

```c
int memberVariable;
void member_variable(int a) { // set
    memberVariable = a;
}
int member_variable() const { // get
    return memberVariable;
}
```

In cases where the data to be set or returned is more than a few bytes, it is highly desirable to employ const references to avoid unnecessary copying, e.g.:

```c
void continuous_variables(const RealVector& c_vars) { // set
    continuousVariables = c_vars;
} const RealVector& continuous_variables() const { // get
    return continuousVariables;
}
```

Note that it is not necessary to always accept the returned data as a const reference. If it is desired to be able change this data, then accepting the result as a new variable will generate a copy, e.g.:

```c
const RealVector& c_vars = model.continuous_variables();
RealVector c_vars = model.continuous_variables();
```

2.2.3 Miscellaneous

Appearance of typedefs to redefine or alias basic types is isolated to a few header files (data_types.h, template_defns.h), so that issues like program precision can be changed by changing a few lines of typedefs rather than many lines of code, e.g.:

```c
typedef double Real;
```

xemacs is the preferred source code editor, as it has C++ modes for enhancing readability through color (turn on "Syntax highlighting"). Other helpful features include "Paren highlighting" for matching parentheses and the "New Frame" utility to have more than one window operating on the same set of files (note that this is still the same edit session, so all windows are synchronized with each other). Window width should be set to 80 internal columns, which can be accomplished by manual resizing, or preferably, using the following alias in your shell resource file (e.g., .cshrc):

```c
alias xemacs "xemacs -g 81x63"
```

where an external width of 81 gives 80 columns internal to the window and the desired height of the window will vary depending on monitor size. This window width imposes a coding standard since you should avoid line wrapping by continuing anything over 80 columns onto the next line.

Indenting increments are 2 spaces per indent and comments are aligned with the code they describe, e.g.
2.3. FILE NAMING CONVENTIONS

void abort_handler(int code)
{
  int initialized = 0;
  MPI_Initialized(&initialized);
  if (initialized) {
    // comment aligned to block it describes
    int size;
    MPI_Comm_size(MPI_COMM_WORLD, &size);
    if (size>1)
      MPI_Abort(MPI_COMM_WORLD, code);
    else
      exit(code);
  }
  else
    exit(code);
}

Also, the continuation of a long command is indented 2 spaces, e.g.:

const String& iterator_scheduling
  = problem_db.get_string("strategy.iterator.scheduling");

and similar lines are aligned for readability, e.g.:

cout << "Numerical gradients using " << finiteDiffStepSize*100. << "%"
  << finiteDiffType << " differences to be calculated by the "
  << methodSource << " finite difference routine." << endl;

Lastly, #ifdef’s are not indented (to make use of syntax highlighting in xemacs).

2.3 File Naming Conventions

In addition to the style outlined above, the following file naming conventions have been established for the Dakota project.

File names for C++ classes should, in general, use the same name as the class defined by the file. Exceptions include:

- with the introduction of the Dakota namespace, base classes which previously utilized prepended Dakota identifiers can now safely omit the identifiers. However, since file names do not have namespace protection from name collisions, they retain the prepended Dakota identifier. For example, a class previously named DakotaModel which resided in DakotaModel.cpp/hpp, is now Dakota::Model (class Model in namespace Dakota) residing in the same filenames. The retention of the previous filenames reduces the possibility of multiple instances of a Model.hpp causing problems. Derived classes (e.g., NestedModel) do not require a prepended Dakota identifier for either the class or file names.

- in a few cases, it is convenient to maintain several closely related classes in a single file, in which case the file name may reflect the top level class or some generalization of the set of classes (e.g., DakotaResponse.[CH] files contain Dakota::Response and Dakota::ResponseRep classes, and DakotaBinStream.[CH] files contain the Dakota::BiStream and Dakota::BoStream classes).

The type of file is determined by one of the four file name extensions listed below:

- .hpp A class header file ends in the suffix .hpp. The header file provides the class declaration. This file does not contain code for implementing the methods, except for the case of inline functions. Inline functions are to be placed at the bottom of the file with the keyword inline preceding the function name.

- .cpp A class implementation file ends in the suffix .cpp. An implementation file contains the definitions of the members of the class.
• .h A header file ends in the suffix .h. The header file contains information usually associated with procedures. Defined constants, data structures and function prototypes are typical elements of this file.

• .c A procedure file ends in the suffix .c. The procedure file contains the actual procedures.

2.4 Class Documentation Conventions

Class documentation uses the doxygen tool available from http://www.doxygen.org and employs the JAVA-doc comment style. Brief comments appear in header files next to the attribute or function declaration. Detailed descriptions for functions should appear alongside their implementations (i.e., in the .cpp files for non-inlined, or in the headers next to the function definition for inlined). Detailed comments for a class or a class attribute must go in the header file as this is the only option.

NOTE: Previous class documentation utilities (class2frame and class2html) used the “//” comment style and comment blocks such as this:

```c
// Class: Model
// Description: The model to be iterated by the Iterator.
// Contains Variables, Interface, and Response objects.
// Owner: Mike Eldred
```

These tools are no longer used, so remaining comment blocks of this type are informational only and will not appear in the documentation generated by doxygen.

2.5 CMake Style Guidelines

Dakota conventions for CMake files, such as CMakeLists.txt, FooConfig.cmake, etc., follow. Our goal is ease of reading, maintenance, and support, similar to the C++ code itself. Current CMake versions and build hints are maintained at the Developer Portal http://dakota.sandia.gov/developer/.

2.5.1 CMake Code Formatting

• Indentation is 2 spaces, consistent with Dakota C++ style.

• Lines should be kept to less than 80 chars per line where possible.

• Wrapped lines may be indented two spaces or aligned with prior lines.

• For ease of viewing and correctness checking in Emacs, a customization file is available: http://www.-cmake.org/CMakeDocs/cmake-mode.el

2.5.2 CMake Variable Naming Conventions

These variable naming conventions are especially important for those that ultimately become preprocessor defines and affect compilation of source files.

• Classic/core elements of the CMake language are set in lower_case, e.g., option, set, if, find_library.

• Static arguments to CMake functions and macros are set in UPPER_CASE, e.g. REQUIRED, NO_MODULE, QUIET.

• Minimize "global" variables, i.e., don’t use 2 variables with the same meaning when one will do the job.
2.5. **CMAKE STYLE GUIDELINES**

- Feature toggling: when possible, use the "HAVE_<pkg/feature>" convention already in use by many CMake-enabled TPLs, e.g.,

```
$ grep HAVE_SYSTEM Dakota/src/CMakeLists.txt
check_function_exists(system HAVE_SYSTEM)
  if (HAVE_SYSTEM)
    add_definitions("-DHAVE_SYSTEM")
  endif(HAVE_SYSTEM)
```

```
$ grep HAVE_CONMIN Dakota/src/CMakeLists.txt Dakota/packages/CMakeLists.txt
Dakota/src/CMakeLists.txt:if(HAVE_CONMIN)
Dakota/src/CMakeLists.txt:endif(HAVE_CONMIN)
Dakota/packages/CMakeLists.txt:option(HAVE_CONMIN "Build the CONMIN package." ON)
Dakota/packages/CMakeLists.txt:if(HAVE_CONMIN)
Dakota/packages/CMakeLists.txt:endif(HAVE_CONMIN)
```

- When a variable/preprocessor macro could result in name clashes beyond Dakota scope, e.g., for library-mode users, consider prefixing the "HAVE_<pkg>" name with DAKOTA_, e.g. DAKOTAHAVE_MPI. Currently, MPI is the only use case for such a variable in Dakota, but many examples can be found in the CMake Modules source, e.g.

```
grep _HAVE_<cmake_prefix_dir>/share/cmake-2.8/Modules/*
```
Chapter 3

Instructions for Modifying Dakota’s Input Specification

To modify Dakota’s input specification (for maintenance or addition of new input syntax), specification maintenance mode must be enabled at Dakota configure time with the \texttt{-DENABLE\_SPEC\_MAINT} option, e.g.,

\texttt{./cmake -DENABLE\_SPEC\_MAINT:BOOL=ON ..}

This will enable regeneration of NIDR and Dakota components which must be updated following a spec change.

3.1 XML Input Specification

The authoritative source for valid Dakota input grammar is \texttt{dakota/src/dakota.xml}. The schema defining valid content for this XML file is in \texttt{dakota/src/dakota.xsd}. NIDR remains Dakota’s user input file parser, so \texttt{dakota.xml} is translated to \texttt{dakota/src/dakota.input.nspec} during the Dakota build process. To update the XML input definition:

- Make sure \texttt{ENABLE\_SPEC\_MAINT} is enabled in your build and necessary Java development tools are installed (see below).
- Edit the XML spec in \texttt{dakota.xml}.
- Perform a make in \texttt{dakota.build/src} which will regenerate \texttt{dakota.source/src/dakota.input.nspec} and related file.
- Review that any changes induced in the \texttt{dakota.input.nspec} file are as expected.
- Proceed with verifying code changes and making downstream parse handler changes as normal (described below).
- Commit the modified \texttt{dakota.xml,dakota.input.nspec, and other files generated to dakota-source/src} along with your other code changes.

3.1.1 XML Build Requirements

Editing the XML and then compiling Dakota requires
- Java Development Kit (JDK) providing the Java compiler javac. Java 6 (version 1.6) or newer should work, with Java 8 recommended. Can satisfy on RHEL6 with RPM packages java-1.8.0-openjdk-devel and java-1.8.0-openjdk. This is needed to build the Java-based XML to NIDR translator. If this becomes too burdensome, we can check in the generated xml2nidr.jar file.

### 3.1.2 XML Editing Tools

The following tools will make editing dakota.input.xml easier.

- **Recommended: Eclipse Web Tools Platform.** Includes both graphical and text editors.
  1. Download Eclipse Standard (Classic)
  2. Configure proxy if needed, setting to manual: Window > Preferences > General > Network CONNECTION > Proxy
  3. Install Web Tools Platform
     - Help > Install New Software
     - Search "Eclipse X" and install two packages under Web, XML, Java
       * Eclipse XML Editors and Tools
       * Eclipse XSL Developer Tools
     - Optionally install C/C++ Development Tools
  4. Optional: add Subclipse for subversion (Subversive is the other major competing tool and I don’t think requires JavaHL) Help > Install New Software Work With: http://subclipse.tigris.org/update_1.6.x Install Subclipse On Linux: yum install subversion-javahl.x86_64
  5. Alternately install Eclipse for Java or Eclipse Java EE development which includes webtools, then optionally add subclipse and C/C++ dev

- **Alternate: Emacs or your usual editor.** For example, Emacs supports an Nxml mode. You can tell it where to find the schema, edit XML, and have it perform validation against the schema. See help at http://www.gnu.org/software/emacs/manual/html_mono/nxml-mode.html

- **Other Suggested Alternates:** XMLSpy, DreamWeaver, XML Copy Editor

### 3.1.3 XML Features (with map to NIDR)

Out of necessity, Dakota XML dakota.xml closely mirrors dakota.input.nspec. Valid Dakota input grammar is constrained by dakota.xml, an XML document which must validate against dakota.xsd. The top-level element of interest is `<input>`, which is comprised of a sequence of content elements (keywords, alternates, etc.), which may themselves contain additional child content elements. The key content types are:

- **Keyword** (`<keyword>`): specified with the `<keyword>` element whose definition is given by keyword-Type in dakota.xsd. The required attributes are:

  - **name:** The keyword name (lower case with underscores) as it will be given in user input; must follow same uniqueness rules are historical NIDR. User input is allowed in mixed case, but the XML must use lower case names.

  Since the NIDR parser allows keyword abbreviation, you **must** not add a keyword that could be misinterpreted as an abbreviation for a different keyword within the same top-level keyword, such as
“environment” and ”method”. For example, adding the keyword ”expansion” within the method specification would be a mistake if the keyword ”expansion_factor” already was being used in this block. The NIDR input is somewhat order-dependent, allowing the same keyword to be reused multiple times in the specification. This often happens with aliases, such as lower_bounds, upper_bounds and initial_point. Ambiguities are resolved by attaching a keyword to the most recently seen context in which it could appear, if such exists, or to the first relevant context that subsequently comes along in the input file.

- **code**: The verbatim NIDR handler to be invoked when this keyword parsed. In NIDR this was specified with \{N_macro(...)}.

Optional/useful parser-related elements/attributes in order of importance are:

- **param sub-element**: Parameters and data types: A keyword may have an associated parameter element with a specified data type: `<param type="PARAMTYPE" />`. NIDR data types remain the same (INTEGER, REAL, STRING and LISTS thereof, but new data types INPUT_FILE and OUTPUT_FILE add convenience for the GUI, mapping to STRING for NIDR purposes. Parameters can also include attributes constraint, in_taglist, or taglist, which are used to help validate the user-specified parameter value. For example constraint >= 0 LEN normal uncertain

- **alias sub-element**: Historical aliases for this keyword (can appear multiple times). Alias has a single attribute name which must be lower case with underscores.

- **id**: Unique ID for the keyword, usually name with an integer appended, but not currently used/enforced.

- **minOccurs**: Minimum occurrences of the keyword in current context (set to 1 for required, 0 for optional)

- **maxOccurs**: Maximum occurrences of the keyword in current context (for example environment may appear at most once)

And optional/useful GUI-related attributes are:

- **help**: (Don’t add this attribute the new keywords!) A pointer to the corresponding reference manual section (deprecated as not needed with new reference manual format which mirrors keyword hierarchy).

- **label**: A short, friendly label string for the keyword in the GUI. Format these like titles, e.g., ”Initial Point for Search”.

- **group**: Category or group for this keyword, e.g., optimization vs. parameter study if they are to be groups for GUI purposes

- **Alternation** (<oneOf>): Alternation of groups of content is done with the element `<oneOf>` which indicates that its immediate children are alternates. In NIDR this was done with the pipe symbol: OptionA | OptionB. oneOf allows the label attribute and its use is recommended.

- **Required Group** (<required>): A required group can be specified by enclosing the contents in the `<required>` element. In NIDR this was done by enclosing the content in parentheses: ( required group... )

- **Optional Group** (<optional>): An optional group can be specified by enclosing the contents in the `<optional>` element. In NIDR this was done by enclosing the content in brackets: [ optional group... ]
3.2 Rebuild Generated Files

When configured with `-DENABLE_SPEC_MAINT`, performing a make in `dakota.build/src` will regenerate all files which derive from `dakota.xml`, including `dakota.input.nspec`, `NIDR_keywds.hpp`, and `dakota.input.-summary`. If you commit changes to a source repository, be sure to commit any automatically generated files in addition to any modified in the following steps. It is not strictly necessary to run make at this point in the sequence, and in fact may generate errors if necessary handlers aren’t yet available.

Warning

Please do not manually modify generated files!

3.3 Update Parser Source NIDRProblemDescDB.cpp

Many keywords have data associated with them: an integer, a floating-point number, a string, or arrays of such entities. Data requirements are specified in `dakota.input.nspec` by the tokens INTEGER, REAL, STRING, INTEGERLIST, REALLIST, STRINGLIST. (Some keywords have no associated data and hence no such token.) After each keyword and data token, the `dakota.input.nspec` file specifies functions that the NIDR parser should call to record the appearance of the keyword and deal with any associated data. The general form of this specification is

```
{ startfcn, startdata, stopfcn, stopdata }
```

i.e., a brace-enclosed list of one to four functions and data pointers, with trailing entities taken to be zero if not present; zero for a function means no function will be called. The `startfcn` must deal with any associated data. Otherwise, the distinction between `startfcn` and `stopfcn` is relevant only to keywords that begin a group of keywords (enclosed in parentheses or square brackets). The `startfcn` is called before other entities in the group are processed, and the stop function is called after they are processed. Top-level keywords often have both `startfcn` and `stopfcn`; `stopfcn` is uncommon but possible for lower-level keywords. The `startdata` and (if needed) `stopdata` values are usually pointers to little structures that provide keyword-specific details to generic functions for `startfcn` and `stopfcn`. Some keywords that begin groups (such as "approx_problem" within the top-level "environment" keyword) have no need of either a `startfcn` or a `stopfcn`; this is indicated by "{0}".

Most of the things within braces in `dakota.input.nspec` are invocations of macros defined in `dakota.-source/src/NIDRProblemDescDB.cpp`. The macros simplify writing `dakota.input.nspec` and make it more readable. Most macro invocations refer to little structures defined in `NIDRProblemDescDB.cpp`, usually with the help of other macros, some of which have different definitions in different parts of `NIDRProblemDescDB.cpp`. When adding a keyword to `dakota.input.nspec`, you may need to add a structure definition or even introduce a new data type. `NIDRProblemDescDB.cpp` has sections corresponding to each top-level keyword. The top-level keywords are in alphabetical order, and most entities in the section for a top-level keyword are also in alphabetical order. While not required, it is probably good practice to maintain this structure, as it makes things easier to find.

Any integer, real, or string data associated with a keyword are provided to the keyword’s `startfcn`, whose second argument is a pointer to a `Values` structure, defined in header file `nidr.h`.

**Example 1:** if you added the specification:

```
[method_setting REAL {method_setting_start, &method_setting_details}]
```

you would provide a function

```cpp
void NIDRProblemDescDB::
method_setting_start(const char *keyname, Values *val, void **g, void *v)
{ ... }
```

in `NIDRProblemDescDB.cpp`. In this example, argument `&method_setting_details` would be passed as `v.val->n` (the number of values) would be 1 and `*v->r` would be the REAL value given for the `method-setting` keyword. The `method_setting_start` function would suitably store this value with the help of `method_setting_details`. 
3.4. Update Corresponding Data Classes

For some top-level keywords, \( g \) (the third argument to the startfcn and stopfcn) provides access to a relevant context. For example, `method_start` (the startfcn for the top-level `method` keyword) executes

```cpp
DataMethod *dm = new DataMethod;
g = (void*)dm;
```

(and supplies a couple of default values to `dm`). The start functions for lower-level keywords within the `method` keyword get access to `dm` through their `g` arguments. Here is an example:

```cpp
void NIDRProblemDescDB::method_str(const char *keyname, Values *val, void **g, void *v)
{
    (**(DataMethod**)g)->**(String DataMethod::**)v = *val->s;
}
```

In this example, `v` points to a pointer-to-member, and an assignment is made to one of the components of the `DataMethod` object pointed to by `*g`. The corresponding stopfcn for the top-level `method` keyword is

```cpp
void NIDRProblemDescDB::method_stop(const char *keyname, Values *val, void **g, void *v)
{
    DataMethod *p = *(DataMethod**)g;
pDDBInstance->dataMethodList.insert(*p);
delete p;
}
```

which copies the now populated `DataMethod` object to the right place and cleans up.

**Example 2:** if you added the specification

```plaintext
[method_setting REALLIST {{N_mdm(RealL,methodCoeffs)}]
```

then `method_RealL` (defined in NIDRProblemDescDB.cpp) would be called as the startfcn, and `methodCoeffs` would be the name of a (currently nonexistent) component of `DataMethod`. The `N_mdm` macro is defined in NI- DRProblemDescDB.cpp; among other things, it turns `RealL` into `NIDRProblemDescDB::method_RealL`. This function is used to process lists of REAL values for several keywords. By looking at the source, you can see that the list values are `val->r[i]` for `0 <= i < val->n`.

### 3.4 Update Corresponding Data Classes

The Data classes (`DataEnvironment`, `DataMethod`, `DataModel`, `DataVariables`, `DataInterface`, and `DataResponses`) store the parsed user input data. In this step, we extend the Data class definitions to include any new attributes referred to in `dakota.xml` or `NIDRProblemDescDB`.

#### 3.4.1 Update the Data Class Header File

Add a new attribute to the public data for each of the new specifications. Follow the style guide for class attribute naming conventions (or mimic the existing code).

#### 3.4.2 Update the .cpp File

Define defaults for the new attributes in the constructor initialization list (if not a container with a sensible default constructor) in same order as they appear in the header. Add the new attributes to the `write(MPIPackBuffer&)`, `read(MPIUnpackBuffer&)`, and `write(ostream&)` functions, paying careful attention to the use of a consistent ordering.
3.5 Update Database Source ProblemDescDB.cpp

3.5.1 Augment/update get_<data_type>() Functions

The next update step involves extending the database retrieval functions in dakota.source/src/ProblemDescDB.cpp. These retrieval functions accept an identifier string and return a database attribute of a particular type, e.g., a RealVector:

```cpp
const RealVector& get_rv(const String& entry_name);
```

The implementation of each of these functions contains tables of possible entry_name values and associated pointer-to-member values. There is one table for each relevant top-level keyword, with the top-level keyword omitted from the names in the table. Since binary search is used to look for names in these tables, each table must be kept in alphabetical order of its entry names. For example,

```cpp
else if ((L = Begins(entry_name, "model."))) {
    if (dbRep->methodDBLocked)
        Locked_db();
#define P &DataModelRep::
static KW<RealVector, DataModelRep> RVdmo[] = {
    "nested.primary_response_mapping", P primaryRespCoeffs,
    "nested.secondary_response_mapping", P secondaryRespCoeffs,
    "surrogate.kriging_conmin_seed", P krigingConminSeed,
    "surrogate.kriging_correlations", P krigingCorrelations,
    "surrogate.kriging_max_correlations", P krigingMaxCorrelations,
    "surrogate.kriging_min_correlations", P krigingMinCorrelations
};
#undef P
KW<RealVector, DataModelRep> *kw;
if ((kw = (KW<RealVector, DataModelRep>*)Binsearch(RVdmo, L)))
    return dbRep->dataModelIter->dataModelRep->*kw->p;
```

is the "model" portion of ProblemDescDB::get_rv(). Based on entry_name, it returns the relevant attribute from a DataModel object. Since there may be multiple model specifications, the dataModelIter list iterator identifies which node in the list of DataModel objects is used. In particular, dataModelList contains a list of all of the data_model objects, one for each time a top-level model keyword was seen by the parser. The particular model object used for the data retrieval is managed by dataModelIter, which is set in a set_db_list_nodes() operation that will not be described here.

There may be multiple DataMethod, DataModel, DataVariables, DataInterface, and/or DataResponses objects. However, only one specification is currently allowed so a list of DataEnvironment objects is not needed. Rather, ProblemDescDB::environmentSpec is the lone DataEnvironment object.

To augment the get_<data_type>() functions, add table entries with new identifier strings and pointer-to-member values that address the appropriate data attributes from the Data class object. The style for the identifier strings is a top-down hierarchical description, with specification levels separated by periods and words separated with underscores, e.g., "keyword.group.specification.individual.specification". Use the dbRep->listIter->attribute syntax for variables, interface, responses, and method specifications. For example, the method_setting example attribute would be added to get_rv() as:

```cpp
{"method_name.method.setting", P methodSetting},
```

inserted at the beginning of the RVdmo array shown above (since the name in the existing first entry, i.e., "nested.primary_response_mapping", comes alphabetically after "method_name.method_setting").
3.6 Use get_<data_type>() Functions

At this point, the new specifications have been mapped through all of the database classes. The only remaining step is to retrieve the new data within the constructors of the classes that need it. This is done by invoking the get_<data_type>() function on the ProblemDescDB object using the identifier string you selected in Augment/update get_<data_type>() Functions. For example:

```cpp
const String& interface_type = problem_db.get_string("interface.type");
```

passes the "interface.type" identifier string to the ProblemDescDB::get_string() retrieval function, which returns the desired attribute from the active DataInterface object.

Warning

Use of the get_<data_type>() functions is restricted to class constructors, since only in class constructors are the data list iterators (i.e., dataMethodIter, dataModelIter, dataVariablesIter, dataInterfaceIter, and dataResponsesIter) guaranteed to be set correctly. Outside of the constructors, the database list nodes will correspond to the last set operation, and may not return data from the desired list node.

3.7 Update the Documentation

Doxygen comments should be added to the Data class headers for the new attributes, and the reference manual sections describing the portions of dakota.xml that have been modified should be updated by updating files in dakota.source/docs/KeywordMetaData/.dakota.xml, together with these metadata files generates the reference manual and GUI context-aware help documentation.
Chapter 4

Understanding Iterator Flow

This page explains the various phases comprising Iterator::run_iterator(). Prior to Iterator construction, when command-line options are parsed, Boolean run mode flags corresponding to PRERUN, RUN, and POSTRUN are set in ParallelLibrary. If the user didn’t specify any specific run modes, the default is for all three to be true (all phases will execute).

Iterator is constructed.

When called, run_iterator() sequences:

- **initialize_run()**: unconditionally called, virtual. Performs common initialization such as allocating workspaces, setting communicators and evaluation counts. When re-implementing this virtual, a derived class must call its nearest parent’s initialize_run(), typically before performing its own implementation steps.

- **Not implemented: pre-run input**

- **IF PRERUN, invoke pre_run()**: virtual function; default no-op. Purpose: derived classes should implement pre_run() if they are able to generate all parameter sets (variables) at once, separate from run(). Derived implementations should call their nearest parent’s pre_run(), typically before performing their own steps.

- **IF PRERUN, invoke pre_output()**: non-virtual function; if user requested, output variables to file.

- **Not implemented: run input**

- **IF RUN, invoke virtual function run()**: Purpose: at a minimum, evaluate parameter sets through computing responses; for iterators without pre/post capability, their entire implementation is in run() and this is a reasonable default for new Iterators.

- **Not implemented: run output**

- **IF POSTRUN, invoke post_input()**: virtual function, default only print helpful message on mode. Purpose: derived iterators supporting post-run input from file must implement to read file and populate variables/responses (and possibly best points) appropriately. Implementations must check if the user requested file input.

- **IF POSTRUN, invoke post_run()**: virtual function. Purpose: generate statistics / final results. Any analysis that can be done solely on tabular data read by post_input() can be done here. Derived re-implementations should call their nearest parent’s post-run(), typically after performing their specific post-run activities.

- **Not implemented: post-run output**
• `finalize_run()`: unconditionally called, virtual. Purpose: free workspaces. Default base class behavior is no-op, however, derived implementations should call their nearest parent’s `finalize_run` after performing their specialized portions.

Iterator is destructed.
Chapter 5

Interfacing with Dakota as a Library

5.1 Introduction

Tightly integrating or linking Dakota into another application can improve user experience by delivering a more unified, inter-operable software tool for optimization and UQ analyses, improving performance by eliminating file system-based interfaces, and reducing challenges with parallel computing inter-operation. This benefit has been realized within several Sandia and external simulation applications. This section describes how to link Dakota into another C++ application.

Dakota has two primary application programming interfaces (APIs). The LibraryEnvironment class facilitates use of Dakota as an algorithm service library within another application. In this case, the simulation application is providing a "front end" for Dakota. The second API, provided by the DirectApplicInterface class, provides an interface for Dakota to call the simulation code directly to perform function evaluations in core. This permits the simulation to be the "back end" for Dakota. The most complete library integration of Dakota would use both in combination, with the overall simulation framework providing both the front end and back end for Dakota, creating a sandwich, as loosely depicted here:

```
[------------
| Application
| |
| | { ----- |
| | { Dakota (LibraryEnvironment)
| |
| | { { Function evaluation callback to Application (via DirectApplicInterface)
| | | |
| | <------/
| |
| |
| | { -----
| |
| [------------
```

Attention

Dakota may be integrated as a library in other software applications subject to the terms of the GNU Lesser General Public License (LGPL). Refer to http://www.gnu.org/licenses/lgpl.html or the LICENSE file included with Dakota.

When Dakota is compiled and installed, the relevant library API headers are installed to CMAKE_INSTALL_PREFIX/include and the runtime libraries primarily to CMAKE_INSTALL_PREFIX/lib/ (on some platforms,
CHAPTER 5. INTERFACING WITH DAKOTA AS A LIBRARY

The core C/C++ code is in the library dakota_src, while Fortran code lives in the dakota_src_fortran library. Information on using the API in Dakota headers is included throughout this section, while considerations for configuring and linking against Dakota and its various required and optional third–party libraries are emphasized in the section Linking against the Dakota library.

Steps involved in integrating Dakota into another application typically include:

1. Writing C++ code for your application to instantiate, configure, and execute Dakota’s LibraryEnvironment ("front end”); see Basic Dakota library instantiation and Configuring Dakota operation.

2. Writing C++ code for Dakota to call a function in your application to perform function evaluations ("back end”); see Creating a simulator plugin interface.

3. Compiling Dakota and linking into your application (Linking against the Dakota library).

Several source code examples demonstrate Dakota library interfaces. The classes SIM::SerialDirectApplicInterface and SIM::ParallelDirectApplicInterface demonstrate serial and parallel simulation function evaluation plug-ins. The file library_mode.cpp includes a main program that exercises Dakota libraries in serial and parallel modes with these mock simulator programs, with various ways of configuring Dakota problem definition and operation. Finally, library_split.cpp demonstrates running Dakota as a library modular on an MPI sub-communicator.

5.2 Basic Dakota library instantiation

The function run_dakota_parse() in library_mode.cpp demonstrates the basic use of Dakota library objects as one would in another main application that embeds Dakota. In this example, Dakota is configured based on a typical user-provided text-based Dakota input file (the same that would be provided at the command line with dakota -i dakota_optimization.in) and a function evaluator derived from a DirectApplicInterface is plugged into the Dakota library environment.

First, an object of type ProgramOptions which manages top-level Dakota settings is instantiated and configured to specify the name of the Dakota user input file. Additional options for output and error redirection, restart operation, and more may be set via ProgramOptions. See its class documentation for details.

```cpp
std::string dakota_input_file = "dakota_optimization.in";
Dakota::ProgramOptions opts;
opts.input_file(dakota_input_file);
```

Next, a LibraryEnvironment is created, passing the desired settings from opts:

```cpp
Dakota::LibraryEnvironment env(opts);
```

This standard constructor will parse the specified input and create Dakota objects. It assumes many default settings, including that the parent application initialized MPI if running in parallel mode. (In this case, Dakota will detect whether MPI was initialized and not call MPI_Init or MPI_Finalize.) For more advanced use cases described below, alternate constructors allow constructing based on MPI communicators, with delayed finalization, and with Dakota database update function callbacks. Then the application’s function evaluator implementing Dakota’s DirectApplicInterface is plugged in with a convenience function serial_interface_plugin() or parallel_interface_plugin(). Finally, the Dakota analysis is run by calling

```cpp
env.execute();
```

The next two sections offer additional details on (1) alternative and supplementary ways to configure Dakota’s operation (Configuring Dakota operation) and (2) how to specialize Dakota’s DirectApplicInterface to provide a function evaluator plugin to Dakota (Creating a simulator plugin interface).
5.3 CONFIGURING DAKOTA OPERATION

Remarks

After **LibraryEnvironment** construction, all MPI communicator partitioning has been performed and the **ParallelLibrary** instance may be interrogated for parallel configuration data. For example, the lowest level communicators in Dakota’s multilevel parallel partitioning are the analysis communicators, which can be retrieved using:

```cpp
// retrieve the set of analysis communicators for simulation initialization:
// one analysis comm per ParallelConfiguration (PC), one PC per Model.
Array<MPI_Comm> analysis_comms = parallel_lib.analysis_intra_communicators();
```

These communicators can then be used for initializing parallel simulation instances when registering the plugin interface, where the number of MPI communicators in the array corresponds to one communicator per **ParallelConfiguration** instance. This is demonstrated below in Derivation.

5.3 Configuring Dakota operation

This section describes several alternate ways to initially set and later manipulate Dakota’s configuration, including alternatives to using a text-based input file. The algorithm configuration for a particular Dakota analysis run is managed in its **ProblemDescDB**, which can be populated via an input file, string literal, or C++ API, and later modified through Dakota’s C++ API. All Dakota objects then draw information from this database upon instantiation.

5.3.1 Input data parsing

The simplest way for an application to configure a Dakota analysis problem is to use Dakota’s normal input parsing system to populate its problem database (**ProblemDescDB**). This is done by providing standard Dakota input file syntax through the library interface, via either a file name or string literal. An advantage is that native Dakota syntax can be used, but disadvantages include the requirement for an additional input file beyond those already required by the parent application and that application users also need to know Dakota syntax.

The two ways to configure Dakota via input parsing are shown near the beginning of run_dakota_mixed() in library_mode.cpp. Here the **ProgramOptions** are set to either parse from a named file:

```cpp
Dakota::ProgramOptions opts;
opts.input_file(dakota_input_file);
```

or from a string literal provided by the wrapping application:

```cpp
string serial_input = "a Dakota input file ...";
opts.input_string(serial_input);
```

This library approach is coarse-grained in that input is parsed, objects constructed, and the environment is immediately ready to run. The next approaches are more modular.

5.3.2 Problem database insertion

A second approach to configuring Dakota’s operation is to bypass parsing phases and directly populate the **ProblemDescDB** with information on the methods, variables, interface, responses, etc., that define the Dakota analysis problem. This approach requires more interaction with Dakota classes and data structures. However, it can offer usability benefit when the integrating application does not want their users to interact with the full Dakota syntax, or efficiency benefit when for example there are a large number of variables to configure.

In the direct database population approach, Dakota **DataMethod**, **DataModel**, **DataVariables**, **DataInterface**, and **DataResponses** objects are instantiated and populated with the desired problem data. These objects are then
published to the problem database using insert_nodes(). An example of this approach is available in run_dakota_data() in library_mode.cpp, where the OPT++ Quasi-Newton method is configured to work on a plugin version of text_book or rosenBrock. The data objects are populated with their default values upon instantiation and are often sufficient for basic Dakota studies. Only the non-default values need to be specified. Moreover the default Dakota Model is a SingleModel, so this object need not be configured unless tailoring its configuration or using a more advanced model type. Refer to the DataMethod, DataModel, DataVariables, DataInterface, and DataResponses class documentation and source code for lists of attributes and their defaults. Here is an excerpt of run_dakota_data() that specifies the OPT++ solver after default construction of DataMethod:

Dakota::DataMethod dme;
Dakota::DataMethodRep* dmr = dme.data_rep();
dmr->methodName = Dakota::OPTPP_QNEWTON;

When using direct database population, it is critical to leave the database in an open, accessible state after initial construction. In this run_dakota_data() example, a flag check_bcast_construct is passed into the LibraryEnvironment constructor, indicating that it should not finalize the database and construct Dakota objects. Moreover, it is only necessary to populate the database on rank 0 of the MPI Comm on which Dakota is running. After database objects are inserted or adjusted, the LibraryEnvironment::done_modifying_db() function must be called before proceeding to execute. This synchronizes problem data across all ranks and constructs Dakota objects needed to run the specified analysis.

bool check_bcast_construct = false;
Dakota::LibraryEnvironment env(MPI_COMM_WORLD, opts, check_bcast_construct);
if (rank == 0) // insert/modify DB, then lock and proceed:
  env.done_modifying_db();
  env.execute();

5.3.3 Mixed mode, callbacks, and late updates

The LibraryEnvironment API also supports mixed approaches that combine the parsing of a Dakota input file (or input string literal) with direct database updates. This approach is motivated by large-scale applications where large vectors are cumbersome to specify in a Dakota input file or where later updates to an input template are needed. The example run_dakota_mixed() in library_mode.cpp demonstrates the combination of these more advanced approaches: (1) input text parsing, (2) database updates via a callback, (3) database updates via direct manipulation, and (4) further runtime updates to the Model before running.

First, a ProgramOptions class is instantiated and configured to parse either an input file or input string literal (as in earlier examples). The passed input data must contain all required inputs so the parser can validate them. Since vector data like variable values/bounds/tags, linear/nonlinear constraint coefficients/bounds, etc., are optional, these potentially large vector specifications can be omitted from the input file and updated later through the database API. Only the variable/response counts necessary for sizing, e.g.:

method
  linear_inequality_constraints = 500
variables
  continuous_design = 1000
responses
  objective_functions = 1
  nonlinear_inequality_constraints = 100000

and not the lists of values are required in this case. To update or add data after this initial parse, we use the ProblemDescDB::set() family of overloaded functions, e.g.

Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized to 1.
problem_db.set("variables.continuous_design.initial_point", drv);
where the string identifiers are the same identifiers used when pulling information from the database using one of the get,<datatype>() functions (refer to ProblemDescDB for a full list). However, the supported ProblemDescDB::set() options are a restricted subset of the database attributes, focused on vector inputs that can be large scale.

Second, the example demonstrates a user-provided callback function which Dakota will invoke after input parsing to update ProblemDescDB. In library_mode.cpp, callback_function() is a user-provided post-parse callback that implements the type Dakota::DbCallbackFunction.

static void callback_function(Dakota::ProblemDescDB* db, void *ptr);

When Dakota calls this function it will pass back pointers to the ProblemDescDB instance and to user-provided data, so the application may convey its settings by calling methods on the ProblemDescDB, optionally using the provided data. An example of a user data structure is demonstrated in callback_data. In this case, when the LibraryEnvironment is constructed, it is constructed with the input data to initially parse, the callback function, and to leave it unlocked for further updates:

bool done_with_db = false;
Dakota::LibraryEnvironment env(opts, done_with_db,
callback_function, &data);

Third, the example demonstrates changes to the database after parsing and callback-based updates. Again, these only need happen on Dakota’s rank 0 before finalizing the DB with LibraryEnvironment::done_modifying_db(). The example demonstrates:

1. Getting access to the database through env.problem_description_db()
2. Setting the database nodes to the appropriate method through problem_db.resolve_top_method()
3. Getting data from the DB with a get string array function: problem_db.get_sa("interface.application-analysis_drivers")
4. Setting update data with problem_db.set("variables.continuous_design.initial_point", ip);

After any of these three types updates, calling LibraryEnvironment::done_modifying_db() will broadcast any updates (including potentially large vector data and post-process specification data to fill in any vector defaults that have not yet been provided through either file parsing or direct updates. (Note: scalar defaults are handled in the Data class constructors.)

Fourth and finally, run_dakota_mixed() demonstrates modifying a Model’s data after database operations and interface plugin are complete. This involves finding the right Model (or other class) instance to modify, and directly adjusting its data through the public API. Since the database is finalized, any updates must be performed through direct set operations on the constructed objects. For example, to update other data such as variable values/bounds/tags or response bounds/targets/tags, refer to the set functions documented in Iterator and Model. As an example, the following code updates the active continuous variable values, which will be employed as the initial guess for certain classes of Iterators:

ModelList& all_models = problem_db.model_list();
Model& first_model = all_models.begin();
Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized to 1.
first_model.continuous_variables(drv);
Remarks

If performing such data updates within the constructor of a DirectApplicInterface extension/derivation (see Creating a simulator plugin interface), then this code is sufficient since the database is unlocked, the active list nodes of the ProblemDescDB have been set for you, and the correct method/model/variables/interface/responses specification instance will get updated. The difficulty in this case stems from the order of instantiation. Since the Variables and Response instances are constructed in the base Model class, prior to construction of Interface instances in derived Model classes, database information related to Variables and Response objects will have already been extracted by the time the Interface constructor is invoked and the database update will not propagate.

Therefore, it is preferred to perform these database set operations at a higher level (e.g., within your main program), prior to allowing Environment to broadcast, construct, and execute, such that instantiation order is not an issue. However, in this case, it is necessary to explicitly manage the list nodes of the ProblemDescDB using a specification instance identifier that corresponds to an identifier from the input file, e.g.:

\[
\text{problem}_{-}\text{db.set}_{-}\text{db}_{-}\text{variables}_{-}\text{node}("MY\_VARIABLES\_ID");}
\]
\[
\text{Dakota::RealVector drv(1000, 1.); // vector of length 1000, values initialized to 1.}
\]
\[
\text{problem}_{-}\text{db.set}_{-}\text{db}_{-}\text{variables}_{-}\text{continuous}_{-}\text{design}_{-}\text{initial}_{-}\text{point"}, drv);
\]

Alternatively, rather than setting just a single data node, all data nodes may be set using a method specification identifier:

\[
\text{problem}_{-}\text{db.set}_{-}\text{db}_{-}\text{list}_{-}\text{nodes}("MY\_METHOD\_ID");}
\]

since the method specification is responsible for identifying a model specification, which in turn identifies variables, interface, and responses specifications. If hard-wiring specification identifiers is undesirable, then

\[
\text{problem}_{-}\text{db.resolve}_{-}\text{top}_{-}\text{method}();}
\]

can also be used to deduce the active method specification and set all list nodes based on it. This is most appropriate in the case where only single specifications exist for method/model/variables/interface/responses. This is the approach demonstrated in run_dakota_mixed(). In each of these cases, setting list nodes unlocks the corresponding portions of the database, allowing set/get operations.

5.4 Creating a simulator plugin interface

The DirectApplicInterface class provides an interface for Dakota to call the simulation code directly to perform function evaluations mapping variables to responses. This provides the "back end" for Dakota to call back to the simulation framework. Two approaches to defining this direct interface are described here. The first is less common, while the second is recommended when possible.

5.4.1 Extension

The first approach involves extending one of the existing DirectApplicInterface subclasses (TestDriverInterface, MatlabInterface, etc.) to support additional direct simulation interfaces. For example, Dakota algebraic test problems are implemented in TestDriverInterface. One could add additional direct functions to Dakota in TestDriverInterface::derived_map_ac(). In addition, TestDriverInterface::derived_map_if() and TestDriverInterface::derived_map_of() can be extended to perform pre- and post-processing tasks if desired, but this is not required.

While this approach is the simplest, it has the disadvantage that the Dakota library will need to be recompiled when the simulation or its direct interface is modified. If it is desirable to maintain the independence of the Dakota library from the host application, then the derivation approach described in the next section should be employed.
5.4. CREATING A SIMULATOR PLUGIN INTERFACE

Remarks

If the new direct evaluation function implementation will not be a member function of one of the Dakota classes, then the following prototype should be used in order to pass the required data:

```cpp
int sim(const Dakota::Variables& vars, const Dakota::ActiveSet& set, Dakota::Response& response);
```

If the new function will be a member function, e.g., in `TestDriverInterface`, then this can be simplified to

```cpp
int sim();
```

since the data access can be performed through the `DirectApplicInterface` class attributes.

5.4.2 Derivation

The second approach is to derive a new interface from `DirectApplicInterface` and redefine several virtual functions. As demonstrated in `SIM::SerialDirectApplicInterface` and `SIM::ParallelDirectApplicInterface`, a typical derived class declaration might be

```cpp
namespace SIM {

class SerialDirectApplicInterface: public Dakota::DirectApplicInterface {

public:

    // Constructor and destructor
    SerialDirectApplicInterface(const Dakota::ProblemDescDB& problem_db);
    ~SerialDirectApplicInterface();

    // Virtual function redefinitions
    int derived_map_if(const Dakota::String& if_name);
    int derived_map_ac(const Dakota::String& ac_name);
    int derived_map_of(const Dakota::String& of_name);

private:

    // Data

} // class SerialDirectApplicInterface

SIM::SerialDirectApplicInterface();

} // namespace SIM
```

where the new derived class resides in the simulation’s namespace. Similar to the case of `Extension`, the `DirectApplicInterface::derived_map_ac()` function is the required redefinition, and `DirectApplicInterface::derived_map_if()` and `DirectApplicInterface::derived_map_of()` are optional.

Typically the new `derived_map_ac()` implementation delegates to the main simulation application for a function evaluation. Here Dakota variables would get mapped into the simulation’s data structures, the simulation executed, and derived response data computed for return to Dakota.

Once a derived application class is created, it must be plugged in, or registered, with the appropriate `Interface` in the `LibraryEnvironment`. In MPI cases where Dakota is potentially managing concurrent evaluations of the simulation, the plugin must be configured to run on the right MPI sub-communicator, or Dakota analysis comm. The simpler case is demonstrated in `serial_interface_plugin()` in `library_mode.cpp`, while a more advanced case using the analysis communicator is shown in `parallel_interface_plugin()`.

The Dakota `LibraryEnvironment` provides a convenience function to plugin an `Interface`. This example will replace any interface found matching the given model, interface, and analysis driver with the passed plugin interface:
std::string model_type(""s; // demo: empty string will match any model type
std::string interface_type(""direct");
std::string an_driver("plugin_rosenbrook");
Dakota::ProblemDescDB problem_db = env.problem_description_db();
Dakota::Interface* serial_iface =
    new SIM::SerialDirectApplicInterface(problem_db);
bool plugged_in =
    env.plugin_interface(model_type, interface_type, an_driver, serial_iface);

The LibraryEnvironment also provides convenience functions that allow the client to iterate the lists of available interfaces or models for more advanced cases. For instance if the client knows there is only a single interface active, it could get the list of available interfaces of length 1 and plugin to the first one. In the more advanced case where the simulation interface instance should manage parallel simulations within the context of an MPI communicator, one should pass in the relevant analysis communicator(s) to the derived constructor. For the latter case of looping over a set of models, the simplest approach of passing a single analysis communicator would use code similar to

Dakota::ModelList filt_models =
    env.filtered_model_list("single", "direct", "plugin_text_book");
Dakota::ProblemDescDB problem_db = env.problem_description_db();
Dakota::ModelIter ml_iter;
for (ml_iter = filt_models.begin(); ml_iter != filt_models.end(); ++ml_iter)
    // set DB nodes to input specification for this Model
    problem_db.set_db_model_nodes(ml_iter->model_id());
Dakota::Interface* model_interface = ml_iter->derived_interface();
    // Parallel case: plug in derived Interface object with an analysisComm.
    // Note: retrieval and passing of analysisComm is necessary only if
    // parallel operations will be performed in the derived constructor.
    // retrieve the currently active analysisComm from the Model. In the most
    // general case, need an array of Comms to cover all Model configurations.
    const MPI_Comm analysis_comm = ml_iter->analysis_comm();
    // don’t increment ref count since no other envelope shares this letter
    model_interface.assign_rep(new
        SIM::ParallelDirectApplicInterface(problem_db, analysis_comm, false));
    }

The file library_mode.cpp demonstrates each of these approaches. Since a Model may be used in multiple parallel contexts and may therefore have a set of parallel configurations, a more general approach would extract and pass an array of analysis communicators to allow initialization for each of the parallel configurations.

New derived direct interface instances inherit various attributes of use in configuring the simulation. In particular, the ApplicationInterface::parallelLib reference provides access to MPI communicator data (e.g., the analysis communicators discussed above), DirectApplicInterface::analysisDrivers provides the analysis driver names specified by the user in the input file, and DirectApplicInterface::analysisComponents provides additional analysis component identifiers (such as mesh file names) provided by the user which can be used to distinguish different instances of the same simulation interface. It is worth noting that inherited attributes that are set as part of the parallel configuration (instead of being extracted from the ProblemDescDB) will be set to their defaults following construction of the base class instance for the derived class plug-in. It is not until run-time (i.e., within derived_map_if/derived_map_ac/derived_map_of) that the parallel configuration settings are re-propagated to the plug-in instance. This is the reason that the analysis communicator should be passed in to the constructor of a parallel plug-in, if the constructor will be responsible for parallel application initialization.
5.5 Retrieving data after a run

After executing the Dakota Environment, final results can be obtained through the use of Environment::variables_results() and Environment::response_results(), e.g.:

```cpp
// retrieve the final parameter values
const Variables& vars = env.variables_results();

// retrieve the final response values
const Response& resp = env.response_results();
```

In the case of optimization, the final design is returned, and in the case of uncertainty quantification, the final statistics are returned. Dakota has a prototype results database, which will eventually provide better access to the results from a study.

5.6 Linking against the Dakota library

This section presumes Dakota has been configured with CMake, compiled, and installed to a CMAKE_INSTALL_ALLPREFIX using make install or equivalent. The Dakota libraries against which you must link will typically install to CMAKE_INSTALL_PREFIX/bin/ and CMAKE_INSTALL_PREFIX/lib/, while headers are provided in CMAKE_INSTALL_PREFIX/include/. The core Dakota C and C++ code is in the library dakota-src, while Fortran code lives in the dakota-src_fortran library. Runtime libraries for any configure-enabled Dakota third-party software components (such as DOT, NPSOL, OPT++, LHS, etc.) are also installed to the lib/ directory. Applications link against these Dakota libraries by specifying appropriate include and link directives.

There are two primary ways to determine the necessary Dakota-related libraries and link order for linking your application. First, when running CMake, a list of required Dakota and Dakota-included third-party libraries will be output to the console, e.g.,

```sh
-- Dakota_LIBRARIES: dakota_src;dakota_src_fortran;nidr;teuchos;pecos;pecos_src;lhs;mods;mod;dfitpack;sparselg
```

While external dependencies will be output as:

```sh
-- Dakota_TPL_LIBRARIES: /usr/lib64/libcurl.so;/usr/lib64/openmpi/lib/libmapi_cxx.so;debug;/usr/lib64/libbz.so;
```

Note that depending on how you configured Dakota, some libraries may be omitted from these lists (for example commercial add-ons NPSOL, DOT, and NLPLQ), or additional libraries may appear.

A second option is to check which libraries appear in CMAKE_INSTALL_PREFIX/bin/ CMAKE_INSTALL_PREFIX/lib/, or more accurately, see the file Makefile.export.Dakota in the Dakota build/src/ or installation include/ directory. Here are some additional notes on specific libraries:

- Some Boost libraries (boost_regex, boost_filesystem, boost_system, boost_serialization) are required, and other Boost library components may be required depending on configuration, e.g., boost-signals when configuring with HAVE_ACRO BOOL=TRUE

- System compiler and math libraries may need to be included, as may additional system libraries such as Expat and Curl, depending on how Dakota is configured.

- If configuring with graphics, you will need to add the dakota_sciplot library and system X libraries (partial list here):

  ```sh
  -lXpm -lXm -lXt -lXmu -lXp -lXext -lX11 -lSM -lICE
  ```
• When configuring with AMPL (HAVEAMPL:BOOL=ON), the AMPL solver library may require d1, funcadd0, -o and f1 libraries. We have experienced problems with the creation of libamplsolver.a on some platforms; use the dakota-users mailing list to get help with any problems related to this.

• Optional library GSL (discouraged due to GPL license) and if linking with system-provided GSL, gslcblas may be needed if Dakota was configured with them.

• Newmat: as of Dakota 5.2, -lnewmat is no longer required

Finally, it is important to use the same C++ compiler (possibly an MPI wrapper) for compiling Dakota and your application and potentially include Dakota-related preprocessor defines as emitted by CMake during compilation of Dakota and included in Makefile.export.Dakota. This ensures that the platform configuration settings are properly synchronized across Dakota and your application.
Chapter 6
Performing Function Evaluations

Performing function evaluations is one of the most critical functions of the Dakota software. It can also be one of the most complicated, as a variety of scheduling approaches and parallelism levels are supported. This complexity manifests itself in the code through a series of cascaded member functions, from the top level model evaluation functions, through various scheduling routines, to the low level details of performing a system call, fork, or direct function invocation. This section provides an overview of the primary classes and member functions involved.

6.1 Synchronous function evaluations

For a synchronous (i.e., blocking) mapping of parameters to responses, an iterator invokes Model::evaluate() to perform a function evaluation. This function is all that is seen from the iterator level, as underlying complexities are isolated. The binding of this top level function with lower level functions is as follows:

- Model::evaluate() utilizes Model::derived_evaluate() for portions of the response computation specific to derived model classes.
- Model::derived_evaluate() directly or indirectly invokes Interface::map().
- Interface::map() utilizes ApplicationInterface::derived_map() for portions of the mapping specific to derived application interface classes.

6.2 Asynchronous function evaluations

For an asynchronous (i.e., nonblocking) mapping of parameters to responses, an iterator invokes Model::evaluate_nowait() multiple times to queue asynchronous jobs and then invokes either Model::synchronize() or Model::synchronize_nowait() to schedule the queued jobs in blocking or nonblocking fashion. Again, these functions are all that is seen from the iterator level, as underlying complexities are isolated. The binding of these top level functions with lower level functions is as follows:

- Model::evaluate_nowait() utilizes Model::derived_evaluate_nowait() for portions of the response computation specific to derived model classes.
- This derived model class function directly or indirectly invokes Interface::map() in asynchronous mode, which adds the job to a scheduling queue.
- Model::synchronize() or Model::synchronize_nowait() utilize Model::derived_synchronize() or Model::derived_synchronize_nowait() for portions of the scheduling process specific to derived model classes.
• These derived model class functions directly or indirectly invoke Interface::synch() or Interface::synch_nowait().

• For application interfaces, these interface synchronization functions are responsible for performing evaluation scheduling in one of the following modes: master dynamic, peer dynamic or peer static.

• **NOTE:** The Interface evaluation scheduling in Dakota was refactored for releases 5.4 and 6.0. Discussion of the new Interface-related functions is currently missing here.

### 6.3 Analyses within each function evaluation

**NOTE:** The Interface evaluation scheduling in Dakota was refactored for releases 5.4 and 6.0. Discussion of the new Interface-related functions for analyses is currently missing here.

The discussion above covers the parallelism level of concurrent function evaluations serving an iterator. For the parallelism level of concurrent analyses serving a function evaluation, similar schedulers are involved to support synchronous local, asynchronous local, message passing, and hybrid modes. Not all of the schedulers are elevated to the ApplicationInterface level since the system call and direct function interfaces do not yet support nonblocking local analyses (and therefore support synchronous local and message passing modes, but not asynchronous local or hybrid modes). Fork interfaces, however, support all modes of analysis parallelism.
Chapter 7

Working with Variable Containers and Views

Variable views control the subset of variable types that are active and inactive within a particular iterative study. For design optimization and uncertainty quantification (UQ), for example, the active variables view consists of design or uncertain types, respectively, and any other variable types are carried along invisible to the iterative algorithm being employed. For parameter studies and design of experiments, however, a variable subset view is not imposed and all variables are active. Selected UQ methods can also be toggled into an “All” view using the active all variables input specification. When not in an All view, finer gradations within the uncertain variable sets are also relevant: probabilistic methods (reliability, stochastic expansion) view aleatory uncertain variables as active, nonprobabilistic methods (interval, evidence) view epistemic uncertain variables as active, and a few UQ methods (sampling) view both as active. In a more advanced NestedModel use case such as optimization under uncertainty, design variables are active in the outer optimization context and the uncertain variables are active in the inner UQ context, with an additional requirement on the inner UQ level to return derivatives with respect to its “inactive” variables (i.e., the design variables) for use in the outer optimization loop.

For efficiency, contiguous arrays of data store variable information for each of the domain types (continuous, discrete integer, and discrete real), but active and inactive views into them permit selecting subsets in a given context. This management is encapsulated into the Variables and SharedVariablesData classes. This page clarifies concepts of relaxed (formerly merged) vs. mixed, fine-grained vs. aggregated types, domain types, and views into contiguous arrays.

We begin with an overview of the storage and management concept, for which the following two sections describe the storage of variable values and meta-data about their organization, used in part to manage views. They are intended to communicate rationale to maintainers of Variables and SharedVariablesData classes. The final section provides a discussion of active and inactive views.

7.1 Storage in Variables

As described in the Main Page Variables, a Variables object manages variable types (design, aleatory uncertain, epistemic uncertain, and state) and domain types (continuous, discrete integer, and discrete real) and supports different approaches to either distinguishing among these types or aggregating them. Two techniques are used in cooperation to accomplish this management: (1) class specialization (RelaxedVariables or MixedVariables) and (2) views into contiguous variable arrays. The latter technique is used whenever it can satisfy the requirement, with fallback to class specialization when it cannot. In particular, aggregation or separation of variable types can be accomplished with views, but for aggregation or separation of variable domains, we must resort to class
specialization in order to relax discrete domain types. In this class specialization, a RelaxedVariables object combines continuous and discrete types (relaxing integers to reals) whereas a MixedVariables object maintains the integer/real distinction throughout.

The core data for a Variables instance is stored in a set of three contiguous arrays, corresponding to the domain types: allContinuousVars, allDiscreteIntVars, and allDiscreteRealVars, unique to each Variables instance.

Within the core variable data arrays, data corresponding to different aggregated variable types are stored in sequence for each domain type:

- continuous: [design, aleatory uncertain, epistemic uncertain, state]
- discrete integer: [design, aleatory uncertain, (epistemic uncertain), state]
- discrete real: [design, aleatory uncertain, (epistemic uncertain), state]

Note there are currently no epistemic discrete variables. This domain type ordering (continuous, discrete integer, discrete real) and aggregated variable type ordering (design, aleatory uncertain, epistemic uncertain, state) is preserved whenever distinct types are flattened into single contiguous arrays. Note that the aleatory and epistemic uncertain variables contain sub-types for different distributions (e.g., normal, uniform, histogram, poisson), and discrete integer types include both integer ranges and integer set sub-types. All sub-types are ordered according to their order of appearance in dakota.input.nspec.

When relaxing in MixedVariables, the allContinuousVars will also aggregate the discrete types, such that they contain ALL design, then ALL uncertain, then ALL state variables, each in aggregated type order; the allDiscrete-IntVars and allDiscreteRealVars arrays are empty.

### 7.2 Storage in SharedVariablesData

Each Variables instance contains a reference-counted SharedVariablesData object that stores information on the variables configuration. This configuration data includes counts, types, IDs, and labels, which are often the same across many Variables instances. Thus, SharedVariablesData is intended to reduce the memory footprint by allowing the sharing of a single copy of redundant information among different Variables instances.

One of the purposes of this shared information is to support mappings between variable types, IDs, and indices into the storage arrays. Variable "types" refer to the fine-grained variable types a user would specify in an input file, as enumerated in DataVariables.hpp, e.g., CONTINUOUS, DESIGN, WEIBULL, UNCERTAIN, DISCRETE, STATE, RANGE, etc. variablesComponents is a map from these variable types to counts of how many are present.

In contrast, the variablesCompsTotals array stores total counts of each "aggregated type" (design, aleatory uncertain, epistemic uncertain, state) which might be selected to be active in a given view. Thus this array has length 12 to track the combinations of three domain type storage arrays with four possible aggregated variable types: \{continuous, discrete integer, discrete real\} x \{design, aleatory uncertain, epistemic uncertain, state\}. For example, the first entry of this array stores the number of continuous design variables, the second the number of discrete integer design (including both discrete design range and discrete design set integer types), and the last the number of discrete real state variables.

The arrays allContinuousTypes, allDiscreteIntTypes, and allDiscreteRealTypes are sized to match the corresponding core domain type storage arrays. They track the fine-grained variable type stored in that entry of the data array (since when relaxed, the continuous array may be storing data corresponding to discrete data).

Finally allContinuousIds stores the 1-based IDs of the variables stored in the allContinuousVars array, i.e., the variable number of all the problem variables considered as a single contiguous set, in aggregate type order. For relaxed (formerly merged) views, relaxedDiscreteIds stores the 1-based IDs of the variables which have been relaxed into the continuous array.
7.3. ACTIVE AND INACTIVE VIEWS

These counts, types, and IDs are most commonly used within the Model classes for mappings between variables objects at different levels of a model recursion. See, for example, the variable mappings in the NestedModel constructor.

7.3 Active and inactive views

The pair SharedVariablesDataRep::variablesView tracks the active and inactive views of the data, with values taken from the enum in DataVariables.hpp. The valid values include EMPTY and the combinations \{relaxed, mixed\} x \{all, design, aleatory uncertain, epistemic uncertain, uncertain, state\}. The ALL cases indicate aggregation of the design, aleatory uncertain, epistemic uncertain, and state types, whereas the DISTINCT cases indicate either no aggregation (design, aleatory uncertain, epistemic uncertain, state) or reduced aggregation (aleatory+epistemic uncertain). The active view is determined by the algorithm in use, managed in Variables::getView(). Any inactive view is set based on higher level iteration within a model recursion (e.g., a NestedModel), which enables lower level iteration to return derivatives with respect to variables that are active at the higher level. In the case where there is no higher level iteration, then the inactive view will remain EMPTY. It is important to stress that "inactive" at one level corresponds to active at another, and therefore the inactive set of variables should not be interpreted as the strict complement of the active set of variables; rather, active and inactive are both subsets whose union may still be a subset of the total container (more precise terminology might involve "primary" active and "secondary" active or similar). An active complement view could potentially be supported in the future, should the need arise, although this view would require management of non-contiguous portions of the aggregated arrays.

Given these groupings (views), the active and inactive subsets of the allContinuousVars, allDiscreteIntVars, and allDiscreteRealVars arrays are always contiguous, permitting vector views of the underlying data using either Teuchos::View (for numerical vectors) or Boost.MultiArray (for book-keeping arrays) views.

When a Variables envelope is constructed, its letter is initialized to either a RelaxedVariables or MixedVariables object depending on the active view. The derived classes size the contiguous storage arrays to accommodate all the problem variables, and then initialize active views into them, which could involve either subsets (DISTINCT active views) or views of the full arrays (ALL active views). Inactive views, on the other hand, are initialized during construction of a model recursion (e.g., a call to Model::inactiveView() in the NestedModel constructor). Thus, active variable subsets are always available but inactive variable subsets will be EMPTY prior to them being initialized within a Model recursion.

Accessors for continuous variables include:

- continuous_variables(): returns the active view which might return all (ALL views) or a subset (DISTINCT views) such as design, uncertain, only aleatory uncertain, etc.
- inactive_continuous_variables(): returns the inactive view which is either a subset or empty
- all_continuous_variables(): returns the full vector allContinuousVars

and this pattern is followed for active/inactive/all access to discrete_int_variables() and discrete_real_variables() as well as for labels, IDs, and types in SharedVariablesData and variable bounds in Constraints.

Member SurfpackApproximation::build()

Right now, we’re completely deleting the old data and then recopying the current data into a SurfData object. This was just the easiest way to arrive at a solution that would build and run. This function is frequently called from addPoint rebuild, however, and it’s not good to go through this whole process every time one more data point is added.

Member SurfpackApproximation::hessian (const RealVector &c_vars)

Make this acceptably efficient

Chapter 10

Class Index

10.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

**ActiveSet**
Container class for active set tracking information. Contains the active set request vector and the derivative variables vector ........................................... 179

**ActiveSubspaceModel**
Active subspace model for input (variable space) reduction ........................................... 181

**AdaptedBasisModel**
Adapted basis model for input (variable space) reduction ........................................... 188

**AddAttributeVisitor**
Objects of this class are called by boost::appy_visitor to add attributes to HDF5 objects ... 193

**Analyzer**
Base class for NonD, DACE, and ParamStudy branches of the iterator hierarchy ............... 193

**ApplicationInterface**
Derived class within the interface class hierarchy for supporting interfaces to simulation codes 202

**Approximation**
Base class for the approximation class hierarchy ...................................................... 217

**ApproximationInterface**
Derived class within the interface class hierarchy for supporting approximations to simulation-based results .............................................................. 224

**APPSEvalMgr**
Evaluation manager class for APPSPACK ................................................................. 231

**AppsTraits**
Wrapper class for HOPSPACK ..................................................................................... 233

**ApreproWriter**
Utility used in derived write_core to write in aprepro format ..................................... 235

**AttachScaleVisitor**
Objects of this class are called by boost::appy_visitor to add dimension scales (RealScale or StringScale) to HDF5 datasets ......................................................... 235

**BaseConstructor**
Dummy struct for overloading letter-envelope constructors ......................................... 236

**BootstrapSampler< Data >**
Actual bootstrap sampler implementation for common data types .............................. 236

10.1. CLASS LIST

DataModel
Handle class for model specification data ........................................... 311
DataModelRep
Body class for model specification data .............................................. 312
DataResponses
Handle class for responses specification data ..................................... 318
DataResponsesRep
Body class for responses specification data ........................................ 319
DataTransformModel
Data transformation specialization of RecastModel ............................... 323
DataVariables
Handle class for variables specification data ....................................... 329
DataVariablesRep
Body class for variables specification data ........................................... 330
DDACEDesignCompExp
Wrapper class for the DDACE design of experiments library .................. 344
DerivInformedPropCovLogitTK\(< V, M >$
Dakota transition kernel that updates proposal covariance based on derivatives (for logit random walk case) ............................................. 348
DerivInformedPropCovTK\(< V, M >$
Dakota transition kernel that updates proposal covariance based on derivatives (for random walk case) .................................................. 349
DirectApplicInterface
Derived application interface class which spawns simulation codes and testers using direct procedure calls ................................................. 350
DiscrepancyCorrection
Base class for discrepancy corrections ................................................ 354
DLSolverTraits
A version of TraitsBase specialized for DLSolver .................................. 358
DOTTraits
Wrapper class for the DOT optimization library ................................... 359
JEGAOptimizer::Driver
A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm ......................................... 360
EffGlobalMinimizer ................................................................. 362
EffGlobalTraits
Implementation of Efficient Global Optimization/Least Squares algorithms 364
EmbedHybridMetaIterator
Meta-iterator for closely-coupled hybrid iteration, typically involving the embedding of local search methods within global search methods 365
Environment
Base class for the environment class hierarchy ................................... 367
NomadOptimizer::Evaluator
NOMAD-based Evaluator class ........................................................ 371
JEGAOptimizer::Evaluator
An evaluator specialization that knows how to interact with Dakota ......... 374
JEGAOptimizer::EvaluatorCreator
A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator .................................................. 379
<table>
<thead>
<tr>
<th>Class Name</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecutableEnvironment</td>
<td>Environment corresponding to execution as a stand-alone application</td>
<td>380</td>
</tr>
<tr>
<td>ExperimentData</td>
<td>Interpolation method for interpolating between experimental and model data. I need to work on inputs/outputs to this method. For now, this assumes interpolation of functional data</td>
<td>381</td>
</tr>
<tr>
<td>ExperimentResponse</td>
<td>Container class for response functions and their derivatives. ExperimentResponse provides the body class</td>
<td>389</td>
</tr>
<tr>
<td>FileReadException</td>
<td>Base class for Dakota file read exceptions (to allow catching both tabular and general file truncation issues)</td>
<td>391</td>
</tr>
<tr>
<td>ForkApplicInterface</td>
<td>Derived application interface class which spawns simulation codes using fork/execvp/waitpid</td>
<td>391</td>
</tr>
<tr>
<td>FSUDesignCompExp</td>
<td>Wrapper class for the FSUDace QMC/CVT library</td>
<td>393</td>
</tr>
<tr>
<td>FunctionEvalFailure</td>
<td>Exception class for function evaluation failures</td>
<td>397</td>
</tr>
<tr>
<td>GaussProcApproximation</td>
<td>Derived approximation class for Gaussian Process implementation</td>
<td>397</td>
</tr>
<tr>
<td>GeneralReader</td>
<td>Utility used in derived read_core to read in generic format</td>
<td>402</td>
</tr>
<tr>
<td>GeneralWriter</td>
<td>Utility used in derived write_core to write in generic format</td>
<td>402</td>
</tr>
<tr>

<tr>
<td>HierarchSurrModel</td>
<td>Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity)</td>
<td>415</td>
</tr>
<tr>
<td>Interface</td>
<td>Base class for the interface class hierarchy</td>
<td>421</td>
</tr>
<tr>
<td>Iterator</td>
<td>Base class for the iterator class hierarchy</td>
<td>431</td>
</tr>
<tr>
<td>IteratorScheduler</td>
<td>This class encapsulates scheduling operations for concurrent sub-iteration within an outer level context (e.g., meta-iteration, nested models)</td>
<td>446</td>
</tr>
<tr>
<td>JEGAOptimizer</td>
<td>A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA)</td>
<td>452</td>
</tr>
<tr>
<td>JEGATraits</td>
<td>A version of TraitsBase specialized for John Eddy’s Genetic Algorithms (JEGA)</td>
<td>458</td>
</tr>
</tbody>
</table>
### 10.1. CLASS LIST

<table>
<thead>
<tr>
<th>Class Name</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>LabelsWriter</td>
<td>Utility used in derived write_core to write labels in tabular format</td>
<td>459</td>
</tr>
<tr>
<td>LeastSq</td>
<td>Base class for the nonlinear least squares branch of the iterator hierarchy</td>
<td>459</td>
</tr>
<tr>
<td>LibraryEnvironment</td>
<td>Environment corresponding to execution as an embedded library</td>
<td>462</td>
</tr>
<tr>
<td>LightWtBaseConstructor</td>
<td>Dummy struct for overloading constructors used in on-the-fly Model instantiations</td>
<td>465</td>
</tr>
<tr>
<td>MatchesWC</td>
<td>Predicate that returns true when the passed path matches the wild_card with which it was configured. Currently supports * and ?</td>
<td>465</td>
</tr>
<tr>
<td>MatlabInterface</td>
<td></td>
<td>466</td>
</tr>
<tr>

<tr>
<td>Minimizer</td>
<td>Base class for the optimizer and least squares branches of the iterator hierarchy</td>
<td>469</td>
</tr>
<tr>
<td>MixedVarConstraints</td>
<td>Derived class within the Constraints hierarchy which separates continuous and discrete variables (no domain type array merging)</td>
<td>476</td>
</tr>
<tr>
<td>MixedVariables</td>
<td>Derived class within the Variables hierarchy which separates continuous and discrete variables (no domain type array merging)</td>
<td>477</td>
</tr>
<tr>
<td>Model</td>
<td>Base class for the model class hierarchy</td>
<td>479</td>
</tr>
<tr>
<td>MPIManager</td>
<td>Class MPIManager to manage Dakota’s MPI world, which may be a subset of MPI_COMM_WORLD</td>
<td>517</td>
</tr>
<tr>
<td>MPIPackBuffer</td>
<td>Class for packing MPI message buffers</td>
<td>518</td>
</tr>
<tr>
<td>MPIUnpackBuffer</td>
<td>Class for unpacking MPI message buffers</td>
<td>520</td>
</tr>
<tr>
<td>NCSUTraits</td>
<td>Wrapper class for the NCSU DIRECT optimization library</td>
<td>522</td>
</tr>
<tr>
<td>NestedModel</td>
<td>Derived model class which performs a complete sub-iterator execution within every evaluation of the model</td>
<td>523</td>
</tr>
<tr>
<td>NIDRProblemDescDB</td>
<td>The derived input file database utilizing the new IDR parser</td>
<td>534</td>
</tr>
<tr>
<td>NL2Res</td>
<td>Auxiliary information passed to calc_r and calc_j via ur</td>
<td>539</td>
</tr>
<tr>
<td>NL2SOLLeastSqTraits</td>
<td>Wrapper class for the NL2SOL nonlinear least squares library</td>
<td>540</td>
</tr>
<tr>
<td>NLPQLPAttributes</td>
<td>Wrapper class for the NLPQLP optimization library, Version 2.0</td>
<td>541</td>
</tr>
<tr>
<td>NLSSOLLeastSqTraits</td>
<td>Wrapper class for the NLSSOL nonlinear least squares library</td>
<td>542</td>
</tr>
<tr>
<td>NoDBBaseConstructor</td>
<td>Dummy struct for overloading constructors used in on-the-fly instantiations without ProblemDescDB support</td>
<td>543</td>
</tr>
<tr>

<td>Wrapper class for NOMAD Optimizer</td>
<td></td>
</tr>
<tr>
<td>NonD</td>
<td>Base class for all nondeterministic iterators (the DAKOTA/UQ branch)</td>
<td></td>
</tr>
<tr>
<td>NonDAdaptImpSampling</td>
<td>Class for the Adaptive Importance Sampling methods within DAKOTA</td>
<td></td>
</tr>
<tr>
<td>NonDAdaptiveSampling</td>
<td>Class for testing various Adaptively sampling methods using geometric, statistical, and topological information of the surrogate</td>
<td></td>
</tr>
<tr>
<td>NonDBayesCalibration</td>
<td>Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data</td>
<td></td>
</tr>
<tr>
<td>NonDCalibration</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NonDCubature</td>
<td>Derived nondeterministic class that generates N-dimensional numerical cubature points for evaluation of expectation integrals</td>
<td></td>
</tr>
<tr>
<td>NonDDREAMBayesCalibration</td>
<td>Bayesian inference using the DREAM approach</td>
<td></td>
</tr>
<tr>
<td>NonDExpansion</td>
<td>Base class for polynomial chaos expansions (PCE) and stochastic collocation (SC)</td>
<td></td>
</tr>
<tr>
<td>NonDGlobalEvidence</td>
<td>Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ</td>
<td></td>
</tr>
<tr>
<td>NonDGlobalInterval</td>
<td>Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification</td>
<td></td>
</tr>
<tr>
<td>NonDGlobalReliability</td>
<td>Class for global reliability methods within DAKOTA/UQ</td>
<td></td>
</tr>
<tr>
<td>NonDGlobalSingleInterval</td>
<td>Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification</td>
<td></td>
</tr>
<tr>
<td>NonDGPImpSampling</td>
<td>Class for the Gaussian Process-based Importance Sampling method</td>
<td></td>
</tr>
<tr>
<td>NonDGPMsABayesCalibration</td>
<td>Generates posterior distribution on model parameters given experiment data</td>
<td></td>
</tr>

10.1. CLASS LIST

NonDLocalInterval
Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification ....................................................... 625

NonDLocalReliability
Class for the reliability methods within DAKOTA/UQ ....................................... 627

NonDLocalSingleInterval
Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification ....................................................... 637

NonDMultilevelPolynomialChaos
Nonintrusive polynomial chaos expansion approaches to uncertainty quantification ........ 638

NonDMultilevelSampling
Performs Multilevel Monte Carlo sampling for uncertainty quantification ............... 642

NonDMultilevelStochCollocation
Nonintrusive stochastic collocation approaches to uncertainty quantification ............ 652

NonDPOLFDarts
Base class for POF Dart methods within DAKOTA/UQ ....................................... 654

NonDPolynomialChaos
Nonintrusive polynomial chaos expansion approaches to uncertainty quantification .... 657

NonDQuadrature
Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas ................................. 664

NonDQUESOBayesCalibration
Bayesian inference using the QUESO library from UT Austin .................................. 668

NonDReliability
Base class for the reliability methods within DAKOTA/UQ .................................... 674

NonDRKDDarts
Base class for the Recursive k-d Dart methods within DAKOTA/UQ ....................... 676

NonDSampling
Base class for common code between NonDLHSSampling, NonDAdaptImpSampling, and other specializations ................................................................. 679

NonDSparseGrid
Derived nondeterministic class that generates N-dimensional Smolyak sparse grids for numerical evaluation of expectation integrals over independent standard random variables .......... 690

NonDStochCollocation
Nonintrusive stochastic collocation approaches to uncertainty quantification ............ 694

NonDWasABIBayesCalibration
WASABI - Weighted Adaptive Surrogate Approximations for Bayesian Inference ....... 697

NonlinearCGOptimizer ................................................................................. 700

NonlinearCGTraits
A version of TraitsBase specialized for NonlinearCG optimizers ............................ 703

NOWPACBlackBoxEvaluator
Derived class for plugging Dakota evaluations into NOWPAC solver ..................... 704

NOWPACOptimizer
Wrapper class for the (S)NOWPAC optimization algorithms from Florian Augustin (MIT) . 705

NOWPACTraits
A version of TraitsBase specialized for NOWPAC optimizers ............................... 706

NPSOLTraits
Wrapper class for the NPSOL optimization library ............................................. 707
<table>
<thead>

<tr>
<td>ParallelConfiguration</td>
<td>Container class for a set of ParallelLevel list iterators that collectively identify a particular multilevel parallel configuration</td>
<td>720</td>
</tr>
<tr>
<td>ParallelDirectApplicInterface</td>
<td>Sample derived interface class for testing parallel simulator plug-ins using assign_rep()</td>
<td>722</td>
</tr>
<tr>
<td>ParallelLevel</td>
<td>Container class for the data associated with a single level of communicator partitioning</td>
<td>724</td>
</tr>
<tr>
<td>ParallelLibrary</td>
<td>Class for partitioning multiple levels of parallelism and managing message passing within these levels</td>
<td>726</td>
</tr>
<tr>
<td>ParamResponsePair</td>
<td>Container class for a variables object, a response object, and an evaluation id</td>
<td>736</td>
</tr>
<tr>
<td>ParamStudy</td>
<td>Class for vector, list, centered, and multidimensional parameter studies</td>
<td>739</td>
</tr>
<tr>
<td>partial_prp_equality</td>
<td>Predicate for comparing ONLY the interfaceId and Vars attributes of PRPair</td>
<td>745</td>
</tr>
<tr>
<td>partial_prp_hash</td>
<td>Wrapper to delegate to the ParamResponsePair hash_value function</td>
<td>746</td>
</tr>
<tr>
<td>PebbldBranching</td>
<td>Main Branching class for the PEBBL-based Minimizer</td>
<td>746</td>
</tr>
<tr>
<td>PebbldBranchSub</td>
<td>Sub Branch class for the PEBBL-based Minimizer</td>
<td>747</td>
</tr>
<tr>
<td>PebbldTraits</td>
<td>Wrapper class for experimental PebbldMinimizer</td>
<td>748</td>
</tr>

<td>The database containing information parsed from the DAKOTA input file</td>
<td>762</td>
</tr>
<tr>
<td>ProcessApplicInterface</td>
<td>Derived application interface class that spawns a simulation code using a separate process and communicates with it through files</td>
<td>773</td>
</tr>
<tr>
<td>ProcessHandleApplicInterface</td>
<td>Derived application interface class that spawns a simulation code using a separate process, receives a process identifier, and communicates with the spawned process through files</td>
<td>777</td>
</tr>
</tbody>
</table>
10.1. CLASS LIST

ProgramOptions
ProgramOptions stores options whether from the CLH or from library user; initially valid only on worldRank = 0, but then broadcast in ParallelLibrary::push_output_tag() .......................... 781

PStudyDACE
Base class for managing common aspects of parameter studies and design of experiments methods ........................................................................... 786

PSUADEDesignCompExp
Wrapper class for the PSUADE library .................................................................................................................. 788

PythonInterface .................................................................................................................. 791

QMEApproximation
Derived approximation class for QMEA Quadratic Multipoint Exponential Approximation (a multipoint approximation) ........................................... 793

QuesoJointPdf< V, M >
Dakota specialization of QUESO generic joint PDF ........................................................................................... 795

QuesoVectorRV< V, M >
Dakota specialization of QUESO vector-valued random variable ........................................................................... 796

RandomFieldModel
Random field model, capable of generating and then forward propagating ................................................................... 797

RealScale
Data structure for storing real-valued dimension scale ......................................................................................... 802

RecastModel
Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs ........................................................................................... 803

ReducedBasis .................................................................................................................. 814

RelaxedVarConstraints
Derived class within the Constraints hierarchy which employs relaxation of discrete variables .................................. 815

RelaxedVariables
Derived class within the Variables hierarchy which employs the relaxation of discrete variables .................................. 816

Response
Container class for response functions and their derivatives. Response provides the enveloper base class ......................................................... 818

RestartWriter .................................................................................................................. 825

ResultAttribute< T >
Data structure for a single Real, String, or int valued attribute ........................................................................... 825

ResultsDBAny .................................................................................................................. 826

ResultsDBBase .................................................................................................................. 827

ResultsDBHDF5
Manage interactions between ResultsManager and the low-level HDFIOHelper class ........................................ 831

ResultsEntry< StoredType >
Class to manage in-core vs. file database lookups ......................................................................................... 832

ResultsFileError
Exception throw for other results file read error .............................................................................................. 833

ResultsManager
Results manager for iterator final data .............................................................................................. 834

ResultsNames
List of valid names for iterator results .............................................................................................. 836

RichExtrapVerification
Class for Richardson extrapolation for code and solution verification ...................................................................... 837

ROLOptimizer .................................................................................................................. 840
CHAPTER 10. CLASS INDEX

ROLTraits ................................................................. 842
ScalingModel
   Scaling specialization of RecastModel ........................... 843
ScalingOptions
   Simple container for user-provided scaling data, possibly expanded by replicates through the models ......................................................... 849
ScilabInterface ......................................................... 850
SensAnalysisGlobal
   Class for a utility class containing correlation calculations and variance-based decomposition .............................................. 851
SeqHybridMetaIterator
   Method for sequential hybrid iteration using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity .............................................. 854
SerialDirectApplicInterface
   Sample derived interface class for testing serial simulator plug-ins using assign_rep() ......................................................... 858
TrackerHTTP::Server
   Struct to hold tracker/proxy pairs ........................................... 859
SharedApproxData
   Base class for the shared approximation data class hierarchy ......................................................................................... 859
SharedPecosApproxData
   Derived approximation class for global basis polynomials ......................................................................................... 865
SharedResponseData
   Container class encapsulating variables data that can be shared among a set of Response instances ................................................................. 868
SharedResponseDataRep
   The representation of a SharedResponseData instance. This representation, or body, may be shared by multiple SharedResponseData handle instances ......................................................... 871
SharedSurfpackApproxData
   Derived approximation class for Surfpack approximation classes. Interface between Surfpack and Dakota ......................................................................................... 873
SharedVariablesData
   Container class encapsulating variables data that can be shared among a set of Variables instances ................................................................. 874
SharedVariablesDataRep
   The representation of a SharedVariablesData instance. This representation, or body, may be shared by multiple SharedVariablesData handle instances ......................................................... 880
SimulationModel
   Derived model class which utilizes a simulation-based application interface to map variables into responses ................................................................. 885
SimulationResponse
   Container class for response functions and their derivatives. SimulationResponse provides the body class ......................................................................................... 888
SNLLBase
   Base class for OPT++ optimization and least squares methods ......................................................................................... 889
SNLLLeastSqTraits
   Wrapper class for the OPT++ optimization library ......................................................................................... 891
SNLLTraits
   Wrapper class for the OPT++ optimization library ......................................................................................... 892
SOLBase
   Base class for Stanford SOL software ......................................................................................... 893

Chapter 11

File Index

11.1 File List

Here is a list of all documented files with brief descriptions:

- **dakota_dll_api.cpp**
  - This file contains a DakotaRunner class, which launches DAKOTA .
  - Page: 967

- **dakota_dll_api.h**
  - API for DLL interactions
  - Page: 968

- **dakota_linear_algebra.hpp**
  - Dakota linear algebra utilities
  - Page: 969

- **dakota_tabular_io.hpp**
  - Utility functions for reading and writing tabular data files Emerging utilities for tabular file I/O. For now, just extraction of capability from separate contexts to facilitate rework. These augment (and leverage) those in data_util.h
  - Page: 970

- **dll_tester.cpp**
  - Test the DLL with a DAKOTA input file
  - Page: 972

- **JEGAOptimizer.cpp**
  - Contains the implementation of the JEGAOptimizer class
  - Page: 972

- **JEGAOptimizer.hpp**
  - Contains the definition of the JEGAOptimizer class
  - Page: 973

- **library_mode.cpp**
  - File containing a mock simulator main for testing Dakota in library mode
  - Page: 974

- **library_split.cpp**
  - File containing a mock simulator main for testing DAKOTA in library mode on a split communicator
  - Page: 977

- **main.cpp**
  - File containing the main program for DAKOTA
  - Page: 978

- **QUESOImpl.hpp**
  - Page: 978

- **restart_util.cpp**
  - File containing the DAKOTA restart utility main program
  - Page: 979
Chapter 12

Namespace Documentation

12.1 Dakota Namespace Reference

The primary namespace for DAKOTA.

Classes

- class ActiveSubspaceModel
  
  Active subspace model for input (variable space) reduction.

- class AdaptedBasisModel
  
  Adapted basis model for input (variable space) reduction.

- class ApplicationInterface
  
  Derived class within the interface class hierarchy for supporting interfaces to simulation codes.

- class ApproximationInterface
  
  Derived class within the interface class hierarchy for supporting approximations to simulation-based results.

- class APPSEvalMgr
  
  Evaluation manager class for APPSPACK.

- class AppsTraits
  
  Wrapper class for HOPSPACK.

- class BootstrapSamplerBase
  
  Base class/interface for the bootstrap sampler.

- class BootstrapSampler
  
  Actual bootstrap sampler implementation for common data types.

- class BootstrapSampler< Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> >
  
  Bootstrap sampler that is specialized to allow for the bootstrapping of RealMatrix.

- class BootstrapSamplerWithGS
  
  A derived sampler to allow for user specification of the accessor methods.

- class COLINApplication

- class COLINTraits
  
  Wrapper class for optimizers defined using COLIN.

- class CollabHybridMetaIterator
  
  Meta-iterator for hybrid iteration using multiple collaborating optimization and nonlinear least squares methods.
• class GetLongOpt
  
  *GetLongOpt* is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France).

• class CommandLineHandler
  
  Utility class for managing command line inputs to DAKOTA.

• class CommandShell
  
  Utility class which defines convenience operators for spawning processes with system calls.

• class ConcurrentMetaIterator
  
  Meta-iterator for multi-start iteration or pareto set optimization.

• class CONMINTraits
  
  Wrapper class for the CONMIN optimization library.

• class FileReadException
  
  base class for Dakota file read exceptions (to allow catching both tabular and general file truncation issues)

• class TabularDataTruncated
  
  exception thrown when data read truncated

• class ResultsFileError
  
  exception throw for other results file read error

• class FunctionEvalFailure
  
  exception class for function evaluation failures

• struct BaseConstructor
  
  Dummy struct for overloading letter-envelope constructors.

• struct NoDBBaseConstructor
  
  Dummy struct for overloading constructors used in on-the-fly instantiations without ProblemDescDB support.

• struct LightWtBaseConstructor
  
  Dummy struct for overloading constructors used in on-the-fly Model instantiations.

• struct RealScale
  
  Data structure for storing real-valued dimension scale.

• struct StringScale
  
  Data structure for storing string-valued dimension scale.

• struct ResultAttribute
  
  Data structure for a single Real, String, or int valued attribute.

• class ActiveSet
  
  Container class for active set tracking information. Contains the active set request vector and the derivative variables vector.

• class Analyzer
  
  Base class for NonD, DACE, and ParamStudy branches of the iterator hierarchy.

• class Approximation
  
  Base class for the approximation class hierarchy.

• class Constraints
  
  Base class for the variable constraints class hierarchy.

• class Environment
  
  Base class for the environment class hierarchy.
12.1. DAKOTA NAMESPACE REFERENCE

The Graphics class provides a single interface to 2D (motif) and 3D (PLPLOT) graphics; there is only one instance of this OutputManager::dakotaGraphics.

- class Interface
  Base class for the interface class hierarchy.
- class Iterator
  Base class for the iterator class hierarchy.
- class LeastSq
  Base class for the nonlinear least squares branch of the iterator hierarchy.
- class Minimizer
  Base class for the optimizer and least squares branches of the iterator hierarchy.
- class ScalingOptions
  Simple container for user-provided scaling data, possibly expanded by replicates through the models.
- class Model
  Base class for the model class hierarchy.
- class NonD
  Base class for all nondeterministic iterators (the DAKOTA/UQ branch).
- class Optimizer
  Base class for the optimizer branch of the iterator hierarchy.
- class PStudyDACE
  Base class for managing common aspects of parameter studies and design of experiments methods.
- class Response
  Container class for response functions and their derivatives. Response provides the enveloper base class.
- class TraitsBase
  Base class for traits.
- class GeneralReader
  Utility used in derived read_core to read in generic format.
- class TabularReader
  Utility used in derived read_core to read values in tabular format.
- class GeneralWriter
  Utility used in derived write_core to write in generic format.
- class ApreproWriter
  Utility used in derived write_core to write in aprepro format.
- class TabularWriter
  Utility used in derived write_core to write values in tabular format.
- class LabelsWriter
  Utility used in derived write_core to write labels in tabular format.
- class Variables
  Base class for the variables class hierarchy.
- class Verification
  Base class for managing common aspects of verification studies.
- class DataEnvironmentRep
  Body class for environment specification data.
- class DataEnvironment
Handle class for environment specification data.

- class **DataFitSurrBasedLocalTraits**
  
  Class for provably-convergent local surrogate-based optimization and nonlinear least squares.

- class **DataFitSurrModel**
  
  Derived model class within the surrogate model branch for managing data fit surrogates (global and local)

- class **DataInterface**
  
  Handle class for interface specification data.

- class **DataMethodRep**
  
  Body class for method specification data.

- class **DataMethod**
  
  Handle class for method specification data.

- class **DataModelRep**
  
  Body class for model specification data.

- class **DataModel**
  
  Handle class for model specification data.

- class **DataResponsesRep**
  
  Body class for responses specification data.

- class **DataResponses**
  
  Handle class for responses specification data.

- class **DataTransformModel**
  
  Data transformation specialization of RecastModel.

- class **DataVariablesRep**
  
  Body class for variables specification data.

- class **DataVariables**
  
  Handle class for variables specification data.

- class **DDACEDesignCompExp**
  
  Wrapper class for the DDACE design of experiments library.

- class **DirectApplicInterface**
  
  Derived application interface class which spawns simulation codes and testers using direct procedure calls.

- class **DiscrepancyCorrection**
  
  Base class for discrepancy corrections.

- class **DLSolverTraits**
  
  A version of TraitsBase specialized for DLSolver.

- class **DOTTraits**
  
  Wrapper class for the DOT optimization library.

- class **EffGlobalTraits**
  
  Implementation of Efficient Global Optimization/Least Squares algorithms.

- class **EffGlobalMinimizer**

- class **EmbedHybridMetaIterator**
  
  Meta-iterator for closely-coupled hybrid iteration, typically involving the embedding of local search methods within global search methods.

- class **ExecutableEnvironment**
  
  Environment corresponding to execution as a stand-alone application.
• class **ExperimentData**
  Interpolation method for interpolating between experimental and model data. I need to work on inputs/outputs to this method. For now, this assumes interpolation of functional data.

• class **ExperimentResponse**
  Container class for response functions and their derivatives. **ExperimentResponse** provides the body class.

• class **ForkApplicInterface**
  Derived application interface class which spawns simulation codes using fork/execvp/waitpid.

• class **FSUDesignCompExp**
  Wrapper class for the FSUDace QMC/CVT library.

• class **GaussProcApproximation**
  Derived approximation class for Gaussian Process implementation.

• class **GridApplicInterface**
  Derived application interface class which spawns simulation codes using grid services such as Condor or Globus.

• class **HDF5IOHelper**

• class **HierarchSurrBasedLocalTraits**
  Class for multilevel-multifidelity optimization algorithm.

• class **HierarchSurrModel**
  Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity).

• class **IteratorScheduler**
  This class encapsulates scheduling operations for concurrent sub-iteration within an outer level context (e.g., meta-iteration, nested models).

• class **JEGAOptimizer**
  A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

• class **JEGATraits**
  A version of TraitsBase specialized for John Eddy’s Genetic Algorithms (JEGA).

• class **LibraryEnvironment**
  Environment corresponding to execution as an embedded library.

• class **MatlabInterface**

• class **MetaIterator**
  Base class for meta-iterators.

• class **MixedVarConstraints**
  Derived class within the Constraints hierarchy which separates continuous and discrete variables (no domain type array merging).

• class **MixedVariables**
  Derived class within the Variables hierarchy which separates continuous and discrete variables (no domain type array merging).

• class **MPIManager**
  Class MPIManager to manage Dakota’s MPI world, which may be a subset of MPI_COMM_WORLD.

• class **MPIPackBuffer**
  Class for packing MPI message buffers.

• class **MPIUnpackBuffer**
  Class for unpacking MPI message buffers.

• class **NCSUTraits**
Wrapper class for the NCSU DIRECT optimization library.

- class NestedModel
  Derived model class which performs a complete sub-iterator execution within every evaluation of the model.
- struct Var_rcheck
  structure for verifying bounds and initial point for real-valued vars
- struct Var_iCheck
  structure for verifying bounds and initial point for string-valued vars
- struct VLreal
  structure for validating real uncertain variable labels, bounds, values
- struct VLInt
  structure for validating integer uncertain variable labels, bounds, values
- struct VLstr
  structure for validating string uncertain variable labels, bounds, values
- class NIDRProblemDescDB
  The derived input file database utilizing the new IDR parser.
- struct NL2Res
  Auxiliary information passed to calcr and calcj via ur.
- class NL2SOLLastSqTraits
  Wrapper class for the NL2SOL nonlinear least squares library.
- class NLPQLP Traits
  Wrapper class for the NLPQLP optimization library, Version 2.0.
- class NLSSOLLastSqTraits
  Wrapper class for the NLSSOL nonlinear least squares library.
- class NomadTraits
  Wrapper class for NOMAD Optimizer.
- class NonDAdaptImpSampling
  Class for the Adaptive Importance Sampling methods within DAKOTA.
- class NonDAdaptiveSampling
  Class for testing various Adaptively sampling methods using geometric, statistical, and topological information of the surrogate.
- class NonDBayesCalibration
  Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data.
- class NonDCalibration
- class NonDCubature
  Derived nondeterministic class that generates N-dimensional numerical cubature points for evaluation of expectation integrals.
- class NonDDREAMBayesCalibration
  Bayesian inference using the DREAM approach.
- class NonDExpansion
  Base class for polynomial chaos expansions (PCE) and stochastic collocation (SC)
- class NonDGlobalEvidence
  Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.
- class NonDGlobalInterval
12.1. DAKOTA NAMESPACE REFERENCE

Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- **class NonDGlobalReliability**
  Class for global reliability methods within DAKOTA/UQ.

- **class NonDGlobalSingleInterval**
  Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- **class NonDGPImpSampling**
  Class for the Gaussian Process-based Importance Sampling method.

- **class NonDGPMSABayesCalibration**
  Generates posterior distribution on model parameters given experiment data.

- **class NonDIntegration**
  Derived nondeterministic class that generates N-dimensional numerical integration points for evaluation of expectation integrals.

- **class NonDInterval**
  Base class for interval-based methods within DAKOTA/UQ.

- **class NonDLHSEvidence**
  Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

- **class NonDLHSInterval**
  Class for the LHS-based interval methods within DAKOTA/UQ.

- **class NonDLHSSampling**
  Performs LHS and Monte Carlo sampling for uncertainty quantification.

- **class NonDLHSSingleInterval**
  Class for pure interval propagation using LHS.

- **class NonDLocalEvidence**
  Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

- **class NonDLocalInterval**
  Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- **class NonDLocalReliability**
  Class for the reliability methods within DAKOTA/UQ.

- **class NonDLocalSingleInterval**
  Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

- **class NonDMultilevelPolynomialChaos**
  Nonintrusive polynomial chaos expansion approaches to uncertainty quantification.

- **class NonDMultilevelSampling**
  Performs Multilevel Monte Carlo sampling for uncertainty quantification.

- **class NonDMultilevelStochCollocation**
  Nonintrusive stochastic collocation approaches to uncertainty quantification.

- **class NonDPOFDarts**
  Base class for POF Dart methods within DAKOTA/UQ.

- **class NonDPolynomialChaos**
  Nonintrusive polynomial chaos expansion approaches to uncertainty quantification.
• class **NonDQuadrature**
  Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas.

• class **DerivInformedPropCovTK**
  *Dakota* transition kernel that updates proposal covariance based on derivatives (for random walk case)

• class **DerivInformedPropCovLogitTK**
  *Dakota* transition kernel that updates proposal covariance based on derivatives (for logit random walk case)

• class **NonDQUESOBayesCalibration**
  Bayesian inference using the QUESO library from UT Austin.

• class **NonDReliability**
  Base class for the reliability methods within DAKOTA/UQ.

• class **NonDRKDDarts**
  Base class for the Recursive k-d Dart methods within DAKOTA/UQ.

• class **NonDSampling**
  Base class for common code between NonDLHSSampling, NonDAdaptImpSampling, and other specializations.

• class **NonDSparseGrid**
  Derived nondeterministic class that generates N-dimensional Smolyak sparse grids for numerical evaluation of expectation integrals over independent standard random variables.

• class **NonDStochCollocation**
  Nonintrusive stochastic collocation approaches to uncertainty quantification.

• class **NonDWASABIBayesCalibration**
  WASABI - Weighted Adaptive Surrogate Approximations for Bayesian Inference.

• class **NonlinearCGTraits**
  A version of TraitsBase specialized for NonlinearCG optimizers.

• class **NonlinearCGOptimizer**

• class **NOWPACBlackBoxEvaluator**
  Derived class for plugging Dakota evaluations into NOWPAC solver.

• class **NOWPACTraits**
  A version of TraitsBase specialized for NOWPAC optimizers.

• class **NOWPACOptimizer**
  Wrapper class for the (S)NOWPAC optimization algorithms from Florian Augustin (MIT)

• class **NPSOLTraits**
  Wrapper class for the NPSOL optimization library.

• class **OptDartsTraits**
  A version of TraitsBase specialized for OptDarts.

• class **OptDartsOptimizer**
  Wrapper class for OptDarts Optimizer.

• class **OutputWriter**

• class **ConsoleRedirector**

• class **RestartWriter**

• class **OutputManager**
  Class to manage redirection of stdout/stderr, keep track of current redir state, and manage rank 0 output. Also manage tabular data output for post-processing with Matlab, Tecplot, etc. and delegate to Graphics for X Windows Graphics.
12.1. DAKOTA NAMESPACE REFERENCE

- **class ParallelLevel**
  Container class for the data associated with a single level of communicator partitioning.

- **class ParallelConfiguration**
  Container class for a set of ParallelLevel list iterators that collectively identify a particular multilevel parallel configuration.

- **class ParallelLibrary**
  Class for partitioning multiple levels of parallelism and managing message passing within these levels.

- **class ParamResponsePair**
  Container class for a variables object, a response object, and an evaluation id.

- **class ParamStudy**
  Class for vector, list, centered, and multidimensional parameter studies.

- **class PebbldBranching**
  Main Branching class for the PEBBL-based Minimizer.

- **class PebbldBranchSub**
  Sub Branch class for the PEBBL-based Minimizer.

- **class PebbldTraits**
  Wrapper class for experimental PebbldMinimizer.

- **class PecosApproximation**
  Derived approximation class for global basis polynomials.

- **class ProbabilityTransformModel**
  Probability transformation specialization of RecastModel.

- **class ProblemDescDB**
  The database containing information parsed from the DAKOTA input file.

- **class ProcessApplicInterface**
  Derived application interface class that spawns a simulation code using a separate process and communicates with it through files.

- **class ProcessHandleApplicInterface**
  Derived application interface class that spawns a simulation code using a separate process, receives a process identifier, and communicates with the spawned process through files.

- **class ProgramOptions**
  ProgramOptions stores options whether from the CLH or from library user; initially valid only on worldRank = 0, but then broadcast in ParallelLibrary::push_output_tag()

- **struct partial_prp_hash**
  wrapper to delegate to the ParamResponsePair hash_value function

- **struct partial_prp_equality**
  predicate for comparing ONLY the interfaceId and Vars attributes of PRPair

- **class PSUADEDesignCompExp**
  Wrapper class for the PSUADE library.

- **class PythonInterface**

- **class QMEApproximation**
  Derived approximation class for QMEA Quadratic Multipoint Exponential Approximation (a multipoint approximation).

- **class QuesoJointPdf**
  Dakota specialization of QUESO generic joint PDF.
• class QuesoVectorRV
  *Dakota* specialization of QUESO vector-valued random variable.

• class TKFactoryDIPC
  Custom RW TKfactory: passes *Dakota* QUESO instance pointer to the TK at build.

• class TKFactoryDIPCLogit
  Custom Logit RW TKfactory: passed *Dakota* QUESO instance pointer to the TK at build.

• class RandomFieldModel
  Random field model, capable of generating and then forward propagating.

• class RecastModel
  Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs.

• class ReducedBasis
• class RelaxedVarConstraints
  Derived class within the Constraints hierarchy which employs relaxation of discrete variables.

• class RelaxedVariables
  Derived class within the Variables hierarchy which employs the relaxation of discrete variables.

• class ResultsDBAny
• class ResultsDBBase
• class AddAttributeVisitor
  Objects of this class are called by boost::appy_visitor to add attributes to HDF5 objects.

• class AttachScaleVisitor
  Objects of this class are called by boost::appy_visitor to add dimension scales (RealScale or StringScale) to HDF5 datasets.

• class ResultsDBHDF5
  Manage interactions between ResultsManager and the low-level HDFIOManager class.

• class ResultsNames
  List of valid names for iterator results.

• class ResultsManager
  Results manager for iterator final data.

• class ResultsEntry
  Class to manage in-core vs. file database lookups.

• class RichExtrapVerification
  Class for Richardson extrapolation for code and solution verification.

• class RLOptimizer
• class ROLTraits
• class DakotaROLObjective
• class DakotaROLObjectiveGrad
• class DakotaROLObjectiveHess
• class DakotaROLIneqConstraints
• class DakotaROLIneqConstraintsGrad
• class DakotaROLIneqConstraintsHess
• class DakotaROLEqConstraints
• class DakotaROLEqConstraintsGrad
• class DakotaROLEqConstraintsHess
12.1. DAKOTA NAMESPACE REFERENCE

- class **PrefixingLineFilter**
- class **ScalingModel**
  
  Scaling specialization of **RecastModel**.
- class **ScilabInterface**
- class **SensAnalysisGlobal**
  
  Class for a utility class containing correlation calculations and variance-based decomposition.
- class **SeqHybridMetaIterator**
  
  Method for sequential hybrid iteration using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity.
- class **SharedApproxData**
  
  Base class for the shared approximation data class hierarchy.
- class **SharedPecosApproxData**
  
  Derived approximation class for global basis polynomials.
- class **SharedResponseDataRep**
  
  The representation of a **SharedResponseData** instance. This representation, or body, may be shared by multiple **SharedResponseData** handle instances.
- class **SharedResponseData**
  
  Container class encapsulating variables data that can be shared among a set of **Response** instances.
- class **SharedSurfpackApproxData**
  
  Derived approximation class for Surfpack approximation classes. **Interface** between Surfpack and Dakota.
- class **SharedVariablesDataRep**
  
  The representation of a **SharedVariablesData** instance. This representation, or body, may be shared by multiple **SharedVariablesData** handle instances.
- class **SharedVariablesData**
  
  Container class encapsulating variables data that can be shared among a set of **Variables** instances.
- class **SimulationModel**
  
  Derived model class which utilizes a simulation-based application interface to map variables into responses.
- class **SimulationResponse**
  
  Container class for response functions and their derivatives. **SimulationResponse** provides the body class.
- class **SNLLBase**
  
  Base class for OPT++ optimization and least squares methods.
- class **SNNLLLeastSqTraits**
  
  Wrapper class for the OPT++ optimization library.
- class **SNNLLTraits**
  
  Wrapper class for the OPT++ optimization library.
- class **SOLBase**
  
  Base class for Stanford SOL software.
- class **SpawnApplicInterface**
  
  Derived application interface class which spawns simulation codes using spawnmp.
- class **SurfpackApproximation**
  
  Derived approximation class for Surfpack approximation classes. **Interface** between Surfpack and Dakota.
- class **SurrBasedGlobalTraits**
  
  The global surrogate-based minimizer which sequentially minimizes and updates a global surrogate model without trust region controls.
CHAPTER 12. NAMESPACE DOCUMENTATION

- **class** `SurrBasedGlobalMinimizer`
- **class** `SurrBasedLocalMinimizer`
  
  Class for provably-convergent local surrogate-based optimization and nonlinear least squares.
- **class** `SurrBasedMinimizer`
  
  Base class for local/global surrogate-based optimization/least squares.
- **class** `SurrogateModel`
  
  Base class for surrogate models (`DataFitSurrModel` and `HierarchSurrModel`).
- **class** `SysCallApplicInterface`
  
  Derived application interface class which spawns simulation codes using system calls.
- **class** `TANA3Approximation`
  
  Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation).
- **class** `TaylorApproximation`
  
  Derived approximation class for first- or second-order Taylor series (a local approximation).
- **class** `TestDriverInterface`
- **class** `TrackerHTTP`
  
  *TrackerHTTP*: a usage tracking module that uses HTTP/HTTPS via the curl library.
- **class** `UsageTracker`
  
  Lightweight class to manage conditionally active Curl-based HTTP tracker via PIMPL.
- **class** `VPSApproximation`
  
  Derived approximation class for VPS implementation.
- **class** `WeightingModel`
  
  Weighting specialization of `RecastModel`.
- **struct** `MatchesWC`
  
  Predicate that returns true when the passed path matches the wildcard with which it was configured. Currently supports * and ?.
- **class** `WorkdirHelper`

**Typedefs**

- typedef double **Real**

partial_prp_equality >> > > PRPMultiIndexQueue

Boost Multi-Index Container for locally queueing ParamResponsePairs.

• typedef PRPMultiIndexQueue PRPQueue
• typedef
PRPQueue::index_iterator
< ordered >::type PRPQueueOIter
• typedef
PRPQueue::index_const_iterator
< ordered >::type PRPQueueOCIIter
• typedef
PRPQueue::index_iterator
< hashed >::type PRPQueueHIter
• typedef
PRPQueue::index_const_iterator
< hashed >::type PRPQueueHCIter
• typedef PRPQueueOIter PRPQueueIter
• typedef PRPQueueOCIter PRPQueueCIter
• typedef std::pair< boost::any,
MetaDataType > ResultsValueType

Core data storage type: boost::any, with optional metadata (see other types in results_types.hpp)

• typedef boost::function< bool(const
bfs::path &src_path, const
bfs::path &dest_path, bool
overwrite)> file_op_function

define a function type that operates from src to dest, with option to overwrite

• typedef boost::filter_iterator
< MatchesWC,
bfs::directory_iterator > glob_iterator

a glob_iterator filters a directory_iterator based on a wildcard predicate

Enumerations

• enum {
  COBYLA, DIRECT, EA, MS,
  PS, SW, BETA }

12.1. DAKOTA NAMESPACE REFERENCE

- enum {
  APPROX_ERROR = -8, METHOD_ERROR = -7, MODEL_ERROR = -6, IO_ERROR = -5,
  INTERFACE_ERROR = -4, CONSTRUCT_ERROR = -3, PARSE_ERROR = -2, OTHER_ERROR
  = -1
}

  "enum for Dakota abort reasons; using negative numbers to distinguish Dakota exit states from signals / uncaught
  signals. These need to be in range [-63, -1], so exit code (256+enum) is in [193, 255]. See RATIONALE in
  dakota_global_defs.cpp."

  CONVERGED }

- enum {
  TH_SILENT_OUTPUT, TH_QUIET_OUTPUT, TH_NORMAL_OUTPUT, TH_VERBOSE_OUTPUT, TH_DEBUG_OUTPUT }

- enum { DIR_CLEAN, DIR_PERSIST, DIR_ERROR }

  define directory creation options

- enum { FILEOP_SILENT, FILEOP_WARN, FILEOP_ERROR }

  enum indicating action on failed file operation

Functions

- void batch_means_interval (RealMatrix &mcmc_matrix, RealMatrix &interval_matrix, RealMatrix &means_matrix, int moment, Real alpha)

  CommandShell & flush (CommandShell &shell)

    convenient shell manipulator function to "flush" the shell

- void read_sized_data (std::istream &s, RealVectorArray &va, size_t num_experiments, int num_state_variables)
CHAPTER 12. NAMESPACE DOCUMENTATION

- **istream extraction operator for configuration data of known dim and length**
  - `void read_fixed_rowsize_data (std::istream &s, RealVectorArray &va, int num_responses, bool row_major=true)`
  - istream extraction operator for response data of unknown dim and unknown length
  - `void read_config_vars_multifile (const std::string &basename, int num_expts, int ncv, RealVectorArray &config_vars)`
    - file reader for configuration data supplied via multiple files
  - `void read_config_vars_singlefile (const std::string &basename, int num_expts, int ncv, RealVectorArray &config_vars)`
    - file reader for configuration data supplied via a single file
- **istream extraction operator for coordinate data of unknown dim and unknown length**
  - `void read_config vars (const std::string &basename, int num_expts, int ncv, RealVectorArray &config_vars)`
  - file reader for experimental coordinate data
  - `void read_coord_values (const std::string &basename, int expt_num, RealMatrix &coords)`
    - file reader for simulation coordinate data
  - `void read_c covariance (const std::string &basename, int expt_num, Dakota::CovarianceMatrix::FORMAT, int num_vals, RealMatrix &cov_vals)`
    - file reader for CONSTANT covariance data
  - `void read_co covariance (const std::string &basename, int expt_num, Dakota::CovarianceMatrix::FORMAT, int num_vals, RealMatrix &cov_vals)`
    - file reader for VECTOR and MATRIX covariance data
  - `template<typename T >
    std::string convert_to_string (const T &value)`
    - simple utility to convert intrinsics to strings
  - `template<typename OrdinalType , typename ScalarType >
    void read_data (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v)`
    - standard istream extraction operator for full SerialDenseVector
  - `template<typename OrdinalType , typename ScalarType >
    void read_data (std::istream &s, Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &m)`
    - standard istream extraction operator for SerialSymDenseMatrix
  - `template<typename OrdinalType , typename ScalarType >
    void read_data (std::istream &s, std::vector< Teuchos::SerialDenseVector< OrdinalType, ScalarType > > &va)`
    - standard istream extraction operator for std::vector of SerialDenseVectors
  - `template<typename OrdinalType , typename ScalarType >
    void read_data (std::istream &s, Teuchos::SerialDenseVector< OrdinalType, ScalarType > &v, StringMultiArray &label_array)`
    - standard istream extraction operator for full SerialDenseVector with labels

*tabular ostream insertion operator for view of StringMultiArray*

- template<typename OrdinalType, typename ScalarType>
  void write_data (std::ostream &s, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &m, bool brackets=true, bool row_rtn=true, bool final_rtn=true)

formatted ostream insertion operator for SerialDenseMatrix

- template<typename OrdinalType, typename ScalarType>
  void write_data (std::ostream &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &m, bool brackets=true, bool row_rtn=true, bool final_rtn=true)

formatted ostream insertion operator for SerialSymDenseMatrix

- template<typename OrdinalType, typename ScalarType, typename StringArray, typename StringArray>
  void write_data (std::ostream &s, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &m, const StringArray &row_labels, const StringArray &col_labels)

ostream insertion operator for SerialDenseMatrix with row/col labels

- template<typename OrdinalType, typename ScalarType>
  void write_lower_triangle (std::ostream &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &sm, bool row_rtn=true)

ostream version for writing the lower triangle of a SerialSymDenseMatrix

- template<typename OStreamType, typename OrdinalType, typename ScalarType>
  void write_lower_triangle (OStreamType &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &sm)

generic output stream template for writing the lower triangle of a SerialSymDenseMatrix

- template<typename OrdinalType, typename ScalarType, typename SerialDenseMatrix>
  void write_col_vector_trans (std::ostream &s, OrdinalType col, OrdinalType num_items, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm, bool brackets=true, bool break_line=true, bool final_rtn=true)

ostream insertion operator for a column vector from a SerialDenseMatrix

- template<typename OrdinalType, typename ScalarType, typename SerialDenseMatrix>
  void write_col_vector_trans (std::ostream &s, OrdinalType col, OrdinalType num_items, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm, bool brackets=true, bool break_line=true, bool final_rtn=true)

ostream insertion operator for a column vector from a SerialDenseMatrix

- template<typename OStreamType, typename OrdinalType, typename ScalarType, typename SerialDenseMatrix>
  void write_col_vector_trans (OStreamType &s, OrdinalType col, OrdinalType num_items, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)

ostream insertion operator for a column vector from a SerialDenseMatrix
12.1. DAKOTA NAMESPACE REFERENCE

- template<typename OStreamType, typename OrdinalType, typename ScalarType>
  void write_col_vector_trans (OStreamType &s, OrdinalType col, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)
  "ostream insertion operator for a column vector from a SerialDenseMatrix"

- template<typename ArrayT>
  void array_write (std::ostream &s, const ArrayT &v)
  "write array to std::ostream"

- template<typename ArrayT>
  void array_write (std::ostream &s, const ArrayT &v, const std::vector<String>& label_array)
  "write array to std::ostream with labels"

- void array_write_aprepro (std::ostream &s, const StringArray &v, const std::vector<String>& label_array)
  "write array to std::ostream (APREPRO format) specialize for StringArray: values need quoting"

- template<typename ArrayT>
  void array_write (std::ostream &s, const ArrayT &v, bool write_len)
  "Write array to ostream as a row vector; precede with length if write_len = true."

- template<typename OrdinalType, typename ScalarType>
  void read_data (MPIUnpackBuffer &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArray &label_array)
  "standard MPI buffer extraction operator for full SerialDenseVector with labels"

- template<typename OrdinalType, typename ScalarType>
  void read_data (MPIUnpackBuffer &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &v, StringMultiArrayView label_array)
  "standard MPI buffer extraction operator for full SerialDenseVector with labels"

- void read_data (MPIUnpackBuffer &s, StringMultiArray &v, StringMultiArrayView label_array)
  "standard MPI buffer extraction operator for StringMultiArray with labels"

- template<typename U, typename V>
  MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, std::pair<U, V> &data)
  "global MPIUnpackBuffer extraction operator for std::pair"

- template<typename U, typename V>
  MPIPackBuffer & operator< (MPIPackBuffer &s, const std::pair<U, V> &data)
  "global MPIPackBuffer insertion operator for std::pair"

- template<typename T>
  MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, std::set<T> &data)
  "global MPIUnpackBuffer extraction operator for std::set"

- template<typename T>
  MPIPackBuffer & operator< (MPIPackBuffer &s, const std::set<T> &data)
global MPIPackBuffer insertion operator for std::set

- template<typename KeyT, typename ValueT>
  MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, std::map<KeyT, ValueT> &data)

global MPIUnpackBuffer extraction operator for std::map

- template<typename KeyT, typename ValueT>
  MPIPackBuffer & operator<<(MPIPackBuffer &s, const std::map<KeyT, ValueT> &data)

global MPIPackBuffer insertion operator for std::map

- template<typename OrdinalType, typename ScalarType>
  MPIPackBuffer & operator<<(MPIPackBuffer &s, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)

- template<typename OrdinalType, typename ScalarType>
  MPIPackBuffer & operator<<(MPIPackBuffer &s, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &data)

- template<typename OrdinalType, typename ScalarType>
  MPIPackBuffer & operator<<(MPIPackBuffer &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &data)

- template<typename T>
  std::istream & operator>>(std::istream &s, std::vector<T> &data)

global std::istream extraction operator for std::vector

- template<typename T>
  std::ostream & operator<<(std::ostream &s, const std::vector<T> &data)

global std::ostream insertion operator for std::vector

- template<typename T>
  std::ostream & operator<<(std::ostream &s, const std::list<T> &data)

global std::ostream insertion operator for std::list

- template<typename U, typename V>
  std::ostream & operator<<(std::ostream &s, const std::pair<U, V> &data)

global ostream insertion operator for std::pair

- template<typename T>
  std::ostream & operator<<(std::ostream &s, const std::set<T> &data)

global std::ostream insertion operator for std::set
12.1. DAKOTA NAMESPACE REFERENCE

- template<typename KeyT, typename ValueT>
  std::ostream & operator<<(std::ostream &s, const std::map<KeyT, ValueT> &data)
  
  global std::ostream insertion operator for std::map

- template<typename OrdinalType, typename ScalarType>
  std::istream & operator>>(std::istream &s, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)
  
  global std::istream extraction operator for SerialDenseVector

- template<typename OrdinalType, typename ScalarType>
  std::ostream & operator<<(std::ostream &s, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &data)
  
  global std::ostream insertion operator for SerialDenseVector

- template<typename OrdinalType, typename ScalarType>
  std::istream & operator>>(std::istream &s, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &data)
  
  global std::istream extraction operator for SerialDenseMatrix

- template<typename OrdinalType, typename ScalarType>
  std::ostream & operator<<(std::ostream &s, const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &data)
  
  global std::ostream insertion operator for SerialDenseMatrix

- template<typename OrdinalType, typename ScalarType>
  std::ostream & operator<<(std::ostream &s, const Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &data)
  
  global std::ostream insertion operator for SerialSymDenseMatrix

- bool nearby (const RealVector &rv1, const RealVector &rv2, Real rel_tol)
  
  tolerance-based equality operator for RealVector

- bool operator==(const ShortArray &dsa1, const ShortArray &dsa2)
  
  equality operator for ShortArray

- bool operator==(const StringArray &dsa1, const StringArray &dsa2)
  
  equality operator for StringArray

- Real rel_change_L2 (const RealVector &curr_rv, const RealVector &prev_rv)
  
  Computes relative change between RealVectors using Euclidean L2 norm.

- Real rel_change_L2 (const RealVector &curr_rv1, const RealVector &prev_rv1, const IntVector &curr_iv, const IntVector &prev_iv, const RealVector &curr_rv2, const RealVector &prev_rv2)
  
  Computes relative change between Real/int/Real vector triples using Euclidean L2 norm.

- void compute_col_means (RealMatrix &matrix, RealVector &avg_vals)
  
  Computes means of columns of matrix.

- void compute_col_stdevs (RealMatrix &matrix, RealVector &avg_vals, RealVector &std_devs)
  
  Computes standard deviations of columns of matrix.

- void remove_column (RealMatrix &matrix, int index)
  
  Removes column from matrix.

- void iround (const RealVector &input_vec, IntVector &rounded_vec)
round entries of a RealVector yielding an IntVector

- bool operator==(const IntArray &dia1, const IntArray &dia2)
  
  equality operator for IntArray

- template<typename T>
  bool operator==(const std::vector<T> &vec, typename boost::multi_array<T, 1>::template const_array_view<1>::type mav)
  
  equality operator for std::vector and boost::multi_array::const_array_view

- template<typename T>
  bool operator==(typename boost::multi_array<T, 1>::template const_array_view<1>::type mav, const std::vector<T> &vec)
  
  equality operator for boost::multi_array::const_array_view and std::vector

- template<typename T>
  bool operator==(const boost::multi_array<T, 1>& ma, typename boost::multi_array<T, 1>::template const_array_view<1>::type mav)
  
  equality operator for boost::multi_array and boost::multi_array::const_array_view

- template<typename T>
  bool operator==(typename boost::multi_array<T, 1>::template const_array_view<1>::type mav, const boost::multi_array<T, 1>& ma)
  
  equality operator for boost::multi_array::const_array_view and boost::multi_array

- bool operator!=(const IntArray &dia1, const IntArray &dia2)
  
  inequality operator for IntArray

- bool operator!=(const ShortArray &dsa1, const ShortArray &dsa2)
  
  inequality operator for ShortArray

- bool operator!=(const StringArray &dsa1, const StringArray &dsa2)
  
  inequality operator for StringArray

- template<typename T>
  bool operator!=(const std::vector<T> &vec, typename boost::multi_array<T, 1>::template const_array_view<1>::type mav)
  
  inequality operator for std::vector and boost::multi_array::const_array_view

- template<typename T>
  bool operator!=(typename boost::multi_array<T, 1>::template const_array_view<1>::type mav, const std::vector<T> &vec)
  
  inequality operator for boost::multi_array::const_array_view and std::vector

- template<typename T>
  bool operator!=(const boost::multi_array<T, 1>& ma, typename boost::multi_array<T, 1>::template const_array_view<1>::type mav)
  
  inequality operator for boost::multi_array and boost::multi_array::const_array_view

- template<typename T>
  bool operator!=(typename boost::multi_array<T, 1>::template const_array_view<1>::type mav, const boost::multi_array<T, 1>& ma)
  
  inequality operator for boost::multi_array::const_array_view and boost::multi_array

- template<typename OrdinalType>
  bool non_zero(const std::vector<OrdinalType> &vec)
  
  checks for any non-zero value in std::vector(); useful for determining whether an array of request codes (e.g., an ASV) has any actionable content
12.1. DAKOTA NAMESPACE REFERENCE

- template<typename VectorType>
  bool is_equal_vec (const RealVector &vec1, const VectorType &vec2)
  
  equality function for RealVector and a vector of arbitrary type

- template<typename MatrixType, typename VectorType>
  void apply_matrix_partial (const MatrixType &M, const VectorType &v1, VectorType &v2)
  
  Applies a RealMatrix to a vector (or subset of vector) v1.

- template<typename VectorType>
  void apply_matrix_transpose_partial (const RealMatrix &M, const VectorType &v1, VectorType &v2)
  
  Applies transpose of a RealMatrix to a vector (or subset of vector) v1.

- std::string strtolower (const std::string &s)
  
  Return lowercase copy of string s.

- bool strbegins (const std::string &input, const std::string &test)
  
  Return true if input string begins with string test.

- bool strends (const std::string &input, const std::string &test)
  
  Return true if input string ends with string test.

- bool strcontains (const std::string &input, const std::string &test)
  
  Return true if input string contains string test.

- void build_label (String &label, const String &root_label, size_t tag, const String &separator="")
  
  create a label by appending a numerical tag to the root_label, o

- void build_labels (StringArray &label_array, const String &root_label)
  
  create an array of labels by tagging root_label for each entry in label_array. Uses build_label().

- void build_labels (StringMultiArray &label_array, const String &root_label)
  
  create an array of labels by tagging root_label for each entry in label_array. Uses build_label().

- void build_labels_partial (StringArray &label_array, const String &root_label, size_t start_index, size_t num_items)
  
  create a partial array of labels by tagging root_label for a subset of entries in label_array. Uses build_label().

- template<typename OrdinalType, typename ScalarType>
  void copy_data (const std::vector<Teuchos::SerialDenseVector<OrdinalType, ScalarType>> &sdva, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)
  
  copy Array<Teuchos::SerialDenseVector<OT,ST> > to Teuchos::SerialDenseMatrix<OT,ST> - used by read_data_tabular - RWH

- template<typename OrdinalType, typename ScalarType>
  void copy_data_transpose (const std::vector<Teuchos::SerialDenseVector<OrdinalType, ScalarType>> &sdva, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm)
  
  copy Array<Teuchos::SerialDenseVector<OT,ST> > to transposed Teuchos::SerialDenseMatrix<OT,ST> - used by read_data_tabular - RWH

- template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sv, Teuchos::SerialDenseMatrix<OrdinalType1, ScalarType> &sdm, OrdinalType2 nr, OrdinalType2 nc)
  
  copy Teuchos::SerialDenseVector<OT,ST> to Teuchos::SerialDenseMatrix<OT,ST> - used by NestedModel::update_sub_iterator - RWH

- template<typename T>
  void copy_data (const std::vector<T> & &d2a, std::vector<T> & &da)
  
  copy std::vector<T> to std::vector<T>(unroll vecOfvecs into vector) - used by ProcessApplicInterface::write_parameters_files - RWH
• template<typename T>
  void copy_data (const std::map<int, T> &im, std::vector<T> &da)
  copy map<int, T> to std::vector<T> (discard integer keys) - used by SurrBasedGlobalMinimizer::core_run - RWH

• template<typename OrdinalType, typename ScalarType>
  void copy_data (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv1, Teuchos::SerialDenseVector<OrdinalType, ScalarType> &sdv2)
  copy Teuchos::SerialDenseVector<OrdinalType, ScalarType> to same (used in place of operator= when a deep copy is required) - used by Response - MSE

• template<typename OrdinalType, typename ScalarType>
  void copy_data (const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm1, Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &sdm2)
  copy Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> to same (used in place of operator= when a deep copy is required) - used by Response - MSE

• void copy_data (const Teuchos::SerialDenseMatrix<OrdinalType, ScalarType> &ssdm1, Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> &ssdm2)
  copy Teuchos::SerialSymDenseMatrix<OrdinalType, ScalarType> to same (used in place of operator= when a deep copy is required) - used by Response - MSE

• template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv, ScalarType *ptr, const OrdinalType2 ptr_len)
  copy ScalarType* to Teuchos::SerialDenseVector<OrdinalType1, ScalarType> - used by NL2SOLLeastSq::core_run - RWH

• template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv, Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &ptr, const OrdinalType2 ptr_len)
  copy ScalarType* to Teuchos::SerialDenseVector<OrdinalType1, ScalarType> - used by ScalingModel::response_modify_n2s - RWH

• template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv, Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &ssdv)
  copy SerialDenseVector<> to Array<SerialDenseVector<> > - used by ConcurrentMetaIterator constructor - RWH

Taken from pecos/src/MathTools.hpp, BUT not templated because the implementation is specific to RealMatrix.
12.1. DAKOTA NAMESPACE REFERENCE

- template<typename vecType1, typename vecType2>
  void copy_data_partial (const vecType1 &source, size_t source_start_idx, vecType2 &target, size_t target_start_idx, size_t len)

  copy a portion arbitrary vector to all of another arbitrary vector

- template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data_partial (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv1, OrdinalType2 start_index1, OrdinalType2 num_items, Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv2, OrdinalType2 start_index2)

  copy portion of first SerialDenseVector to second SerialDenseVector - used by DataTransformModel::vars_mapping - RWH

- template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data_partial (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv1, Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv2, OrdinalType2 start_index2)

  copy all of first SerialDenseVector to portion of second SerialDenseVector - used by MixedVariables - RWH, NLS-SOLLeastSq - BMA

- template<typename OrdinalType1, typename OrdinalType2, typename ScalarType>
  void copy_data_partial (const Teuchos::SerialDenseVector<OrdinalType1, ScalarType> &sdv1, std::vector<ScalarType> &da2, OrdinalType2 start_index2)

  copy all of first SerialDenseVector to portion of second SerialDenseVector - used by SharedSurfpackApproxData::merge_variable_arrays - RWH

- template<typename T>
  void copy_data_partial (const std::vector<T> &da1, size_t start_index1, size_t num_items, std::vector<T> &da2)

  copy portion of first Array<T> to all of second Array<T> - used by SharedResponseDataRep constructor - RWH

- template<typename T>
  void copy_data_partial (const std::vector<T> &da1, std::vector<T> &da2, size_t start_index2)

  copy all of first Array<T> to portion of second Array<T> - used by ParamStudy::multidim_loop - RWH

- template<typename T, boost::multi_array<T, 1> bma>
  void copy_data_partial (const std::vector<T> &da, boost::multi_array<T, 1> bma, size_t start_index2)

  copy all of first Array<T> to portion of boost::multi_array<T, 1> - used by RelaxedVariables - RWH

- template<typename VectorType>
  void copy_column_vector (const RealMatrix &m, RealMatrix::ordinalType j, VectorType &col)

  Copies a column of a Teuchos SerialDenseMatrix<int,Real> to std::vector<Real>

- template<typename VectorType>
  void copy_row_vector (const RealMatrix &m, RealMatrix::ordinalType i, VectorType &row)

  Copies a row of a Teuchos SerialDenseMatrix<int,Real> to std::vector<Real>

- template<typename ScalarType>
  void insert_row_vector (const std::vector<ScalarType> &row, RealMatrix::ordinalType i, RealMatrix &m)

  Inserts a std::vector<Real> into a row of a Teuchos SerialDenseMatrix<int,Real>
• void merge_data_partial (const IntVector &d_vec, RealVector &m_vec, size_t start_index_ma)

  merge a discrete integer vector into a single continuous vector

• void merge_data_partial (const IntVector &d_vec, RealArray &m_array, size_t start_index_ma)

  merge a discrete integer vector into a single continuous array

• template<typename OrdinalType , typename ScalarType >
  const ScalarType & set_index_to_value (OrdinalType index, const std::set<ScalarType> &values)

  retrieve the set value corresponding to the passed index

• template<typename ScalarType >
  size_t set_value_to_index (const ScalarType &value, const std::set<ScalarType> &values)

  calculate the set index corresponding to the passed value

• template<typename OrdinalType , typename KeyType , typename ValueType >
  const KeyType & map_index_to_key (OrdinalType index, const std::map<KeyType, ValueType> &pairs)

  retrieve the set index corresponding to the passed key

• template<typename OrdinalType , typename KeyType , typename ValueType >
  const ValueType & map_index_to_value (OrdinalType index, const std::map<KeyType, ValueType> &pairs)

  retrieve the set value corresponding to the passed key

• template<typename KeyType , typename ValueType >
  void map_keys_to_set (const std::map<KeyType, ValueType> &source_map, std::set<KeyType> &target_set)

  calculate the map index corresponding to the passed key

• template<typename KeyType , typename ValueType >
  size_t map_key_to_index (const KeyType &key, const std::map<KeyType, ValueType> &pairs)

  calculate the map index corresponding to the passed key

• template<typename KeyType , typename ValueType >
  size_t map_value_to_index (const ValueType &value, const std::map<KeyType, ValueType> &pairs)

  calculate the map index corresponding to the passed value

• template<typename OrdinalType , typename ScalarType >
  void x_y_pairs_to_x_set (const Teuchos::SerialDenseVector<OrdinalType, ScalarType> &xy_pairs, std::set<ScalarType> &x_set)

  convert a SerialDenseVector of head-to-tail (x,y) pairs into a std::set of (x), discarding the y values

• template<typename ContainerType >
  size_t find_index (const ContainerType &c, const typename ContainerType::value_type &search_data)

  generic find_index (inactive)

• template<typename T >
  size_t find_index (const boost::multi_array<T, 1> &bma, const T &search_data)

  compute the index of an entry within a boost::multi_array

• size_t find_index (SizetMultiArrayConstView bmcv, size_t search_data)

  compute the index of an entry within a boost::multi_array view

• size_t find_index (StringMultiArrayConstView bmcv, const String &search_data)

  compute the index of an entry within a boost::multi_array view

• template<typename ListT >
  size_t find_index (const ListT &l, const typename ListT::value_type &val)

  compute the index of an entry within a std::list
• template<typename ListT>
  ListT::const_iterator find_if (const ListT &c, bool(*test_fn)(const typename ListT::value_type &, const std::string &), const std::string &test_fn_data)
  return an iterator to the first list element satisfying the predicate test_fn w.r.t. the passed test_fn_data; end if not found

• template<typename VectorType, typename ScalarType>
  void copy_data (const std::vector<VectorType> &va, ScalarType *ptr, int ptr_len)

• void copy_data (SizetMultiArrayConstView ma, SizetArray &da)
  copy boost::multi_array_view to Array - used by ActiveSet::derivative_vector - RWH

• void copy_data (StringMultiArrayConstView ma, StringArray &da)
  copy boost::multi_array_view to Array - used by Pecos::copy_data - RWH

• template<typename DakContainerType>
  bool contains (const DakContainerType &v, const typename DakContainerType::value_type &val)
  return true if the item val appears in container v

• void abort_handler (int code)
  global function which handles serial or parallel aborts

• void abort_throw_or_exit (int dakota_code)
  throw or exit depending on abort_mode

• void register_signal_handlers ()
  Tie various signal handlers to Dakota’s abort_handler function.

• void mpi_debug_hold ()
  Global function to hold Dakota processes to help with MPI debugging.

• template<typename T>
  T abort_handler_t (int code)

• void svd (RealMatrix &matrix, RealVector &singular_vals, RealMatrix &v_trans, bool compute_vectors=true)
  Compute the SVD of an arbitrary matrix \( A = U S V^T \).

• void singular_values (RealMatrix &matrix, RealVector &singular_values)
  compute the singular values without storing any singular vectors (A will be destroyed)

• int qr (RealMatrix &A)
  Compute an in-place QR factorization \( A = QR \).

• int qr_rsolve (const RealMatrix &q_r, bool transpose, RealMatrix &rhs)
  Perform a multiple right-hand sides \( Rinv \ast rhs \) solve using the \( R \) from a qr factorization.

• double det_AtransA (RealMatrix &A)
  Use SVD to compute \( \det(A^{*}A) \), destroying A with the SVD.

• ResultsKeyType make_key (const StrStrSizet &iterator_id, const std::string &data_name)
  Make a full ResultsKeyType from the passed iterator_id and data_name.

•MetaDataValueType make_metadatavalue (StringMultiArrayConstView labels)
  create MetaDataValueType from the passed strings

• MetaDataValueType make_metadatavalue (StringMultiArrayConstView cv_labels, StringMultiArrayConstView div_labels, StringMultiArrayConstView drv_labels, const StringArray &resp_labels)
  create MetaDataValueType from the passed strings

• MetaDataValueType make_metadatavalue (const StringArray &resp_labels)
  create MetaDataValueType from the passed strings

• MetaDataValueType make_metadatavalue (const std::string &)
  create MetaDataValueType from the passed string
create MetaDataValueType from the passed strings

• MetaDataValueType make_metadatavalue (const std::string &, const std::string &)
create MetaDataValueType from the passed strings

• MetaDataValueType make_metadatavalue (const std::string &, const std::string &, const std::string &)
create MetaDataValueType from the passed strings

• MetaDataValueType make_metadatavalue (const std::string &, const std::string &, const std::string &, const std::string &)

• MetaDataValueType make_metadatavalue (StringMultiArrayConstView cv_labels, StringMultiArrayConstView div_labels, StringMultiArrayConstView dsv_labels, StringMultiArrayConstView drv_labels, const StringArray &resp_labels)

• std::istream & operator>>(std::istream &s, ActiveSet &set)
  std::istream extraction operator for ActiveSet. Calls read(std::istream&).

• std::ostream & operator<<(std::ostream &s, const ActiveSet &set)
  std::ostream insertion operator for ActiveSet. Calls write(std::ostream&).

• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, ActiveSet &set)
  MPIUnpackBuffer extraction operator for ActiveSet. Calls read(MPIUnpackBuffer&).

• MPIUnpackBuffer & operator<<(MPIUnpackBuffer &s, const ActiveSet &set)
  MPIUnpackBuffer insertion operator for ActiveSet. Calls write(MPIUnpackBuffer&).

• bool operator!= (const ActiveSet &set1, const ActiveSet &set2)
  inequality operator for ActiveSet

• std::istream & operator>>(std::istream &s, Constraints &con)
  std::istream extraction operator for Constraints

• std::ostream & operator<<(std::ostream &s, const Constraints &con)
  std::ostream insertion operator for Constraints

• std::string re_match (const std::string &token, const boost::regex &re)
  Global utility function to ease migration from CtelRegExp to Boost.Regex.

• bool interface_id_compare (const Interface &interface_in, const void *id)
  global comparison function for Interface

• bool method_id_compare (const Iterator &iterator, const void *id)
  global comparison function for Iterator

• bool model_id_compare (const Model &model, const void *id)
  global comparison function for Model

• bool operator==(const Model &m1, const Model &m2)
  equality operator for Envelope is true if same letter instance

• bool operator!=(const Model &m1, const Model &m2)
  inequality operator for Envelope is true if different letter instance

• template<typename VecT>
  void get_initial_values (const Model &model, VecT &values)

• template<typename VecT>

  Would like to combine the previous adapter with this one (based on APPSOptimizer and COLINOptimizer) and then see how much more generalization is needed to support other TPLs like JEGA.

• bool responses_id_compare (const Response &resp, const void *id)
  global comparison function for Response
• std::istream & operator>>(std::istream &s, Response &response)
  std::istream extraction operator for Response. Calls read(std::istream&).
• std::ostream & operator<<(std::ostream &s, const Response &response)
  std::ostream insertion operator for Response. Calls write(std::ostream&).
• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, Response &response)
  MPIUnpackBuffer extraction operator for Response. Calls read(MPIUnpackBuffer&).
• MPIPackBuffer & operator<<(MPIPackBuffer &s, const Response &response)
  MPIPackBuffer insertion operator for Response. Calls write(MPIPackBuffer&).
• bool operator!=(const Response &resp1, const Response &resp2)
  inequality operator for Response

• bool variables_id_compare (const Variables &vars, const void *id)
  global comparison function for Variables
• std::istream & operator>>(std::istream &s, Variables &vars)
  std::istream extraction operator for Variables.
• std::ostream & operator<<(std::ostream &s, const Variables &vars)
  std::ostream insertion operator for Variables.
• MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, Variables &vars)
  MPIUnpackBuffer extraction operator for Variables.
• MPIPackBuffer & operator<<(MPIPackBuffer &s, const Variables &vars)
  MPIPackBuffer insertion operator for Variables.
• bool operator!=(const Variables &vars1, const Variables &vars2)
  inequality operator for Variables

• template<typename OrdinalType , typename ScalarType1 , typename ScalarType2 , typename ScalarType3 , typename ScalarType4>

  free function to write Variables data vectors in input spec ordering
• template<typename OrdinalType , typename ScalarType1 , typename ScalarType2 , typename ScalarType3 , typename ScalarType4>
  void write_ordered (std::ostream &s, const SizetArray &comp_totals, const Teuchos::SerialDenseVector<OrdinalType, ScalarType1>&c_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType2>&di_vector, const boost::multi_array<ScalarType3, 1>&ds_array, const Teuchos::SerialDenseVector<OrdinalType, ScalarType4>&dr_vector)
free function to write Variables data vectors in input spec ordering

- template<typename ScalarType>
  void write_ordered (std::ostream &s, const SizetArray &comp_totals, const std::vector<ScalarType> &c_array, const std::vector<ScalarType> &di_array, const std::vector<ScalarType> &ds_array, const std::vector<ScalarType> &dr_array)

free function to write Variables data vectors in input spec ordering

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataEnvironment &data)
  MPIPackBuffer insertion operator for DataEnvironment.

- MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, DataEnvironment &data)
  MPIUnpackBuffer extraction operator for DataEnvironment.

- std::ostream & operator<<(std::ostream &s, const DataEnvironment &data)
  std::ostream insertion operator for DataEnvironment

- String interface_enum_to_string (unsigned short interface_type)

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataInterface &data)
  MPIPackBuffer insertion operator for DataInterface.

- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataInterface &data)
  MPIUnpackBuffer extraction operator for DataInterface.

- std::ostream & operator<<(std::ostream &s, const DataInterface &data)
  std::ostream insertion operator for DataInterface

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataMethod &data)
  MPIPackBuffer insertion operator for DataMethod.

- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataMethod &data)
  MPIUnpackBuffer extraction operator for DataMethod.

- std::ostream & operator<<(std::ostream &s, const DataMethod &data)
  std::ostream insertion operator for DataMethod

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataModel &data)
  MPIPackBuffer insertion operator for DataModel.

- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataModel &data)
  MPIUnpackBuffer extraction operator for DataModel.

- std::ostream & operator<<(std::ostream &s, const DataModel &data)
  std::ostream insertion operator for DataModel

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataResponses &data)
  MPIPackBuffer insertion operator for DataResponses.

- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataResponses &data)
  MPIUnpackBuffer extraction operator for DataResponses.

- std::ostream & operator<<(std::ostream &s, const DataResponses &data)
  std::ostream insertion operator for DataResponses

- MPIPackBuffer & operator<< (MPIPackBuffer &s, const DataVariables &data)
  MPIPackBuffer insertion operator for DataVariables.

- MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, DataVariables &data)
  MPIUnpackBuffer extraction operator for DataVariables.

- std::ostream & operator<<(std::ostream &s, const DataVariables &data)
  std::ostream insertion operator for DataVariables

12.1. DAKOTA NAME SPACE REFERENCE

- **void linear_interpolate_1d** (const RealMatrix &build_pts, const RealVector &build_vals, const RealMatrix &build_grads, const RealSymMatrixArray &build_hessians, const RealMatrix &pred_pts, RealVector &pred_vals, RealMatrix &pred_grads, RealSymMatrixArray &pred_hessians)
  
Returns the value of a 1D function \( f \) and its gradient and hessians (if available) at the points of vector \( \text{pred} \_\text{pts} \) using linear interpolation. The vector \( \text{build} \_\text{pts} \) specifies the coordinates of the underlying interval at which the values (\( \text{build} \_\text{vals} \)) of the function \( f \) are known. The length of output \( \text{pred} \_\text{vals} \) is equal to the length of \( \text{pred} \_\text{pts} \). This function assumes the build_pts is in ascending order.

- **void symmetric_eigenvalue_decomposition** (const RealSymMatrix &matrix, RealVector &eigenvalues, RealMatrix &eigenvectors)
  
Computes the eigenvalues and, optionally, eigenvectors of a real symmetric matrix \( A \).

- **void compute_column_means** (RealMatrix &matrix, RealVector &avg_vals)
  
Compute the means of each column of an arbitrary matrix.

- **void sort_vector** (const RealVector &vec, RealVector &sort_vec, IntVector &indices)
  
Sort incoming vector with result and corresponding indices returned in passed arguments.

- **void sort_matrix_columns** (const RealMatrix &mat, RealMatrix &sort_mat, IntMatrix &indices)
  
Sort incoming matrix columns with result and corresponding indices returned in passed arguments.

- **bool is_matrix_symmetric** (const RealMatrix &matrix)
  
Test if incoming matrix is symmetric.

- **template<typename O, typename T>**
  
int binary_search (T target, Teuchos::SerialDenseVector<O, T> &data)
  
find the interval containing a target value. This function assumes the data is in ascending order.

- **Real getdist** (const RealVector &x1, const RealVector &x2)

- **Real mindist** (const RealVector &x, const RealMatrix &xset, int except)

- **Real mindistindx** (const RealVector &x, const RealMatrix &xset, const IntArray &indx)

- **Real getRmax** (const RealMatrix &xset)

- **int start_grid_computing** (char *analysis_driver_script, char *params_file, char *results_file)

- **int stop_grid_computing**

- **int perform_analysis** (char *iteration_num)

- **int length** (const StringMultiArrayConstView &vec)
  
Return the length of a StringMultiArrayConstView.

- **H5::DataType h5_file_dtype** (const Real &)
  
Return the HDF5 datatype to store a Real.

- **H5::DataType h5_file_dtype** (const int &)
  
Return the HDF5 datatype to store a int.

- **H5::DataType h5_file_dtype** (const size_t &)
  
Return the HDF5 datatype to store a int.

- **H5::DataType h5_file_dtype** (const char *)
  
Return the HDF5 datatype to store a string.

- **H5::DataType h5_file_dtype** (const String)
  
Return the HDF5 datatype to store a string.

- **H5::DataType h5_mem_dtype** (const Real &)
  
Return the HDF5 datatype to read a Real in memory.

- **H5::DataType h5_mem_dtype** (const int &)
  
Return the HDF5 datatype to read an int in memory.

- **H5::DataType h5_mem_dtype** (const size_t &)
Return the HDF5 datatype to read a size_t in memory.
- **H5::DataType** `h5_mem_dtype` (const short &)
  Return the HDF5 datatype to read a size_t in memory.
- **H5::DataType** `h5_mem_dtype` (const char *)
  Return the HDF5 datatype to read a string in memory.
- **H5::DataType** `h5_mem_dtype` (const String)
  Return the HDF5 datatype to read a string in memory.
- template<typename T>
  int `length` (const std::vector<T> &vec)
  Return the length of several types.
- template<typename T>
  int `length` (const Teuchos::SerialDenseVector<int, T> &vec)
  Return the length of an SDV.
- template<typename T>
  std::vector<const char *> `pointers_to_strings` (const T &data)
  Return a vector of pointers to strings.
- template<typename T>
  string `asstring` (const T &val)
  Creates a string from the argument val using an ostringstream.
- **PACKBUF** (int, MPI_INT) `PACKBUF`(u_int

- static void Vchk_ContinuousIntervalUnc (DataVariablesRep *dv, size_t offset, Var_Info *vi)
- static void Vgen_ContinuousIntervalUnc (DataVariablesRep *dv, size_t offset)
- static void Vchk_DiscreteIntervalUnc (DataVariablesRep *dv, size_t offset, Var_Info *vi)
- static void Vgen_DiscreteIntervalUnc (DataVariablesRep *dv, size_t offset)

Check the continuous interval uncertain input data and populate DataVariables::continuousIntervalUncBasicProbs; map keys (real intervals) are checked for uniqueness because we don’t have a theoretically sound way to combine duplicate intervals.

- static void Vgen_ContinuousIntervalUnc (DataVariablesRep *dv, size_t offset)
- static void Vchk_DiscreteIntervalUnc (DataVariablesRep *dv, size_t offset, Var_Info *vi)
- static void Vgen_DiscreteIntervalUnc (DataVariablesRep *dv, size_t offset)

Check the discrete interval uncertain input data and populate DataVariables::discreteIntervalUncBasicProbs; map keys (integer intervals) are checked for uniqueness because we don’t have a theoretically sound way to combine duplicate intervals.

- static void Vgen_DiscreteIntervalUnc (DataVariablesRep *dv, size_t offset)
- static bool check_set_keys (size_t num_v, size_t ds_len, const char *kind, IntArray *input_nds, int &avg_num_ds)

validate the number of set elements (values) given the number of variables and an optional apportionment with elements per variable; return the average number per variable if equally distributed
- static void Vchk_DSet (size_t num_v, const char *kind, IntArray *input_dsi, IntVector *input_dsi, IntSetArray &dsi_all, IntVector &dsi_init_pt)
check discrete sets of integers (design and state variables); error if a duplicate value is specified error if not ordered to prevent user confusion

- static void Vchk_Dset (size_t num_v, const char *kind, IntArray *input_ndsi, IntVector *input_dsi, RealVector *input_dspin, IntRealMapArray &dsi_vals_probs, IntVector &dsi_init_pt)

check discrete sets of integers (uncertain variables); error if a duplicate value is specified error if not ordered to prevent user confusion

- static void Vchk_DSet (size_t num_v, const char *kind, IntArray *input_ndss, StringArray *input_dss, StringSetArray &dsr, RealVector &dsr_probs, IntVector &dsr_init_pt)

- static void Vchk_DSet (size_t num_v, const char *kind, IntArray *input_ndss, StringArray *input_dss, IntRealMapArray &dsr_vals_probs, StringArray &dsr_init_pt)

template<class ContainerT>
void flatten_num_array (const std::vector< ContainerT > &input_array, IntArray *pia)

Free convenience function that flatten sizes of an array of std containers; takes an array of containers and returns an
IntArray containing the sizes of each container in the input array. Note: Did not specialize for vector<RealVector>
as no current use cases.

MPIUnpackBuffer & operator>> (MPIUnpackBuffer &s, ParallelLevel &pl)

MPIUnpackBuffer extraction operator for ParallelLevel. Calls read(MPIUnpackBuffer&).
12.1. DAKOTA NAMESPACE REFERENCE

- **MPIPackBuffer & operator<< (MPIPackBuffer &s, const ParallelLevel &pl)**
  
  *MPIPackBuffer* insertion operator for *ParallelLevel*. Calls `write(MPIPackBuffer&`).

- **std::istream & operator>>(std::istream &s, ParamResponsePair &pair)**
  
  *std::istream* extraction operator for *ParamResponsePair*.

- **std::ostream & operator<<(std::ostream &s, const ParamResponsePair &pair)**
  
  *std::ostream* insertion operator for *ParamResponsePair*.

- **MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, ParamResponsePair &pair)**
  
  *MPIUnpackBuffer* extraction operator for *ParamResponsePair*.

- **MPIPackBuffer & operator<<(MPIPackBuffer &s, const ParamResponsePair &pair)**
  
  *MPIPackBuffer* insertion operator for *ParamResponsePair*.

- **bool operator==(const ParamResponsePair &pair1, const ParamResponsePair &pair2)**
  
  equality operator for *ParamResponsePair*.

- **bool operator!=(const ParamResponsePair &pair1, const ParamResponsePair &pair2)**
  
  inequality operator for *ParamResponsePair*.

- **static void *binsearch (void *kw, size_t kwsize, size_t n, const char *key)**

- **static const char *begins (const String &entry_name, const char *s)**

- **static void Bad_name (String entry_name, const char *where)**

- **static void Locked_db ()**

- **static void Null_rep (const char *who)**

- **static void Null_rep1 (const char *who)**

- **boost::regex **PARAMS_TOKEN** ("\{\{PARAMETERS\}\")**

- **boost::regex **RESULTS_TOKEN** ("\{\{RESULTS\}\")**

- **String substitute_params_and_results (const String &driver, const String &params, const String &results)**

  Substitute parameters and results file names into driver strings.

- **MPIUnpackBuffer & operator>>(MPIUnpackBuffer &s, ProgramOptions &progopt)**
  
  *MPIUnpackBuffer* extraction operator.

- **MPIPackBuffer & operator<<(MPIPackBuffer &s, const ProgramOptions &progopt)**
  
  *MPIPackBuffer* insertion operator.

- **bool set_compare (const ParamResponsePair &database_pr, const ActiveSet &search_set)**

  search function for a particular *ParamResponsePair* within a PRPList based on *ActiveSet* content (request vector and derivative variables vector).

- **bool id_vars_exact_compare (const ParamResponsePair &database_pr, const ParamResponsePair &search_pr)**

  search function for a particular *ParamResponsePair* within a PRPMultiIndex.

- **std::size_t hash_value (const ParamResponsePair &prp)**

  hash_value for *ParamResponsePairs* stored in a PRPMultiIndex.

- **PRPCacheHIter hashedCacheBegin (PRPCache &prp_cache)**

  hashed definition of cache begin.

- **PRPCacheHIter hashedCacheEnd (PRPCache &prp_cache)**

  hashed definition of cache end.

- **PRPQueueHIter hashedQueueBegin (PRPQueue &prp_queue)**

  hashed definition of queue begin.

- **PRPQueueHIter hashedQueueEnd (PRPQueue &prp_queue)**

  hashed definition of queue end.
• PRPCacheHIter lookup_by_val (PRPMultiIndexCache &prp_cache, const ParamResponsePair &search_pr)
  find a ParamResponsePair based on the interface id, variables, and ActiveSet search data within search_pr.
• PRPCacheHIter lookup_by_val (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const
  Variables &search_vars, const ActiveSet &search_set)
  find a ParamResponsePair within a PRPMultiIndexCache based on the interface id, variables, and ActiveSet search data.
• PRPCacheOIter lookup_by_nearby_val (PRPMultiIndexCache &prp_cache, const String &search_interface_id, const
  Variables &search_vars, const ActiveSet &search_set, Real tol)
• PRPCacheOIter lookup_by_ids (PRPMultiIndexCache &prp_cache, const IntStringPair &search_ids)
  find a ParamResponsePair within a PRPMultiIndexCache based on search_ids (i.e. std::pair<eval_id,interface_id>) search data
• PRPCacheOIter lookup_by_ids (PRPMultiIndexCache &prp_cache, const IntStringPair &search_ids, const
  ParamResponsePair &search_pr)
• PRPQueueHIter lookup_by_val (PRPMultiIndexQueue &prp_queue, const ParamResponsePair &search_pr)
  find a ParamResponsePair based on the interface id, variables, and ActiveSet search data within search_pr.
• PRPQueueHIter lookup_by_val (PRPMultiIndexQueue &prp_queue, const String &search_interface_id, const
  Variables &search_vars, const ActiveSet &search_set)
  find a ParamResponsePair within a PRPMultiIndexQueue based on interface id, variables, and ActiveSet search data
• PRPQueueOIter lookup_by_eval_id (PRPMultiIndexQueue &prp_queue, int search_id)
  find a ParamResponsePair within a PRPMultiIndexQueue based on search_id (i.e. integer eval_id) search data
• void print_usage (std::ostream &s)
  print restart utility help message
• void print_restart (StringArray pos_args, String print_dest)
  print a restart file
• void print_restart_pdb (StringArray pos_args, String print_dest)
  print a restart file (PDB format)
• void print_restart_tabular (StringArray pos_args, String print_dest, unsigned short tabular_format, int tabular_precision)
  print a restart file (tabular format)
• void read_neutral (StringArray pos_args)
  read a restart file (neutral file format)
• void repair_restart (StringArray pos_args, String identifier_type)
  repair a restart file by removing corrupted evaluations
• void concatenate_restart (StringArray pos_args)
  concatenate multiple restart files
• String method_hdf5_link_name (const StrStrSizet &iterator_id)
  Create a method name (HDF5 link name) from iterator_id.
• String execution_hdf5_link_name (const StrStrSizet &iterator_id)
  Create an execution name (HDF5 link name) from iterator_id.
• String object_hdf5_link_name (const StrStrSizet &iterator_id, const StringArray &location)
• template<typename ScaleType>
  String scale_hdf5_link_name (const StrStrSizet &iterator_id, const StringArray &location, const ScaleType &scale)
Create a scale name (hdf5 link name) for a scale from an iterator jd, the name of the result, the name of the response (can be empty), and the scale itself.

- static HANDLE * wait_setup (std::map< pid_t, int > *M, size_t * pn)
- static int wait_for_one (size_t n, HANDLE * h, int req1, size_t * pi)
- void gauss_legendre_pts_wts_1d (int level, RealVector & result_0, RealVector & result_1)
- void lagrange_interpolation_1d (const RealVector & samples, const RealVector & abscissa, const RealVector & values, RealVector & result)
- void kronecker_product_2d (const RealMatrix & matrix1, const RealMatrix & matrix2, RealMatrix & matrix)
- void get_chebyshev_points (int order, RealVector & points)
- void chebyshev_derivative_matrix (int order, RealMatrix & derivative_matrix, RealVector & points)
- int salinas_main (int argc, char * argv[], MPI_Comm * comm)

Variables

- PRPCache data_pairs
  contains all parameter/response pairs.
- double PI = boost::math::constants::pi<double>(
  constant pi
- double HALF_LOG_2PI = std::log(2.0 * PI)/2.0
  constant log(2*π)/2
- short abort_mode = ABORT_EXITS
  by default Dakota exits or calls MPI_Abort on errors
- std::ostream * dakota_cout = &std::cout
  DAKOTA stdout initially points to < std::cout, but may be redirected to a tagged ofstream if there are < concurrent iterators.
- std::ostream * dakota_cerr = &std::cerr
  DAKOTA stderr initially points to < std::cerr, but may be redirected to a tagged ofstream if there are < concurrent iterators.
- ResultsManager iterator_results_db
  Global results database for iterator results.
- EvaluationStore evaluation_store_db
  Global database for evaluation storage.
- int write_precision = 10
  used in ostream data output functions < (restart_util.cpp overrides default value)
- MPIManager dummy_mpi_mgr
  dummy MPIManager for ref initialization
- ProgramOptions dummy_prg_opt
  dummy ProgramOptions for ref initialization
- OutputManager dummy_out_mgr
dummy OutputManager for ref initialization

- ParallelLibrary dummy_lib
dummy ParallelLibrary for ref initialization

- ProblemDescDB dummy_db
dummy ProblemDescDB for ref initialization

- int mc_ptr_int = 0
global pointer for ModelCenter API

- int dc_ptr_int = 0
global pointer for ModelCenter eval DB

- ProblemDescDB * Dak_pddb
  set by ProblemDescDB, for use in parsing

- const size_t NPOS = ~(size_t)0
  special value returned by index() when entry not found

- const double BIG_REAL_BOUND = 1.0e+30
  bound beyond which constraints are considered inactive

- static UShortStrBimap method_map
  bimap between method enums and strings; only used in this compilation unit

- static UShortStrBimap submethod_map
  bimap between sub-method enums and strings; only used in this compilation unit (using bimap for consistency, though at time of addition, only uni-directional mapping is supported)

- Interface dummy_interface
dummy Interface object used for mandatory < reference initialization or default virtual < function return by reference when a real < Interface instance is unavailable

- Model dummy_model
dummy Model object used for mandatory reference < initialization or default virtual function < return by reference when a real Model instance < is unavailable

- Iterator dummy_iterator
dummy Iterator object used for mandatory < reference initialization or default virtual < function return by reference when a real < Iterator instance is unavailable

- Dakota_funcs * DF
- Dakota_funcs DakFuncs0
- const Real DSET_FILL_VAL = NAN

- static Var_uinfo CEUVLbl[CEUVar_Nkinds]
- static Var_uinfo DEUIVLbl[DEUIVar_Nkinds]
- static Var_uinfo DEUSVLbl[DEUSVar_Nkinds]
- static Var_uinfo DEURVLbl[DEURVar_Nkinds]
- static Var_uinfo DiscSetLbl[DiscSetVar_Nkinds]
- static VarLabelChk DesignAndStateLabelsCheck[]

Variables label array designations for design and state. All non-uncertain variables need to be in this array. Used in check_variables_node to check lengths and make_variable_defaults to build labels.

- static VLreal VLUncertainReal[NUM_unc_REAL_CONT]
  Variables labels/bounds/values check array for real-valued uncertain variables; one array entry per contiguous container. These associate the individual variables given by, e.g., CAUVLbl, with the contiguous container in which they are stored.

- static VLint VLUncertainInt[NUM_unc_INT_CONT]
  Variables labels/bounds/values check array for integer-valued uncertain variables; one array entry per contiguous container. These associate the individual variables given by, e.g., DAUIVLbl, with the contiguous container in which they are stored.

- static VLstr VLUncertainStr[NUM_unc_STR_CONT]
  Variables labels/bounds/values check array for string-valued uncertain variables; one array entry per contiguous container. These associate the individual variables given by, e.g., DAUSVLbl, with the contiguous container in which they are stored.

- static int VLR_aleatory[NUM_unc_REAL_CONT] = {1, 0, 0, 0}
  which uncertain real check array containers are aleatory (true = 1)

- static int VLI_aleatory[NUM_unc_INT_CONT] = {1, 0}
  which uncertain integer check array containers are aleatory (true = 1)

- static int VLS_aleatory[NUM_unc_STR_CONT] = {1, 0}
  which uncertain string check array containers are aleatory (true = 1)

- static Var_check var_mp_check_cv[]
- static Var_check var_mp_check_dset[]
- static Var_check var_mp_check_cau[]

This is used within check_variables_node: Var_RealBoundIPCheck() is applied to validate bounds and initial points.
• static Var iCheck var_mp_drage []
  This is used in check_variables_node(): Var_InBoundIPCheck() is applied to validate bounds and initial points,
  and in make_variable_defaults(): Vgen_* is called to infer bounds.
• TKFactoryDIPC tk_factory_dipc ("dakota_dipc.tk")
  Static registration of RW TK with the QUESO TK factory.
• TKFactoryDIPCLogit tk_factory_dipclogit ("dakota_dipc_logit.tk")
  Static registration of Logit RW TK with the QUESO TK factory.
• static time_t start_time
• const char *SCI_FIELDE_NAMES []
• const int SCI_NUMBER_OF_FIELDS = 26
• const int LARGE_SCALE = 100
  a (perhaps arbitrary) definition of large scale; choose a large-scale algorithm if numVars > = LARGE_SCALE
• const double POW_VAL = 1.0
  offset used text_book exponent: 1.0 is nominal, 1.4 used for B&B testing
• const String LEV_REF = "Dakota"
  levenshtein_distance computes the distance between its argument and this

12.1.1 Detailed Description

The primary namespace for DAKOTA. The Dakota namespace encapsulates the core classes of the DAKOTA
framework and prevents name clashes with third-party libraries from methods and packages. The C++ source
files defining these core classes reside in Dakota/src as *.pp.

Work directory TODO
  Doc: we will search for drivers in PATH, workdir (.), RUNDIR
  Remove legacy utilities (once concepts migrated)

• In general review cases with race conditions such as single dir getting created / removed for each eval.

• Verify creation/removal in parallel runs (eval_comm_rank 0?); are there scenarios where we should create
  once ahead of time?

• Enforce tagging when asynch is possible

• Challenge of shared vs. distinct filesystems

• Verify template files exist at parse and that workdir parent exists

• Verify behavior when directory exists

• Allow recursive copy to descend to overwrite leaf nodes when directories already exist

• Old code setting permissions mask 0700

• Workdir with multiple analysis components (per analysis)

• Workdirs shared for each unique concurrent eval (not per eval ID)

• Evaluate environment variables

• How to manage drivers that want just param names in the work dir?!? I think arg_adjust is removing the
directory args that aren’t needed.
• Consider making the class members for directories and files bfs::paths
• Behavior of file_save when directory not saved
• Error checking: directory was created directory path is a directory directory has rwx for user population worked try/catch around all fs operations
• Verify correct handling of relative vs. absolute files/dirs
• Enforce that first argument must be an executable program for all drivers; at least for fork
• Historical behaviors / features to consider Template dirs on PATH: likely no longer
  Allowed FOO=zorch and would set that in the environment; could allow separate env var specification; otherwise likely remove
• TODO: pass environment to exec as separate pointer

TESTING NEEDS
• Allow nested quotes in driver, at least one level: analysis_driver = ’ad.sh ”-opt foo -opt1 goo’’ p.in.1 r.out.1
• Env vars will be carried along for now, not expanded before eval; set some helpful env vars before the eval.

12.1.2 Typedef Documentation

typedef bmi::multi_index_container<Dakota::ParamResponsePair, bmi::indexed_by<bmi::ordered_non_unique<bmi::tag<ordered>><bmi::const_mem_fun<Dakota::ParamResponsePair, const IntStringPair&>, &Dakota::ParamResponsePair::eval_interface_ids>>, bmi::hashed_non_unique<bmi::tag<hashed>><bmi::identity<Dakota::ParamResponsePair>, partial_prp_hash, partial_prp_equality>><PRPMultiIndexCache

Boost Multi-Index Container for globally caching ParamResponsePairs.

For a global cache, both evaluation and interface id’s are used for tagging ParamResponsePair records.

typedef bmi::multi_index_container<Dakota::ParamResponsePair, bmi::indexed_by<bmi::ordered_unique<bmi::tag<ordered>><bmi::const_mem_fun<Dakota::ParamResponsePair, int, &Dakota::ParamResponsePair::eval_id>><bmi::hashed_non_unique<bmi::tag<hashed>><bmi::identity<Dakota::ParamResponsePair, partial_prp_hash, partial_prp_equality>><PRPMultiIndexQueue

Boost Multi-Index Container for locally queueing ParamResponsePairs.

For a local queue, interface id’s are expected to be consistent, such that evaluation id’s are sufficient for tracking particular evaluations.

12.1.3 Enumeration Type Documentation

anonymous enum

Sub-methods, including sampling, inference algorithm, opt algorithm types.

Enumerator

SUBMETHOD_COLLABORATIVE Type of hybrid meta-iterator:
12.1.4 Function Documentation

**CommandShell & flush ( CommandShell & shell )**

Convenient shell manipulator function to "flush" the shell.

- Global convenience function for manipulating the shell; invokes the class member flush function.
- References CommandShell::flush().
- Referenced by HDF5IOHelper::append_empty(), HDF5IOHelper::create_dataset(), HDF5IOHelper::create_empty_dataset(), HDF5IOHelper::create_group(), SysCallApplicInterface::spawn_analysis_to_shell(), SysCallApplicInterface::spawn_evaluation_to_shell(), SysCallApplicInterface::spawn_input_filter_to_shell(), and SysCallApplicInterface::spawn_output_filter_to_shell().

**void Dakota::apply_matrix_partial ( const MatrixType & M, const VectorType & v1, VectorType & v2 )**

Applies a RealMatrix to a vector (or subset of vector) v1.

- Optionally works with a subset of the passed vectors; applies the matrix M to the first M.numCols() entries in v1, and populates the first M.numRows entries in v2.
- References abort_handler().
- Referenced by apply_linear_constraints(), DakotaROLIneqConstraintsHess::applyAdjointHessian(), DakotaROLEqConstraintsHess::applyAdjointHessian(), DakotaROLIneqConstraintsGrad::applyJacobian(), DakotaROLEqConstraintsGrad::applyJacobian(), and DakotaROLOrObjectives::applyHessVec().

**void Dakota::apply_matrix_transpose_partial ( const RealMatrix & M, const VectorType & v1, VectorType & v2 )**

Applies transpose of a RealMatrix to a vector (or subset of vector) v1.

- Optionally works with a subset of the passed vectors; applies the matrix $M^T$ to the first M.numRows() entries in v1, and populates the first M.numCols() entries in v2.
- References abort_handler().
- Referenced by DakotaROLIneqConstraintsGrad::applyAdjointJacobian(), and DakotaROLEqConstraintsGrad::applyAdjointJacobian().

**void abort_throw_or_exit ( int dakota_code )**

- Throws a Boost system_error or call std::exit, with (256 + dakota_code), where dakota_code < 0
- RATIONALE: Avoid common "standard" exit codes and signals (signum.h) as well as uncaught signals / uncatchable SIGKILL which return 128
  - Return a value in [0,255] since some operating systems only return the 8 least significant bits, leaves [193, 255] for Dakota. This should make return codes consistent cross-platform.
  - References abort_mode.
- Referenced by abort_handler(), and ParallelLibrary::abort_helper().

**void register_signal_handlers ( )**

Tie various signal handlers to Dakota’s abort_handler function.

- Global function to register signal handlers at top-level.
- References abort_handler().
- Referenced by main().
12.1. DAKOTA NAMESPACE REFERENCE

void mpi_debug_hold ( )

Global function to hold Dakota processes to help with MPI debugging.

    See details in code for details, depending on MPI implementation in use.

    Referenced by main().

T Dakota::abort_handler_t ( int code )

Templatized abort_handler_t method that allows for convenient return from methods that otherwise have no sensible return from error clauses. Usage: MyType& method() { return abort_handler<MyType&>(-1); }

    References abort_handler().

void svd ( RealMatrix & matrix, RealVector & singular_vals, RealMatrix & v_trans, bool compute_vectors = true )

Compute the SVD of an arbitrary matrix A = USV^T.

    Uses Teuchos::LAPACK.GESVD() to compute the singular value decomposition, overwriting A with the left singular vectors U (or destroying A if compute_vectors = false); optionally returns right singular vectors in v_trans.

    References abort_handler().

    Referenced by PebblBranchSub::candidateSolution(), NestedModel::cv_index_map(), NestedModel::cdiv_index_map(), NestedModel::cdsv_index_map(), ActiveSubspaceModel::compute_svd(), ActiveSubspaceModel::computeBingLiCriterion(), ActiveSubspaceModel::computeConstantineMetric(), Variables::continuous_variable_id(), Variables::continuous_variable_ids(), Variables::continuous_variable_label(), Variables::continuous_variable_labels(), Variables::continuous_variable_type(), Variables::continuous_variable_types(), SharedVariablesData::copy(), NestedModel::cv_index_map(), Model::discrete_int_sets(), Variables::discrete_int_variable_label(), Variables::discrete_int_variable_labels(), Variables::discrete_int_variable_type(), Variables::discrete_int_variable_types(), Variables::discrete_real_variable_label(), Variables::discrete_real_variable_labels(), Variables::discrete_real_variable_type(), Variables::discrete_real_variable_types(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Variables::discrete_string_variable_label(), Variables::discrete_string_variable_labels(), Variables::discrete_string_variable_type(), Variables::discrete_string_variable_types(), ParamStudy::distribute(), NestedModel::div_index_map(), NestedModel::drv_index_map(), NestedModel::dsv_index_map(), DataTransformModel::get_hyperparam_vc_index(), Variables::inactive_continuous_variable_id(), Variables::inactive_continuous_variable_labels(), Variables::inactive_continuous_variable_types(), Variables::inactive_discrete_int_variable_labels(), Variables::inactive_discrete_int_variable_types(), Variables::inactive_discrete_real_variable_labels(), Variables::inactive_discrete_real_variable_types(), Variables::inactive_discrete_string_variable_labels(), Variables::inactive_discrete_string_variable_types(), DataTransformModel::init_continuous_vars(), RecastModel::init_variables(), NonD::NonD(), Optimizer::Optimizer(), SensAnalysisGlobal::partial_corr(), ParamStudy::pre_run(), ProbabilityTransformModel::ProbabilityTransformModel(), Constraints::reshape(), NonD::resize(), singular_values(), NonD::size(), PebblBranchSub::splitComputation(), NonD::transform_model(), ReducedBasis::update_svd(), DataTransformModel::variables_expand(), RandomFieldModel::variables_resize(), AdaptedBasisModel::variables_resize(), and ActiveSubspaceModel::variables_resize().

int qr ( RealMatrix & A )

Compute an in-place QR factorization A = QR.

    Uses Teuchos::LAPACK.GEQRF() to compute the QR decomposition, overwriting A with the transformations and R.

    References abort_handler().

    Referenced by SensAnalysisGlobal::partial_corr().
int qr_rsolve ( const RealMatrix & q, r, bool transpose, RealMatrix & rhs )

Perform a multiple right-hand sides Rinv * rhs solve using the R from a qr factorization.

   Returns info > 0 if the matrix is singular
   Uses Teuchos::LAPACK.TRTRS() to perform a triangular backsolve
   References abort_handler().
   Referenced by SensAnalysisGlobal::partial_corr().

bool Dakota::operator!=( const ActiveSet & set1, const ActiveSet & set2 ) [inline]

inequality operator for ActiveSet

   inequality operator

bool Dakota::operator==( const Model & m1, const Model & m2 ) [inline]

equality operator for Envelope is true if same letter instance

   equality operator (detect same letter instance)
   References Model::modelRep.

bool Dakota::operator!=( const Model & m1, const Model & m2 ) [inline]

inequality operator for Envelope is true if different letter instance

   inequality operator (detect different letter instances)
   References Model::modelRep.

void Dakota::get_initial_values ( const Model & model, VecT & values )

Adapter for copying initial continuous variables values from a Dakota Model into TPL vectors

   References Model::continuous_variables(), and Model::cv().
   Referenced by ROLOptimizer::set_problem().

bool Dakota::get_bounds ( const RealVector & lower_source, const RealVector & upper_source, VecT & lower_target, VecT & upper_target, Real big_real_bound_size, Real no_value )

Adapter for copying continuous variables data from Dakota RealVector into TPL vectors

   References by get_linear_constraints(), get_variable_bounds(), and ROLOptimizer::set_problem().

void Dakota::get_bounds ( const Model & model, VecT & lower_target, VecT & upper_target )

Adapter for copying continuous variables data from a Dakota Model into TPL vectors

   References Model::continuous_lower_bounds(), and Model::continuous_upper_bounds().

void Dakota::get_bounds ( const SetT & source_set, VecT & lower_target, VecT & upper_target, int target_offset )

Adapter originating from (and somewhat specialized based on) APPSOptimizer for copying discrete variables from a set-based Dakota container into TPL vectors
12.1. DAKOTA NAMESPACE REFERENCE

bool Dakota::get_mixed_bounds ( const MaskType & mask_set, const SetArray & source_set, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> & lower_source, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> & upper_source, const VectorType2 & lower_target, const Teuchos::SerialDenseVector<OrdinalType, ScalarType> & bigBoundSize, ScalarType no_value, int target_offset = 0 )

Adapter originating from (and somewhat specialized based on) APPSOptimizer for copying discrete integer variables data with bit masking from Dakota into TPL vectors

Referenced by get_variable_bounds().

bool Dakota::get_variable_bounds ( Model & model, Real big_real_bound_size, int big_int_bound_size, typename AdapterT::VecT & lower, typename AdapterT::VecT & upper )

Adapter originating from (and somewhat specialized based on) APPSOptimizer for copying heterogeneous bounded data from Dakota::Variables into concatenated TPL vectors

References Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::cv(), Model::discrete_int_lower_bounds(), Model::discrete_int_sets(), Model::discrete_int_upper_bounds(), Model::discrete_real_lower_bounds(), Model::discrete_real_upper_bounds(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Model::discrete_set_string_values(), Model::div(), Model::drv(), get_bounds(), and get_mixed_bounds().

int Dakota::configure_inequality_constraint_maps ( const Model & model, Real big_real_bound_size, CONSTRAINT_TYPE ctype, IVecT & map_indices, RVecT & map_multipliers, RVecT & map_offsets, Real scaling = 1.0 )

Adapter for configuring inequality constraint maps used when transferring data between Dakota and a TPL

References Model::linear_ineq_constraint_lower_bounds(), Model::linear_ineq_constraint_upper_bounds(), Model::nonlinear_ineq_constraint_lower_bounds(), Model::nonlinear_ineq_constraint_upper_bounds(), Model::num_linear_ineq_constraints(), and Model::num_nonlinear_ineq_constraints().

Referenced by Optimizer::configure_constraint_maps().

void Dakota::configure_equality_constraint_maps ( Model & model, CONSTRAINT_TYPE ctype, IVecT & indices, size_t index_offset, RVecT & multipliers, RVecT & values, bool make_one_sided )

Adapter for configuring equality constraint maps used when transferring data between Dakota and a TPL

References Model::linear_eq_constraint_targets(), Model::nonlinear_eq_constraint_targets(), Model::num_linear_eq_constraints(), and Model::num_nonlinear_eq_constraints().

void Dakota::get_linear_constraints ( Model & model, Real big_real_bound_size, typename AdapterT::VecT & lin_ineq_lower_bnds, typename AdapterT::VecT & lin_ineq_upper_bnds, typename AdapterT::MatT & lin_ineq_coeffs, typename AdapterT::MatT & lin_eq_coeffs )

Adapter based initially on APPSOptimizer for linear constraint maps and including matrix and bounds data; bundles a few steps together which could (should?) be broken into two or more adapters

References copy_data(), get_bounds(), Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_targets(), Model::linear_ineq_constraint_coeffs(), Model::linear_ineq_constraint_lower_bounds(), and Model::linear_ineq_constraint_upper_bounds().
void Dakota::apply_linear_constraints ( const Model & model, CONSTRAINT_EQUALITY_TYPE etype, const VecT & in_vals, VecT & values, bool adjoint = false )

Data adapter to transfer data from Dakota to third-party opt packages. The vector values might contain additional constraints; the first entries corresponding to linear constraints are populated by apply.

References apply_matrix_partial(), Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_targets(), Model::linear_ineq_constraint_coeffs(), Model::num_linear_eq_constraints(), and Model::num_linear_ineq_constraints().

Referenced by DakotaROLIneqConstraints::value(), and DakotaROLEqConstraints::value().

void Dakota::apply_nonlinear_constraints ( const Model & model, CONSTRAINT_EQUALITY_TYPE etype, const VecT & in_vals, VecT & values, bool adjoint = false )

Data adapter to transfer data from Dakota to third-party opt packages

If adjoint = false, (perhaps counter-intuitively) apply the Jacobian (transpose of the gradient) to in_vals, which should be of size num_continuous_vars: J*x = G'*x, resulting in num_nonlinear_const values getting populated (possibly a subset of the total constraint vector).

If adjoint = true, apply the adjoint Jacobian (gradient) to the nonlinear constraint portion of in_vals, which should be of size at least num_nonlinear_consts: J'*y = G*y, resulting in num_continuous_vars values getting populated.

References Model::current_response(), Model::cv(), Response::function_gradients(), Model::num_linear_eq_constraints(), Model::num_linear_ineq_constraints(), Model::num_nonlinear_eq_constraints(), and Model::num_nonlinear_ineq_constraints().

Referenced by DakotaROLIneqConstraintsGrad::applyAdjointJacobian(), DakotaROLEqConstraintsGrad::applyAdjointJacobian(), DakotaROLIneqConstraintsGrad::applyJacobian(), and DakotaROLEqConstraintsGrad::applyJacobian().

void Dakota::set_best_responses ( typename AdapterT::OptT & optimizer, const Model & model, const std::vector<int> constraint_map_indices, const std::vector<double> constraint_map_multipliers, const std::vector<double> constraint_map_offsets, ResponseArray & response_array )

Data adapter for use by third-party opt packages to transfer response data to Dakota

References Model::num_nonlinear_eq_constraints(), Model::num_nonlinear_ineq_constraints(), Model::primary_response_fn_sense(), and Model::response_size().

void Dakota::set_variables ( const VectorType & source, Model & model, Variables & vars )

copy appropriate slices of source vector to Dakota::Variables

References Variables::continuous_variables(), copy_data(), copy_data_partial(), Variables::cv(), Model::discrete_int_sets(), Variables::discrete_int_variables(), Variables::discrete_real_variables(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Model::discrete_set_string_values(), Variables::discrete_string_variable(), Variables::div(), Variables::drv(), Variables::dsv(), and set_index_to_value().

void Dakota::get_variables ( Model & model, VectorType & vec )

copy the various pieces comprising Dakota::Variables into a concatenated TPL vector

References abort_handler(), Model::continuous_variables(), copy_data(), Model::cv(), Model::discrete_int_sets(), Model::discrete_int_variables(), Model::discrete_real_variables(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Model::discrete_set_string_values(), Model::discrete_string_variables(), Model::div(), Model::drv(), and Model::dsv().
void Dakota::get_responses ( const Model & model, const RealVector & dak_fn_vals, const std::vector<int> & constraint_map_indices, const std::vector<RealVector> & constraint_map_multipliers, const std::vector<double> & constraint_map_offsets, vectorType & f_vec, vectorType & cEqs_vec, vectorType & cIneqs_vec )

Data adapter to transfer data from Dakota to third-party opt packages

References Model::num_nonlinear_eq_constraints(), and Model::primary_response_fn_sense().

Referenced by Optimizer::get_responses_from_dakota().

void Dakota::get_nonlinear_eq_constraints ( const Model & model, VecT & values, Real scale, int offset = -1 )

Data adapter to transfer data from Dakota to third-party opt packages

References Model::current_response(), Response::function_values(), Model::nonlinear_eq_constraint_targets(), Model::num_linear_eq_constraints(), Model::num_nonlinear_eq_constraints(), and Model::num_nonlinear_ineq_constraints().

Referenced by DakotaROLEqConstraints::value().

void Dakota::get_nonlinear_eq_constraints ( Model & model, const RealVector & curr_resps_vals, VecT & values, Real scale, int offset = 0 )

Data adapter to transfer data from Dakota to third-party opt packages

References Model::nonlinear_eq_constraint_targets(), and Model::num_nonlinear_eq_constraints().

void Dakota::get_nonlinear_ineq_constraints ( const Model & model, VecT & values )

Data adapter to transfer data from Dakota to third-party opt packages

References copy_data_partial(), Model::current_response(), Response::function_values(), Model::num_linear_ineq_constraints(), and Model::num_nonlinear_ineq_constraints().

Referenced by DakotaROLIneqConstraints::value().

void Dakota::get_nonlinear_constraints ( Model & model, VecT & nonlin_ineq_lower, VecT & nonlin_ineq_upper, VecT & nonlin_eq_targets )

Would like to combine the previous adapter with this one (based on APPSOptimizer and COLINOptimizer) and then see how much more generalization is needed to support other TPLs like JEGA.

Data adapter to transfer data from Dakota to third-party opt packages

References copy_data(), Model::nonlinear_eq_constraint_targets(), Model::nonlinear_ineq_constraint_lower_bounds(), and Model::nonlinear_ineq_constraint_upper_bounds().

Referenced by COLINApplication::set_problem().

bool Dakota::operator!= ( const Response & resp1, const Response & resp2 ) [inline]

inequality operator for Response

inequality operator

bool Dakota::operator!= ( const Variables & vars1, const Variables & vars2 ) [inline]

inequality operator for Variables

strict inequality operator
void Dakota::write_ordered ( std::ostream & s, const SizetArray & comp_totals, const Teuchos::SerialDenseVector<OrdinalType, ScalarType1> & c_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType2> & di_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType3> & ds_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType4> & dr_vector ) [inline]

free function to write Variables data vectors in input spec ordering
written for arbitrary types, but typical use will be ScalarType1 = Real, ScalarType2 = int, ScalarType3 = string,
and ScalarType4 = int or Real.
References write_data.partial().
Referenced by ParamStudy::pre_run().

void Dakota::write_ordered ( std::ostream & s, const SizetArray & comp_totals, const Teuchos::SerialDenseVector<OrdinalType, ScalarType1> & c_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType2> & di_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType3> & ds_vector, const Teuchos::SerialDenseVector<OrdinalType, ScalarType4> & dr_vector ) [inline]

free function to write Variables data vectors in input spec ordering
written for arbitrary types, but typical use will be ScalarType1 = Real, ScalarType2 = int, ScalarType3 = string,
and ScalarType4 = int or Real.
References write_data.partial().

void copy_field_data ( const RealVector & fn_vals, RealMatrix & fn_grad, const RealSymMatrixArray & fn_hess, size_t offset, size_t num_fns, Response & response )

This assumes the source gradient/Hessian are size less or equal to the destination response, and that the leading
part is to be populated.
References Response::active_set_request_vector(), Response::function_gradient_view(), Response::function_hessian_view(), and Response::function_value().
Referenced by ExperimentData::scale_residuals().

void Dakota::copy_field_data ( const RealVector & fn_vals, RealMatrix & fn_grad, const RealSymMatrixArray & fn_hess, size_t offset, size_t num_fns, short total_asv, Response & response )

This assumes the source gradient/Hessian are size less or equal to the destination response, and that the leading
part is to be populated.
References Response::function_gradient_view(), Response::function_hessian_view(), and Response::function_value().

void symmetric_eigenvalue_decomposition ( const RealSymMatrix & matrix, RealVector & eigenvalues, RealMatrix & eigenvectors )

Computes the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A.
Eigenvalues are returned in ascending order.
References symmetric_eigenvalue_decomposition().
Referenced by NonDBayesCalibration::get_positive_definite_covariance_from_hessian(), and symmetric_eigenvalue_decomposition().

Real Dakota::getdist ( const RealVector & x1, const RealVector & x2 )

Gets the Euclidean distance between x1 and x2.
Referenced by mindist(), and mindistindx().

Real Dakota::mindist ( const RealVector & x, const RealMatrix & xset, int except )

Returns the minimum distance between the point x and the points in the set xset (compares against all points in xset except point "except"): if except is not needed, pass 0.
  References getdist().
  Referenced by getRmax().

Real Dakota::mindistindx ( const RealVector & x, const RealMatrix & xset, const IntArray & indx )

Gets the min distance between x and points in the set xset defined by the nindx values in indx.
  References getdist().
  Referenced by GaussProcApproximation::pointsel_add_sel().

Real Dakota::getRmax ( const RealMatrix & xset )

Gets the maximum of the min distance between each point and the rest of the set.
  References mindist().
  Referenced by GaussProcApproximation::pointsel_add_sel().

int Dakota::start_grid_computing ( char * analysis_driver_script, char * params_file, char * results_file )

sample function prototype for launching grid computing

int Dakota::stop_grid_computing ( )

sample function prototype for terminating grid computing

int Dakota::perform_analysis ( char * iteration_num )

sample function prototype for submitting a grid evaluation

string Dakota::asstring ( const T & val )

Creates a string from the argument val using an ostringstream.
  This only gets used in this file and is only ever called with ints so no error checking is in place.
Parameters

| val | The value of type T to convert to a string. |

Returns

  The string representation of val created using an ostringstream.
  Referenced by JEGAOptimizer::LoadTheConstraints().

void start_dakota_heartbeat ( int seconds )

Heartbeat function provided by dakota_filesistem_utils; pass output interval in seconds, or -1 to use SDAKOTA_HEARTBEAT
  Referenced by OutputManager::OutputManager().
bool Dakota::operator==( const ParamResponsePair & pair1, const ParamResponsePair & pair2 )
[inline]
equality operator for ParamResponsePair

equality operator

References ParamResponsePair::evalInterfaceIds, ParamResponsePair::prpResponse, and ParamResponsePair::prpVariables.

bool Dakota::operator!=( const ParamResponsePair & pair1, const ParamResponsePair & pair2 )
[inline]
iequality operator for ParamResponsePair

equality operator

bool Dakota::set_compare ( const ParamResponsePair & database_pr, const ActiveSet & search_set )
[inline]

search function for a particular ParamResponsePair within a PRPList based on ActiveSet content (request vector and derivative variables vector)

a global function to compare the ActiveSet of a particular database_pr (presumed to be in the global history list) with a passed in ActiveSet (search_set).

References ParamResponsePair::active_set(), ActiveSet::derivative_vector(), and ActiveSet::request_vector().

Referenced by lookup_by_val().

bool Dakota::id_vars_exact_compare ( const ParamResponsePair & database_pr, const ParamResponsePair & search_pr ) [inline]

search function for a particular ParamResponsePair within a PRPMultiIndex

a global function to compare the interface id and variables of a particular database_pr (presumed to be in the global history list) with a passed in key of interface id and variables provided by search_pr.

References ParamResponsePair::interface_id(), and ParamResponsePair::variables().

Referenced by partial_prp_equality::operator().

PRPCacheHIter Dakota::lookup_by_val ( PRPMultiIndexCache & prp_cache, const ParamResponsePair & search_pr ) [inline]

find a ParamResponsePair based on the interface id, variables, and ActiveSet search data within search_pr.

Lookup occurs in two steps: (1) PRPMultiIndexCache lookup based on strict equality in interface id and variables, and (2) set_compare() post-processing based on ActiveSet subset logic.

References ParamResponsePair::active_set(), and set_compare().

Referenced by NonDDREAMBayesCalibration::archive_acceptance_chain(), Minimizer::archive_best_results(), DataTransformModel::archive_submodel_responses(), NonDQUESTOBayesCalibration::cache_chain(), Model::db_lookup(), ApplicationInterface::duplication_detect(), SurrBasedLocalMinimizer::find_response(), Minimizer::local_recast_retrieve(), lookup_by_val(), SurrBasedMinimizer::print_results(), LeastSq::print_results(), Optimizer::print_results(), DiscrepancyCorrection::search_db(), and NonDLocalReliability::update_mpp_search_data().

PRPQueueHIter Dakota::lookup_by_val ( PRPMultiIndexQueue & prp_queue, const ParamResponsePair & search_pr ) [inline]

find a ParamResponsePair based on the interface id, variables, and ActiveSet search data within search_pr.
Lookup occurs in two steps: (1) PRPMultiIndexQueue lookup based on strict equality in interface id and
variables, and (2) set compare() post-processing based on ActiveSet subset logic.
References ParamResponsePair::active set(), and set compare().

```c
void print_restart ( StringArray pos_args, String print_dest )
```
print a restart file
Usage: “dakota_restart_util print dakota.rst”
“dakota_restart_util to_neutral dakota.rst dakota.neu”
Prints all evals. in full precision to either stdout or a neutral file. The former is useful for ensuring that
duplicate detection is successful in a restarted run (e.g., starting a new method from the previous best), and the
latter is used for translating binary files between platforms.
References abort_handler(), ParamResponsePair::eval_id(), ParamResponsePair::write_annotated(), and write-
_precision.
Referenced by main().

```c
void print_restart_pdb ( StringArray pos_args, String print_dest )
```
print a restart file (PDB format)
Usage: “dakota_restart_util to_pdb dakota.rst dakota.pdb”
Unrolls all data associated with a particular tag for all evaluations and then writes this data in a tabular format
(e.g., to a PDB database or MATLAB/TECPLOT data file).
References abort_handler(), Variables::continuous_variables(), Variables::discrete_int_variables(), Variables-
::discrete_real_variables(), and Response::function_values().
Referenced by main().

```c
void print_restart_tabular ( StringArray pos_args, String print_dest, unsigned short tabular_format, int tabular_precision )
```
print a restart file (tabular format)
Usage: “dakota_restart_util to_tabular dakota.rst dakota.txt”
Unrolls all data associated with a particular tag for all evaluations and then writes this data in a tabular format
(e.g., to a PDB database or MATLAB/TECPLOT data file).
References abort_handler(), Variables::acv(), Variables::adiv(), Variables::adrv(), Variables::adsv(), Variables-
::all_continuous_variable_labels(), Variables::all_discrete_int_variable_labels(), Variables::all_discrete_real_variable-
_labels(), Variables::all_discrete_string_variable_labels(), Response::function_labels(), ParamResponsePair::interface-
_id(), ParamResponsePair::response(), ParamResponsePair::variables(), write_precision, ParamResponsePair::write-
_tabular(), and ParamResponsePair::write_tabular_labels().
Referenced by main().

```c
void read_neutral ( StringArray pos_args )
```
read a restart file (neutral file format)
Usage: “dakota_restart_util from_neutral dakota.neu dakota.rst”
Reads evaluations from a neutral file. This is used for translating binary files between platforms.
References abort_handler(), and ParamResponsePair::read_annotated().
Referenced by main().
void repair_restart ( StringArray pos_args, String identifier_type )

repair a restart file by removing corrupted evaluations
Usage: "dakota_restart_util remove 0.0 dakota_old.rst dakota_new.rst"
"dakota_restart_util remove_ids 2 7 13 dakota_old.rst dakota_new.rst"
Repairs a restart file by removing corrupted evaluations. The identifier for evaluation removal can be either
a double precision number (all evaluations having a matching response function value are removed) or a list of
integers (all evaluations with matching evaluation ids are removed).
References abort_handler(). Response::active_set_request_vector(), contains(), ParamResponsePair::eval_id(),
Response::function_values(), and ParamResponsePair::response().
Referenced by main().

void concatenate_restart ( StringArray pos_args )
concatenate multiple restart files
Usage: "dakota_restart_util cat dakota_1.rst ... dakota_n.rst dakota_new.rst"
Combines multiple restart files into a single restart database.
References abort_handler().
Referenced by main().

std::vector<std::string> Dakota::get_pathext ( )
Utility function for executable file search algorithms
Referenced by WorkdirHelper::which().

bool Dakota::contains ( const bfs::path & dir_path, const std::string & file_name, boost::filesystem::path & complete_filepath ) [inline]
Utility function for "which" sets complete_filepath from dir_path/file_name combo

12.1.5 Variable Documentation

short abort_mode = ABORT_EXITs
by default Dakota exits or calls MPL_Abort on errors
whether dakota exits/aborts or throws on errors
Referenced by abort_throw_or_exit(), Environment::exit_mode(), and PythonInterface::python_run().

UShortStrBimap submethod_map [static]
Initial value:

= boost::assign::list_of<UShortStrBimap::relation>
  (HYBRID, "hybrid")
  (SUBMETHOD_COLLABORATIVE, "collaborative")
  (SUBMETHOD_EMBEDDED, "embedded")
  (SUBMETHOD_SEQUENTIAL, "sequential")
  (SUBMETHOD_LHS, "lhs")
  (SUBMETHOD_RANDOM, "random")
  (SUBMETHOD_BOX_BEHENKEN, "box_behenken")
  (SUBMETHOD_CENTRAL_COMPOSITE, "central_composite")
  (SUBMETHOD_GRID, "grid")
  (SUBMETHOD_OA_LHS, "oa_lhs")
  (SUBMETHOD_OAS, "oas")
  (SUBMETHOD_DREAM, "dream")
bimap between sub-method enums and strings; only used in this compilation unit (using bimap for consistency, though at time of addition, only uni-directional mapping is supported)

Referenced by Iterator::submethod_enum_to_string().

**Dakota_funcs DakFuncs0**

Referenced by ScilabInterface::scilab_engine_run().

12.2 SIM Namespace Reference

A sample namespace for derived classes that use assign_rep() to plug facilities into DAKOTA.
Classes

- class ParallelDirectApplicInterface
  Sample derived interface class for testing parallel simulator plug-ins using assign\_rep().
- class SerialDirectApplicInterface
  Sample derived interface class for testing serial simulator plug-ins using assign\_rep().

12.2.1 Detailed Description

A sample namespace for derived classes that use assign\_rep() to plug facilities into DAKOTA. A typical use of plug-ins with assign\_rep() is to publish a simulation interface for use in library mode See Interfacing with Dakota as a Library for more information.
Chapter 13

Class Documentation

13.1 ActiveSet Class Reference

Container class for active set tracking information. Contains the active set request vector and the derivative variables vector.

Public Member Functions

- **ActiveSet ()**
  
  *default constructor*

- **ActiveSet (size_t num_fns, size_t num_deriv_vars)**
  
  *standard constructor*

- **ActiveSet (size_t num_fns)**
  
  *partial constructor*

- **ActiveSet (const ShortArray &asv, const SizetArray &dvv)**
  
  *alt constructor*

- **ActiveSet (const ActiveSet &set)**
  
  *copy constructor*

- **~ActiveSet ()**
  
  *destructor*

- **ActiveSet & operator= (const ActiveSet &set)**
  
  *assignment operator*

- **void reshape (size_t num_fns, size_t num_deriv_vars)**
  
  *reshape requestVector and derivVarsVector*

- **void reshape (size_t num_fns)**
  
  *reshape requestVector*

- **const ShortArray & request_vector () const**
  
  *return the request vector*

- **void request_vector (const ShortArray &rv)**
  
  *set the request vector*

- **void request_values (const short rv_val)**
  
  *set all request vector values*
• short request_value (const size_t index) const
  get the value of an entry in the request vector
• void request_value (const short rv_val, const size_t index)
  set the value of an entry in the request vector
• const SizetArray & derivative_vector () const
  return the derivative variables vector
• void derivative_vector (const SizetArray &dvv)
  set the derivative variables vector from a SizetArray
• void derivative_vector (SizetMultiArrayConstView dvv)
  set the derivative variables vector from a SizetMultiArrayConstView
• void derivative_start_value (size_t dvv_start_val)
  set the derivative variables vector values
• void read (std::istream &s)
  read an active set object from an std::istream
• void write (std::ostream &s) const
  write an active set object to an std::ostream
• void write_annotated (std::ostream &s) const
  write an active set object to an std::ostream in annotated format
• void read (MPIUnpackBuffer &s)
  read an active set object from a packed MPI buffer
• void write (MPIPackBuffer &s) const
  write an active set object to a packed MPI buffer

Private Member Functions

• template<class Archive >
  void serialize (Archive &ar, const unsigned int version)
  implementation of Boost serialize for ActiveSet

Private Attributes

• ShortArray requestVector
  the vector of response requests
• SizetArray derivVarsVector
  the vector of variable ids used for computing derivatives

Friends

• class boost::serialization::access
• bool operator== (const ActiveSet &set1, const ActiveSet &set2)
  equality operator
• bool operator!= (const ActiveSet &set1, const ActiveSet &set2)
  inequality operator
13.1.1 Detailed Description

Container class for active set tracking information. Contains the active set request vector and the derivative variables vector.

The ActiveSet class is a small class whose initial design function is to avoid having to pass the ASV and D-VV separately. It is not part of a class hierarchy and does not employ reference-counting/ representation-sharing idioms (e.g., handle-body).

13.1.2 Member Data Documentation

**ShortArray requestVector [private]**

the vector of response requests

It uses a 0 value for inactive functions and sums 1 (value), 2 (gradient), and 4 (Hessian) for active functions.

Referenced by ActiveSet::ActiveSet(), ActiveSet::operator=(), ActiveSet::read(), ActiveSet::request_value(), ActiveSet::request_values(), ActiveSet::request_vector(), ActiveSet::reshape(), ActiveSet::write(), and ActiveSet::write.annotated().

**SizetArray derivVarsVector [private]**

the vector of variable ids used for computing derivatives

These ids will generally identify either the active continuous variables or the inactive continuous variables.

Referenced by ActiveSet::ActiveSet(), ActiveSet::derivative_start_value(), ActiveSet::derivative_vector(), ActiveSet::operator=(), ActiveSet::read(), ActiveSet::reshape(), ActiveSet::write(), and ActiveSet::write.annotated().

The documentation for this class was generated from the following file:

- DakotaActiveSet.hpp

13.2 ActiveSubspaceModel Class Reference

Active subspace model for input (variable space) reduction.

**Public Member Functions**

- **ActiveSubspaceModel (ProblemDescDB &problem_db)**
  
  *Problem database constructor.*

- **ActiveSubspaceModel (const Model &sub_model, unsigned int dimension, const RealMatrix &rotation_matrix, short output_level)**
  
  *Lightweight constructor*

- **~ActiveSubspaceModel ()**
CHAPTER 13. CLASS DOCUMENTATION

### Destructor
- `bool initialize_mapping (ParLevLIter pl_iter)`
- `bool finalize_mapping ()`
  finalize model mapping, returns true if the variables size has changed
- `bool mapping_initialized () const`
  return true if mapping has been fully initialized, false otherwise.
- `bool resize_pending () const`
  return true if a potential resize is still pending, such that sizing-based initialization should be deferred
- `void stop_init_mapping (ParLevLIter pl_iter)`
  called from IteratorScheduler::init_iterator() for iteratorComm rank 0 to terminate serve_init_mapping() on other iteratorComm processors
- `int serve_init_mapping (ParLevLIter pl_iter)`
  called from IteratorScheduler::init_iterator() for iteratorComm rank != 0 to balance resize() calls on iteratorComm rank 0

### Protected Member Functions
- `void derived_init_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag)`
  portion of set_communicators() specific to derived model classes
- `void derived_set_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag)`
  portion of set_communicators() specific to derived model classes
- `void derived_free_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag)`
  portion of free_communicators() specific to derived model classes
- `void derived_evaluate (const ActiveSet &set)`
  portion of evaluate() specific to derived model classes
- `void derived_evaluate_nowait (const ActiveSet &set)`
  portion of evaluate_nowait() specific to derived model classes
- `const IntResponseMap & derived_synchronize ()`
  portion of synchronize() specific to derived model classes
- `const IntResponseMap & derived_synchronize_nowait ()`
  portion of synchronize_nowait() specific to derived model classes
- `void component_parallel_mode (short mode)`
  update component parallel mode for supporting parallelism in the offline and online phases
- `void serve_run (ParLevLIter pl_iter, int max_eval_concurrency)`
  Service the offline and online phase job requests received from the master; completes when termination message received from stop_servers().
- `void stop_servers ()`
  Executed by the master to terminate the offline and online phase server operations when iteration on the Active-SubspaceModel is complete.
- `Model get_sub_model (ProblemDescDB &problem_db)`
  retrieve the sub-Model from the DB to pass up the constructor chain
- `void init_fullspace_sampler (unsigned short sample_type)`
  initialize the native problem space Monte Carlo sampler
- `void validate_inputs ()`
  validate the build controls and set defaults
• **void build_subspace ()**
  sample the model’s gradient, computed the SVD, and form the active subspace rotation matrix.

• **void generate_fullspace_samples** (unsigned int diff_samples)
  sample the derivative at diff_samples points and leave temporary in dace_iterator

• **void populate_matrices** (unsigned int diff_samples)
  populate the derivative and vars matrices with fullspaceSampler samples

• **void compute_svd ()**
  factor the derivative matrix and analyze singular values, assessing convergence and rank, returning whether tolerance met

• **void identify_subspace ()**
  use the truncation methods to identify the size of an active subspace

• unsigned int **computeBingLiCriterion** (RealVector &singular_values)
  compute Bing Li’s criterion to identify the active subspace

• unsigned int **computeConstantineMetric** (RealVector &singular_values)
  compute Constantine’s metric to identify the active subspace

• unsigned int **computeEnergyCriterion** (RealVector &singular_values)
  Compute active subspace size based on eigenvalue energy. Compatible with other truncation methods.

• unsigned int **computeCrossValidationMetric ()**
  Use cross validation of a moving least squares surrogate to identify the size of an active subspace that meets an error tolerance.

• Real **build_cv_surrogate** (Model &cv_surr_model, RealMatrix training_x, IntResponseMap training_y, RealMatrix test_x, IntResponseMap test_y)
  Build moving least squares surrogate over candidate active subspace.

• unsigned int **determine_rank_cv** (const std::vector< Real > &cv_error)

• unsigned int **min_index** (const std::vector< Real > &cv_error)

• unsigned int **tolerance_met_index** (const std::vector< Real > &cv_error, Real tolerance, bool &tol_met)

• std::vector< Real > **negative_diff** (const std::vector< Real > &cv_error)

• **void build_surrogate ()**
  Build surrogate over active subspace.

• **void initialize_recast ()**
  Initialize the base class RecastModel with reduced space variable sizes.

• SizetArray **variables_resize ()**
  Create a variables components totals array with the reduced space size for continuous variables.

• **void uncertain_vars_to_subspace ()**
  translate the characterization of uncertain variables in the native model to the reduced space of the transformed model

• **void update_linear_constraints ()**
  transform the original bounded domain (and any existing linear constraints) into linear constraints in the reduced space

• **void update_var_labels ()**
  update variable labels
Static Protected Member Functions

- static void vars_mapping (const Variables &recast_xi_vars, Variables &sub_model_x_vars)
  map the active continuous recast variables to the active submodel variables (linear transformation)
- static void set_mapping (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)
  map the inbound ActiveSet to the sub-model (map derivative variables)
- static void response_mapping (const Variables &recast_y_vars, const Variables &sub_model_x_vars, const Response &sub_model_resp, Response &recast_resp)
  map responses from the sub-model to the recast model

Protected Attributes

- int randomSeed
  seed controlling all samplers
- int initialSamples
  initial number of samples at which to query the truth model
- int maxFunctionEvals
  maximum number of build evaluations
- bool subspaceIdBingLi
  Boolean flag signaling use of Bing Li criterion to identify active subspace dimension.
- bool subspaceIdConstantine
  Boolean flag signaling use of Constantine criterion to identify active subspace dimension.
- bool subspaceIdEnergy
  Boolean flag signaling use of eigenvalue energy criterion to identify active subspace dimension.
- bool subspaceIdCV
  Boolean flag signaling use of cross validation to identify active subspace dimension.
- size_t numReplicates
  Number of bootstrap samples for subspace identification.
- bool transformVars
  boolean flag to determine if variables should be transformed to u-space before active subspace initialization
- size_t numFullspaceVars
  Number of fullspace active continuous variables.
- unsigned int totalSamples
  total construction samples evaluated so far
- bool subspaceInitialized
  boolean flag to determine if mapping has been fully initialized
- unsigned short subspaceNormalization
  Normalization to use in the case of multiple QoI’s.
- unsigned int reducedRank
  current approximation of system rank
- RealMatrix activeBasis
  basis for the reduced subspace
- RealMatrix inactiveBasis
13.2. ACTIVESUBSPACEMODEL CLASS REFERENCE

- RealVector inactiveVars
  current inactive variables
- RealMatrix derivativeMatrix
  matrix of derivative data with numFns columns per fullspace sample; each column contains the gradient of one function at one sample point, so total matrix size is numContinuousVars * (numFns * numSamples) 

  \[
  \begin{bmatrix}
  D1 | D2 | ... | Dnum_samples |
  dy1/dx(k=1) | dy2/dx(k=1) | ... | dyM/dx(k=1) | k=2 | ... | k=n_s
  \end{bmatrix}
  \]

- RealMatrix leftSingularVectors
  matrix of the left singular vectors of derivativeMatrix
- RealVector singularValues
  singular values of derivativeMatrix
- RealMatrix varsMatrix
  matrix of fullspace variable points samples size numContinuousVars * (numSamples)
- RealArray gradientScaleFactors
  Gradient scaling factors to make multiple response function gradients similar orders of magnitude.
- Real truncationTolerance
  Truncation tolerance for eigenvalue energy subspace identification.
- bool cvIncremental
- short cvIdMethod
- Real cvRelTolerance
- Real cvDecreaseTolerance
- unsigned int cvMaxRank
  maximum subspace size to consider using cross validation
- Model surrogateModel
  model containing a surrogate built over the active subspace
- bool buildSurrogate
  flag specifying whether or not a surrogate is built over the subspace
- int refinementSamples
  Number of refinement samples to use when building a surrogate.
- Iterator fullspaceSampler
  Monte Carlo sampler for the full parameter space.
- size_t miPLIndex
  the index of the active metaiterator-iterator parallelism level (corresponding to ParallelConfiguration::miPLIters) used at runtime
- int onlineEvalConcurrency
  Concurrency to use once subspace has been built.
- int offlineEvalConcurrency
  Concurrency to use when building subspace.
- IntResponseMap surrResponseMap
  map of responses returned in buildSurrogate mode
- IntIntMap surrIdMap
  map from surrogateModel evaluation ids to RecastModel ids
Static Protected Attributes

- static ActiveSubspaceModel * asmInstance
  static pointer to this class for use in static callbacks

Additional Inherited Members

13.2.1 Detailed Description

Active subspace model for input (variable space) reduction.
Specialization of a RecastModel that identifies an active subspace during build phase and creates a RecastModel in the reduced space

13.2.2 Constructor & Destructor Documentation

ActiveSubspaceModel ( const Model & sub_model, unsigned int dimension, const RealMatrix & rotation_matrix, short output_level )
lightweight constructor

An ActiveSubspaceModel will be built over all functions, without differentiating primary vs. secondary constraints. However the associated RecastModel has to differentiate. Currently identifies subspace for continuous variables only, but carries other active variables along for the ride.

References ActiveSubspaceModel::activeBasis, ActiveSubspaceModel::build_surrogate(), ActiveSubspaceModel::buildSurrogate, Model::componentParallelMode, Model::derivative_concurrency(), ActiveSubspaceModel::inactiveBasis, ActiveSubspaceModel::initialize_recast(), ActiveSubspaceModel::initialSamples, Model::modelId, Model::modelType, ActiveSubspaceModel::numFullspaceVars, ActiveSubspaceModel::offlineEvalConcurrency, ActiveSubspaceModel::onlineEvalConcurrency, Model::output_level(), Model::outputLevel, RecastModel::recast_model_id(), ActiveSubspaceModel::reducedRank, RecastModel::root_model_id(), RecastModel::subModel, ActiveSubspaceModel::subspaceInitialized, Model::supportsEstimDerivs, ActiveSubspaceModel::uncertain_vars_to_subspace(), ActiveSubspaceModel::update_linear_constraints(), and ActiveSubspaceModel::update_var_labels().

13.2.3 Member Function Documentation

bool initialize_mapping ( ParLevLIter pl_iter ) [virtual]

May eventually take on init_comms and related operations. Also may want ide of build/update like DataFitSurrModel, eventually.

Reimplemented from Model.

References ActiveSubspaceModel::build_subspace(), ActiveSubspaceModel::build_surrogate(), ActiveSubspaceModel::buildSurrogate, ActiveSubspaceModel::component_parallel_mode(), RecastModel::initialize_mapping(), Model::initialize_mapping(), ActiveSubspaceModel::initialize_recast(), ActiveSubspaceModel::miPLIndex, Model::modelPCIter, ActiveSubspaceModel::numFullspaceVars, Model::outputLevel, ActiveSubspaceModel::reducedRank, RecastModel::subModel, ActiveSubspaceModel::subspaceInitialized, Model::supportsEstimDerivs, ActiveSubspaceModel::uncertain_vars_to_subspace(), ActiveSubspaceModel::update_linear_constraints(), and ActiveSubspaceModel::update_var_labels().

void derived_init_communicators ( ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag ) [protected], [virtual]

This specialization is because the model is used in multiple contexts in this iterator, depending on build phase. Note that this overrides the default behavior at Iterator which recurses into any submodels.
Reimplemented from Model.
References ActiveSubspaceModel::fullspaceSampler, Iterator::init_communicators(), Model::init_communicators(),
ActiveSubspaceModel::onlineEvalConcurrency, RecastModel::subModel, and ActiveSubspaceModel::subspace-Initialized.

Real build_cv_surrogate ( Model & cv_surr_model, RealMatrix training_x, IntResponseMap training_y,
RealMatrix test_x, IntResponseMap test_y ) [protected]

Build moving least squares surrogate over candidate active subspace.
Build global moving least squares surrogate model to use in cross validation to estimate active subspace size.
References Response::active_set(), Model::continuous_variables(), Response::copy(), Model::current_response(),
Model::evaluate(), Model::numFns, and Model::update_approximation().
Referenced by ActiveSubspaceModel::computeCrossValidationMetric().

void build_surrogate ( ) [protected]
Build surrogate over active subspace.
Build surrogate over active subspace
References Response::active_set(), Iterator::active_set_request_values(), ActiveSubspaceModel::activeBasis,
Iterator::all_responses(), Iterator::all_samples(), Model::append_approximation(), ActiveSubspaceModel::asmInstance,
Model::assign_rep(), Model::current_response(), ActiveSubspaceModel::fullspaceSampler, ActiveSubspaceModel::::miPLIndex,
Model::modelPCIter, Model::outputLevel, ActiveSubspaceModel::reducedRank, ActiveSubspaceModel::::refinementSamples,
Iterator::run(), Iterator::sampling_reference(), Iterator::sampling_reset(), and ActiveSubspaceModel::::surrogateModel.
Referenced by ActiveSubspaceModel::::ActiveSubspaceModel(), and ActiveSubspaceModel::::initialize_mapping().

void initialize_recast ( ) [protected]
Initialize the base class RecastModel with reduced space variable sizes.
Initialize the recast model based on the reduced space, with no response function mapping (for now). TODO:
use a surrogate model over the inactive dimension.
References Model::current_response(), Model::cv(), Model::div(), Model::drv(), Model::dsv(), Response::function_gradients(),
Response::function_hessians(), RecastModel::init_maps(), RecastModel::init_sizes(), Model::num_-nonlinear_ineq_constraints(), Model::num_primary_fns(), Model::num_secondary_fns(), Model::numFns, ActiveSubspaceModel::reducedRank, ActiveSubspaceModel::response_mapping(), ActiveSubspaceModel::set_mapping(),
RecastModel::subModel, ActiveSubspaceModel::variables_resize(), and ActiveSubspaceModel::vars_mapping().
Referenced by ActiveSubspaceModel::::ActiveSubspaceModel(), and ActiveSubspaceModel::::initialize_mapping().

void uncertain_vars_to_subspace ( ) [protected]
translate the characterization of uncertain variables in the native_model to the reduced space of the transformed model
transform and set the distribution parameters in the reduced model
Convert the user-specified normal random variables to the appropriate reduced space variables, based on the orthogonal transformation.
TODO: Generalize to convert other random variable types (non-normal)
TODO: The translation of the correlations from full to reduced space is likely wrong for rank correlations;
s Should be correct for covariance.
Referenced by ActiveSubspaceModel::::ActiveSubspaceModel(), and ActiveSubspaceModel::::initialize_mapping().
void vars_mapping ( const Variables & recast_y_vars, Variables & sub_model_x_vars ) [static], [protected]
map the active continuous recast variables to the active submodel variables (linear transformation)
Perform the variables mapping from recast reduced dimension variables y to original model x variables via linear transformation. Maps only continuous variables.
References ActiveSubspaceModel::activeBasis, ActiveSubspaceModel::asmInstance, Variables::continuous_variables(), Dakota::copy_data(), ActiveSubspaceModel::inactiveBasis, ActiveSubspaceModel::inactiveVars, and Model::outputLevel.
Referenced by ActiveSubspaceModel::initialize_recast().

void set_mapping ( const Variables & recast_vars, const ActiveSet & recast_set, ActiveSet & sub_model_set ) [static], [protected]
map the inbound ActiveSet to the sub-model (map derivative variables)
Simplified derivative variables mapping where all continuous depend on all others. TODO: Could instead rely on a richer default in RecastModel based on varsMapIndices.
References ActiveSubspaceModel::asmInstance, Variables::cv(), Model::cv(), ActiveSet::derivative_vector(), and RecastModel::subModel.
Referenced by ActiveSubspaceModel::initialize_recast().

void response_mapping ( const Variables & recast_y_vars, const Variables & sub_model_x_vars, const Response & sub_model_resp, Response & recast_resp ) [static], [protected]
map responses from the sub-model to the recast model
Perform the response mapping from submodel to recast response
References ActiveSubspaceModel::activeBasis, ActiveSubspaceModel::asmInstance, Response::function_gradients(), Response::function_hessians(), and Response::function_values().
Referenced by ActiveSubspaceModel::initialize_recast().

13.2.4 Member Data Documentation
ActiveSubspaceModel * asmInstance [static], [protected]
static pointer to this class for use in static callbacks
initialization of static needed by RecastModel
Referenced by ActiveSubspaceModel::ActiveSubspaceModel(), ActiveSubspaceModel::build_surrogate(), ActiveSubspaceModel::response_mapping(), ActiveSubspaceModel::set_mapping(), and ActiveSubspaceModel::vars_mapping().
The documentation for this class was generated from the following files:
- ActiveSubspaceModel.hpp
- ActiveSubspaceModel.cpp

13.3 AdaptedBasisModel Class Reference
Adapted basis model for input (variable space) reduction.
Inheritance diagram for AdaptedBasisModel:
13.3. ADAPTEDBASISMODEL CLASS REFERENCE

Public Member Functions

- **AdaptedBasisModel** (ProblemDescDB &problem_db)
  - *Problem database constructor.*
- **~AdaptedBasisModel ()**
  - *Destructor.*
- **bool initialize_mapping** (ParLevLIter pl_iter)
  - *Initialize model mapping, returns true if the variables size has changed.*
- **bool finalize_mapping ()**
  - *Finalize model mapping, returns true if the variables size has changed.*
- **bool mapping_initialized () const**
  - *Return true if mapping has been fully initialized, false otherwise.*
- **bool resize_pending () const**
  - *Return true if a potential resize is still pending, such that sizing-based initialization should be deferred.*
- **void stop_init_mapping** (ParLevLIter pl_iter)
  - *Called from IteratorScheduler::init_iterator() for iteratorComm rank 0 to terminate serve_init_mapping() on other iteratorComm processors.*
- **int serve_init_mapping** (ParLevLIter pl_iter)
  - *Called from IteratorScheduler::init_iterator() for iteratorComm rank != 0 to balance resize() calls on iteratorComm rank 0.*

Protected Member Functions

- **void derived_init_communicators** (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag)
- **void derived_set_communicators** (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag)
  - *Portion of set_communicators() specific to derived model classes.*

  - *Portion of evaluate() specific to derived model classes.*
- **void derived_evaluate_nowait** (const ActiveSet &set)
  - *Portion of evaluate_nowait() specific to derived model classes.*
- **const IntResponseMap & derived_synchronize ()**
  - *Portion of synchronize() specific to derived model classes.*
- **const IntResponseMap & derived_synchronize_nowait ()**
  - *Portion of synchronize_nowait() specific to derived model classes.*
• void component_parallel_mode (short mode)
  update component parallel mode for supporting parallelism in the offline and online phases
• void serve_run (ParLevIter pl_iter, int max_eval_concurrency)
  Service the offline and online phase job requests received from the master; completes when termination message received from stop_servers().
• void stop_servers ()
  Executed by the master to terminate the offline and online phase server operations when iteration on the Adapted-BasisModel is complete.
• Model get_sub_model (ProblemDescDB &problem_db)
  retrieve the sub-Model from the DB to pass up the constructor chain
• void validate_inputs ()
  validate the build controls and set defaults
• void identify_subspace ()
• void initialize_recast ()
  Initialize the base class RecastModel with reduced space variable sizes.
• SizetArray variables_resize ()
  Create a variables components totals array with the reduced space size for continuous variables.
• void uncertain_vars_to_subspace ()
  translate the characterization of uncertain variables in the native_model to the reduced space of the transformed model

Static Protected Member Functions
• static void vars_mapping (const Variables &recast_xi_vars, Variables &sub_model_x_vars)
  map the active continuous recast variables to the active submodel variables (linear transformation)
• static void set_mapping (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)
  map the inbound ActiveSet to the sub-model (map derivative variables)
• static void response_mapping (const Variables &recast_y_vars, const Variables &sub_model_x_vars, const Response &sub_model_resp, Response &recast_resp)
  map responses from the sub-model to the recast model

Protected Attributes
• Iterator * pcePilotExpRepPtr
  PCE representation pointer that is initialized in get_sub_model() and then assigned into pcePilotExpansion in the constructor initializer list.
• Iterator pcePilotExpansion
  low-order (linear or quadratic) PCE generator for computing rotation matrices A_j for each of the QoI; this is low-order and potentially high-dimension whereas a client PCE could be high-order in the reduced dimension
• size_t numFullspaceVars
  Number of fullspace active continuous variables.
• bool adaptedBasisInitialized
  boolean flag to determine if mapping has been fully initialized
• unsigned int reducedRank
13.3. ADAPTEDBASISMODEL CLASS REFERENCE

---

current approximation of system rank

- RealMatrix rotationMatrix
  basis for the reduced subspace

- size_t miPLIndex
  the index of the active metaiterator-iterator parallelism level (corresponding to ParallelConfiguration::miPLIters) used at runtime

- int onlineEvalConcurrency
  Concurrency to use once subspace has been built.

- int offlineEvalConcurrency
  Concurrency to use when building subspace.

---

Static Protected Attributes

- static AdaptedBasisModel * abmInstance
  static pointer to this class for use in static callbacks

---

Additional Inherited Members

13.3.1 Detailed Description

Adapted basis model for input (variable space) reduction.

Specialization of a RecastModel that creates an adapted basis model during build phase and creates a RecastModel in the reduced space

13.3.2 Member Function Documentation

void derived_init_communicators ( ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag )
[inline], [protected], [virtual]

This specialization is because the model is used in multiple contexts depending on build phase.

Reimplemented from Model.

References Iterator::init_communicators(), Model::init_communicators(), AdaptedBasisModel::onlineEvalConcurrency, AdaptedBasisModel::pcePilotExpansion, and RecastModel::subModel.

void initialize_recast () [protected]

Initialize the base class RecastModel with reduced space variable sizes.

Initialize the recast model based on the reduced space, with no response function mapping (for now).

References Model::current_response(), Model::cv(), Model::div(), Model::drv(), Model::dsv(), Response::function_gradients(), Response::function_hessians(), RecastModel::init_maps(), RecastModel::init_sizes(), Model::num_nonlinear_ineq_constraints(), Model::num_primary_fns(), Model::num_secondary_fns(), AdaptedBasisModel::reduced-Rank, AdaptedBasisModel::response_mapping(), AdaptedBasisModel::set_mapping(), RecastModel::subModel, AdaptedBasisModel::variables_resize(), and AdaptedBasisModel::vars_mapping.

Referenced by AdaptedBasisModel::initialize_mapping().
void uncertain_vars_to_subspace ( ) [protected]
translate the characterization of uncertain variables in the native_model to the reduced space of the transformed model
  transform and set the distribution parameters in the reduced model
  Convert the user-specified normal random variables to the appropriate reduced space variables, based on the orthogonal transformation.
  TODO: Generalize to convert other random variable types (non-normal)
  TODO: The translation of the correlations from full to reduced space is likely wrong for rank correlations; should be correct for covariance.
  Referenced by AdaptedBasisModel::initialize_mapping().

void vars_mapping ( const Variables & recast_yvars, Variables & sub_model_xvars ) [static], [protected]
map the active continuous recast variables to the active submodel variables (linear transformation)
  Perform the variables mapping from recast reduced dimension variables y to original model x variables via linear transformation. Maps only continuous variables.
  References AdaptedBasisModel::abmInstance, Variables::continuous_variables(), Variables::continuous_variables_view(), Model::outputLevel, and AdaptedBasisModel::rotationMatrix.
  Referenced by AdaptedBasisModel::initialize_recast().

void set_mapping ( const Variables & recast_vars, const ActiveSet & recast_set, ActiveSet & sub_model_set ) [static], [protected]
map the inbound ActiveSet to the sub-model (map derivative variables)
  Simplified derivative variables mapping where all continuous depend on all others. TODO: Could instead rely on a richer default in RecastModel based on varsMapIndices.
  References AdaptedBasisModel::abmInstance, Variables::cv(), Model::cv(), ActiveSet::derivative_vector(), and RecastModel::subModel.
  Referenced by AdaptedBasisModel::initialize_recast().

void response_mapping ( const Variables & recast_yvars, const Variables & sub_model_xvars, const Response & sub_model_resp, Response & recast_resp ) [static], [protected]
map responses from the sub-model to the recast model
  Perform the response mapping from submodel to recast response
  References AdaptedBasisModel::abmInstance, Response::function_gradients(), Response::function_hessians(), Response::function_values(), and AdaptedBasisModel::rotationMatrix.
  Referenced by AdaptedBasisModel::initialize_recast().

13.3.3 Member Data Documentation

AdaptedBasisModel * abmInstance [static], [protected]
static pointer to this class for use in static callbacks
  initialization of static needed by RecastModel
  Referenced by AdaptedBasisModel::AdaptedBasisModel(), AdaptedBasisModel::response_mapping(), AdaptedBasisModel::set_mapping(), and AdaptedBasisModel::vars_mapping().
  The documentation for this class was generated from the following files:
13.4 AddAttributeVisitor Class Reference

Objects of this class are called by boost::apply_visitor to add attributes to HDF5 objects.
Inherits static_visitor<>.

Public Member Functions

- AddAttributeVisitor (const String &location, const std::shared_ptr<HDF5IOHelper> &hdf5_stream)

  The attributes will be added to the HDF5 object at location, using the HDF5IOHelper instance hdf5_stream.

- template<typename T>
  void operator() (const ResultAttribute<T> &a) const

  Called by boost::apply_visitor to process a ResultAttribute.

Private Attributes

- String location

  Link name of the HDF5 object to add attributes to.

- std::shared_ptr<HDF5IOHelper> hdf5Stream

  HDF5IOHelper instance.

13.4.1 Detailed Description

Objects of this class are called by boost::apply_visitor to add attributes to HDF5 objects.
The documentation for this class was generated from the following file:

- ResultsDBHDF5.hpp

13.5 Analyzer Class Reference

Base class for NonD, DACE, and ParamStudy branches of the iterator hierarchy.
Inheritance diagram for Analyzer:
Public Member Functions

- const VariablesArray & all_variables ()
  return the complete set of evaluated variables
- const RealMatrix & all_samples ()
  return the complete set of evaluated samples
- const IntResponseMap & all_responses () const
  return the complete set of computed responses
- bool resize ()
  reinitializes iterator based on new variable size
- int num_samples () const
- virtual void vary_pattern (bool pattern_flag)
  sets varyPattern in derived classes that support it

Protected Member Functions

- Analyzer ()
  default constructor
- Analyzer (ProblemDescDB &problem_db, Model &model)
  standard constructor
- Analyzer (unsigned short method_name, Model &model)
  alternate constructor for instantiations "on the fly" with a Model
- Analyzer (unsigned short method_name)
  alternate constructor for instantiations "on the fly" without a Model
- ~Analyzer ()
  destructor
13.5. ANALYZER CLASS REFERENCE

- virtual void `get_parameter_sets` (Model &model)
  
  Generate one block of numSamples samples (ndim * num_samples), populating allSamples; ParamStudy is the only class that specializes to use allVariables.

- virtual void `get_parameter_sets` (Model &model, const int num_samples, RealMatrix &design_matrix)
  
  Generate one block of numSamples samples (ndim * num_samples), populating design_matrix.

- virtual void `update_model_from_sample` (Model &model, const Real *sample_vars)
  
  update model’s current variables with data from sample

- virtual void `update_model_from_variables` (Model &model, const Variables &vars)
  
  update model’s current variables with data from vars

- virtual void `sample_to_variables` (const Real *sample_vars, Variables &vars)
  
  convert column of samples array to variables; derived classes may reimplement for more than active continuous variables

- void `update_from_model` (const Model &model)
  
  set inherited data attributes based on extractions from incoming model

- void `initialize_run` ()
  
  utility function to perform common operations prior to `pre_run()`; typically memory initialization; setting of instance pointers

- void `pre_run` ()
  
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

- void `post_run` (std::ostream &s)
  
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

- void `finalize_run` ()
  
  utility function to perform common operations following `post_run()`; deallocation and resetting of instance pointers

- void `pre_output` ()

- void `print_results` (std::ostream &s, short results_state=FINAL_RESULTS)
  
  print the final iterator results

- const Model & `algorithm_space_model` () const

- const Variables & `variables_results` () const
  
  return a single final iterator solution (variables)

- const Response & `response_results` () const
  
  return a single final iterator solution (response)

- const VariablesArray & `variables_array_results` ()
  
  return multiple final iterator solutions (variables). This should only be used if `returns_multiple_points()` returns true.

- const ResponseArray & `response_array_results` ()
  
  return multiple final iterator solutions (response). This should only be used if `returns_multiple_points()` returns true.

- void `response_results_active_set` (const ActiveSet &set)
  
  set the requested data for the final iterator response results

- bool `compact_mode` () const
  
  returns Analyzer::compactMode

- bool `returns_multiple_points` () const
  
  indicates if this iterator returns multiple final points. Default return is false. Override to return true if appropriate.
• void evaluate_parameter_sets (Model &model, bool log_resp_flag, bool log_best_flag)
  perform function evaluations to map parameter sets (allVariables) into response sets (allResponses)
• void get_vbd_parameter_sets (Model &model, int num_samples)
  generate replicate parameter sets for use in variance-based decomposition
• void compute_vbd_stats (const int num_samples, const IntResponseMap &resp_samples)
  compute VBD-based Sobol indices
• void archive_sobol_indices () const
  archive VBD-based Sobol indices
• virtual void archive_model_variables (const Model &, size_t idx) const
  archive model evaluation points
• virtual void archive_model_response (const Response &, size_t idx) const
  archive model evaluation responses
• void read_variables_responses (int num_evals, size_t num_vars)
  convenience function for reading variables/responses (used in derived classes post_input)
• void print_sobol_indices (std::ostream &s) const
  Printing of VBD results.
• void samples_to_variables_array (const RealMatrix &sample_matrix, VariablesArray &vars_array)
  convert samples array to variables array; e.g., allSamples to allVariables
• virtual void variables_to_sample (const Variables &vars, Real *sample_c_vars)
  convert the active continuous variables into a column of allSamples
• void variables_array_to_samples (const VariablesArray &vars_array, RealMatrix &sample_matrix)
  convert variables array to samples array; e.g., allVariables to allSamples

Protected Attributes

• size_t numFunctions
  number of response functions
• size_t numContinuousVars
  number of active continuous vars
• size_t numDiscreteIntVars
  number of active discrete integer vars
• size_t numDiscreteStringVars
  number of active discrete string vars
• size_t numDiscreteRealVars
  number of active discrete real vars
• bool compactMode
  switch for allSamples (compact mode) instead of allVariables (normal mode)
• VariablesArray allVariables
  array of all variables to be evaluated in evaluate_parameter_sets()
• RealMatrix allSamples
  compact alternative to allVariables
• IntResponseMap allResponses
  array of all responses to be computed in evaluate_parameter_sets()
13.5. ANALYZER CLASS REFERENCE

- **StringArray allHeaders**
  array of headers to insert into output while evaluating allVariables

- **size_t numObjFns**
  number of objective functions

- **size_t numLSqTerms**
  number of least squares terms

- **RealPairPRPMultiMap bestVarsRespMap**
  map which stores best set of solutions

### Private Member Functions

- **void compute_best_metrics (const Response &response, std::pair<Real, Real> &metrics)**
  compares current evaluation to best evaluation and updates best

- **void update_best (const Variables &vars, int eval_id, const Response &response)**
  compares current evaluation to best evaluation and updates best

- **void update_best (const Real *sample.c_vars, int eval_id, const Response &response)**
  compares current evaluation to best evaluation and updates best

### Private Attributes

- **int writePrecision**
  write precision as specified by the user

- **Real vbdDropTol**
  tolerance for omitting output of small VBD indices

- **RealVectorArray S4**
  VBD main effect indices.

- **RealVectorArray T4**
  VBD total effect indices.

### Additional Inherited Members

13.5.1 Detailed Description

Base class for NonD, DACE, and ParamStudy branches of the iterator hierarchy.

The Analyzer class provides common data and functionality for various types of systems analysis, including nondeterministic analysis, design of experiments, and parameter studies.

13.5.2 Member Function Documentation

**int num_samples ( ) const [inline], [virtual]**

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Iterator.

Reimplemented in NonDSampling, NonDQuadrature, NonDSParseGrid, NonDcubature, DDACEDesignCompExp, FSUDesignCompExp, and PSUADEDesignCompExp.

References Model::derivative_concurrency(), Iterator::iteratedModel, and Iterator::maxEvalConcurrency.
References NonDDREAMBayesCalibration::archive_acceptance_chain(), NonDDREAMBayesCalibration::cache_chain(), NonDBayesCalibration::compute_statistics(), Analyzer::compute_vbd_stats(), NonDGlobalReliability::get_best_sample(), Analyzer::get_vbd_parameter_sets(), NonDPolynomialChaos::ratio_samples_to_order(), Analyzer::samples_to_variables_array(), and Analyzer::variables_array_to_samples.

**void sample_to_variables** (const Real *sample_c_vars, Variables &vars) [protected], [virtual]

Convert column of samples array to variables; derived classes may reimplement for more than active continuous variables

Default mapping that maps into continuous part of Variables only

Reimplemented in NonDSampling.

References Variables::adiv(), Variables::adrv(), Variables::all_discrete_int_variables(), Variables::all_discrete_real_variables(), Variables::continuous_variable(), Model::current_variables(), Variables::inactive_continuous_variables(), Variables::is_null(), Iterator::iteratedModel, Analyzer::numContinuousVars, and Variables::shared_data.

Referenced by NonDLHSEvidence::post_process_samples(), Analyzer::pre_output(), Analyzer::samples_to_variables_array(), and Analyzer::update_best.

**void initialize_run** ( ) [protected], [virtual]

Utility function to perform common operations prior to pre_run(); typically memory initialization; setting of instance pointers

Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically before performing its own implementation steps.

Reimplemented from Iterator.

Reimplemented in NonD, NonDSampling, NonDLHSSampling, DDACEDesignCompExp, NonDRKDDarts, FSUDesignCompExp, ParamStudy, NonDMultilevelSampling, and PSUADEDesignCompExp.

References Analyzer::bestVarsRespMap.

Referenced by PSUADEDesignCompExp::pre_run(), ParamStudy::pre_run(), FSUDesignCompExp::pre_run(), DDACEDesignCompExp::pre_run(), and NonD::pre_run.

**void pre_run** ( ) [protected], [virtual]

Pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

Pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented from Iterator.

Reimplemented in NonDSampling, NonD, NonDLHSSampling, DDACEDesignCompExp, NonDRKDDarts, FSUDesignCompExp, ParamStudy, NonDMultilevelSampling, and PSUADEDesignCompExp.

References Analyzer::bestVarsRespMap.

Referenced by PSUADEDesignCompExp::pre_run(), ParamStudy::pre_run(), FSUDesignCompExp::pre_run(), DDACEDesignCompExp::pre_run(), and NonD::pre_run.

**void post_run** (std::ostream &s) [protected], [virtual]

Post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way
13.5. ANALYZER CLASS REFERENCE

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically after performing its own implementation steps.

Reimplemented from Iterator.

References Model::is_null(), Iterator::iteratedModel, Model::print_evaluation_summary(), Analyzer::print_results(), and Iterator::summaryOutputFlag.

Referenced by NonDMultilevelSampling::post_run(), PSUADEDesignCompExp::post_run(), ParamStudy::post_run(), FSUDesignCompExp::post_run(), DDACEDesignCompExp::post_run(), NonDLHSSampling::post_run(), and NonDRKDDarts::post_run().

```cpp
void finalize_run()
```

utility function to perform common operations following post_run(): deallocation and resetting of instance pointers

Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically after performing its own implementation steps.

Reimplemented from Iterator.

Reimplemented in NonD.

References Model::finalize_mapping(), Iterator::finalize_run(), Iterator::iteratedModel, Model::mapping_initialized(), and Analyzer::resize().

Referenced by NonD::finalize_run().

```cpp
void pre_output()
```

Generate tabular output with active variables (compactMode) or all variables with their labels and response labels, with no data. Variables are sequenced {cv, div, drv}

Reimplemented from Iterator.

References Analyzer::allSamples, Analyzer::allVariables, ParallelLibrary::command_line_pre_run_output(), ParallelLibrary::command_line_user_modes(), Analyzer::compactMode, Variables::copy(), Model::current_response(), Model::current_variables(), Model::interface_id(), Iterator::iteratedModel, Iterator::outputLevel, Iterator::parallelLib, ProgramOptions::pre_run_output_format(), ParallelLibrary::program_options(), Analyzer::sample_to_variables(), Dakota::write_precision, Variables::write_tabular(), and Analyzer::writePrecision.

```cpp
void print_results( std::ostream & s, short results_state = FINAL_RESULTS )
```

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Iterator.

Reimplemented in NonDPolynomialChaos, NonDGPMMSABayesCalibration, NonDLHSSampling, NonDBayesCalibration, NonDPOFDarts, NonDMultilevelPolynomialChaos, NonDQUESTOBayesCalibration, NonDLLocalReliability, NonDPIANoBayesCalibration, NonDAdaptiveSampling, NonDGPImpSampling, NonDMultilevelStochCollocation, NonDAdaptImpSampling, NonDInterval, NonDMultilevelSampling, PStudyDACE, NonDExpansion, Verification, NonDGlobalReliability, and RichExtrapVerification.

References Analyzer::bestVarsRespMap, ParamResponsePair::eval_id(), Response::function_values(), Analyzer::numLSqTerms, Analyzer::numObjFns, ParamResponsePair::response(), ParamResponsePair::variables(), and Dakota::write_data_partial().
CHAPTER 13. CLASS DOCUMENTATION

Referenced by Analyzer::post_run(), Verification::print_results(), PStudyDACE::print_results(), and NonDLHSSampling::print_results().

**const Model & algorithm::space_model( ) const [inline], [protected], [virtual]**

default definition that gets redefined in selected derived Minimizers
Reimplemented from Iterator.
Reimplemented in NonDBayesCalibration, NonDExpansion, NonDGlobalInterval, and NonDReliability.
References Iterator::iteratedModel.

**void evaluate_parameter_sets ( Model & model, bool log resp flag, bool log best flag ) [protected]**

perform function evaluations to map parameter sets (allVariables) into response sets (allResponses)
Convenience function for derived classes with sets of function evaluations to perform (e.g., NonDSampling, DDACEDesignCompExp, FSUDEDesignCompExp, ParamStudy).
References ResultsManager::active(), Iterator::activeSet, Analyzer::allHeaders, Analyzer::allResponses, Analyzer::allSamples, Analyzer::archive_model_response(), Analyzer::archive_model_variables(), Model::asynch_flag(), Analyzer::compactMode, Response::copy(), Model::current_response(), Model::current_variable(), Model::evaluate(), Model::evaluate_nowait(), Model::evaluation_id(), Iterator::resultsDB, Model::synchronize(), Analyzer::update_best(), Analyzer::update_model_from_sample(), and Analyzer::update_model_from_variables().

Referenced by ParamStudy::core_run(), PStudyDCEDesignCompExp::core_run(), FSUDEDesignCompExp::core_run(), NonDAdaptImpSampling::core_run(), DDACEDesignCompExp::core_run(), NonDLHSSampling::core_run(), NonDIntegration::core_run(), NonDSampling::core_run(), NonDSparseGrid::evaluate_grid_increment(), NonDQuadrature::evaluate_grid_increment(), NonDSparseGrid::evaluate_set(), NonDMultilevelSampling::lf_increment(), NonDMultilevelSampling::multilevel_control_variate_mc_Qcorr(), NonDMultilevelSampling::multilevel_control_variate_mc_Ycorr(), NonDMultilevelSampling::multilevel_mc_Qsum(), NonDMultilevelSampling::multilevel_mc_Ysum(), NonDMultilevelSampling::shared_increment(), and NonDQUESOBayesCalibration::update_model().

**void get_vbd_parameter_sets ( Model & model, int num_samples ) [protected]**

generate replicate parameter sets for use in variance-based decomposition
Generate (numvars + 2) ∗ num_samples replicate sets for VBD, populating allSamples( numvars, (numvars + 2) ∗ num_samples )
References Dakota::abort_handler(), Analyzer::allSamples, Analyzer::compactMode, Analyzer::get_parameter_sets(), Analyzer::num_samples(), Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, and Analyzer::vary_pattern().

Referenced by FSUDEDesignCompExp::pre_run(), DDACEDesignCompExp::pre_run(), and NonDLHSSampling::pre_run().

**void compute_vbd_stats ( const int num_samples, const IntResponseMap & resp samples ) [protected]**

calculate VBD-based Sobol indices
Calculation of sensitivity indices obtained by variance based decomposition. These indices are obtained by the Saltelli version of the Sobol VBD which uses (K+2) ∗ N function evaluations, where K is the number of dimensions (uncertain vars) and N is the number of samples.
References Dakota::abort_handler(), Analyzer::allSamples, Analyzer::num_samples(), Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, Analyzer::numFunctions, Analyzer::S4, and Analyzer::T4.

Referenced by FSUDEDesignCompExp::post_run(), DDACEDesignCompExp::post_run(), and NonDLHSSampling::post_run().
void archive_sobol_indices ( ) const [protected]

archive VBD-based Sobol indices
  printing of variance based decomposition indices.
  References ResultsManager::active(), Model::continuous_variable_labels(), Model::discrete_int_variable_labels(), Model::discrete_real_variable_labels(), ResultsManager::insert(), Iterator::iteratedModel, main(), Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numFunctions, Model::response_labels(), Iterator::resultsDB, Iterator::run_identifier(), Analyzer::S4, Analyzer::T4, and Analyzer::vbdDropTol.
  Referenced by NonDLHSSampling::post_run().

void read_variables_responses ( int num_evals, size_t num_vars ) [protected]

convenience function for reading variables/responses (used in derived classes post_input)
  read num_evals variables/responses from file
  References Dakota::abort_handler(), Analyzer::allResponses, Analyzer::allSamples, Analyzer::allVariables, ParallelLibrary::command_line_post_run_input(), ParallelLibrary::command_line_user_modes(), Analyzer::compactMode, Response::copy(), Variables::copy(), Model::current_response(), Model::current_variables(), Dakota::data_pairs, ParamResponsePair::eval_id(), Model::evaluation_cache(), Iterator::iteratedModel, Model::manage_data_recastings(), Analyzer::numLSqTerms, Analyzer::numObjFns, Iterator::outputLevel, Iterator::parallelLib, ProgramOptions::post_run_input_format(), ParallelLibrary::program_options(), ParamResponsePair::response(), Model::restart_file(), Analyzer::update_best(), Model::user_space_to_iterator_space(), ParamResponsePair::variables(), Analyzer::variables_to_sample(), and ParallelLibrary::write_restart().
  Referenced by PSUADEDesignCompExp::post_input(), ParamStudy::post_input(), FSUDesignCompExp::post_input(), DDACEDesignCompExp::post_input(), and NonDLHSSampling::post_input().

void print_sobol_indices ( std::ostream & s ) const [protected]

Printing of VBD results.
  printing of variance based decomposition indices.
  References Model::continuous_variable_labels(), Model::discrete_int_variable_labels(), Model::discrete_real_variable_labels(), Iterator::iteratedModel, main(), Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numFunctions, Model::response_labels(), Analyzer::S4, Analyzer::T4, Analyzer::vbdDropTol, and Dakota::write_precision.
  Referenced by PStudyDACE::print_results(), and NonDLHSSampling::print_results().

void variables_to_sample ( const Variables & vars, Real * sample_c vars ) [protected], [virtual]

convert the active continuous variables into a column of allSamples
  Default implementation maps active continuous variables only
  Reimplemented in NonDSampling.
  References Variables::continuous_variables(), and Analyzer::numContinuousVars.
  Referenced by Analyzer::read_variables_responses(), and Analyzer::variables_array_to_samples().
The documentation for this class was generated from the following files:

- DakotaAnalyzer.hpp
- DakotaAnalyzer.cpp
13.6 ApplicationInterface Class Reference

Derived class within the interface class hierarchy for supporting interfaces to simulation codes.

Inheritance diagram for ApplicationInterface:

```
  Interface
   |  ApplicationInterface
  DirectApplicInterface
   |  ProcessApplicInterface
      |  MatlabInterface
      |  PythonInterface
      |  ScilabInterface
      |  TestDriverInterface
      |  ParallelDirectApplicInterface
      |  SerialDirectApplicInterface
```

**Public Member Functions**

- `ApplicationInterface (const ProblemDescDB &problem_db)`
  * constructor
- `~ApplicationInterface ()`
  * destructor

**Protected Member Functions**

- void `init_communicators (const IntArray &message_lengths, int max_eval_concurrency)`
  * allocate communicator partitions for concurrent evaluations within an iterator and concurrent multiprocessor analyses within an evaluation.
- void `set_communicators (const IntArray &message_lengths, int max_eval_concurrency)`
  * set the local parallel partition data for an interface (the partitions are already allocated in ParallelLibrary).
- void `init_serial ()`
- int `asynch_local_evaluation_concurrency () const`
  * return asynchLocalEvalConcurrency
- short `interface_synchronization () const`
  * return interfaceSynchronization
- bool `evaluation_cache () const`
  * return evalCacheFlag
- bool `restart_file () const`
  * return evalCacheFlag
- void `map (const Variables &vars, const ActiveSet &set, Response &response, bool asynch_flag=false)`
13.6. APPLICATIONINTERFACE CLASS REFERENCE

Provides a "mapping" of variables to responses using a simulation. Protected due to Interface letter-envelope idiom.

- void manage_failure (const Variables &vars, const ActiveSet &set, Response &response, int failed_eval_id)
  manages a simulation failure using abort/retry/recover/continuation
- const IntResponseMap & synchronize ()
  executes a blocking schedule for asynchronous evaluations in the beforeSynchCorePRPQueue and returns all jobs
- const IntResponseMap & synchronize_nowait ()
  executes a nonblocking schedule for asynchronous evaluations in the beforeSynchCorePRPQueue and returns a partial set of completed jobs
- void serve_evaluations ()
  run on evaluation servers to serve the iterator master
- void stop_evaluation_servers ()
  used by the iterator master to terminate evaluation servers
- bool check_multiprocessor_analysis (bool warn)
  checks on multiprocessor analysis configuration
- bool check_asynchronous (bool warn, int max_eval_concurrency)
  checks on asynchronous configuration (for direct interfaces)
- bool check_multiprocessor_asynchronous (bool warn, int max_eval_concurrency)
  checks on asynchronous settings for multiprocessor partitions
- virtual void derived_map (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)
  Called by map() and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.
- virtual void derived_map_asynch (const ParamResponsePair &pair)
  Called by map() and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.
- virtual void wait_local_evaluations (PRPQueue &prp_queue)
  For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.
- virtual void test_local_evaluations (PRPQueue &prp_queue)
  For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.
- virtual void init_communicators_checks (int max_eval_concurrency)
  perform construct-time error checks on the parallel configuration
- virtual void set_communicators_checks (int max_eval_concurrency)
  perform run-time error checks on the parallel configuration
- void master_dynamic_schedule_analyses ()
  blocking dynamic schedule of all analyses within a function evaluation using message passing
- void serve_analyses_synch ()
  serve the master analysis scheduler and manage one synchronous analysis job at a time
- virtual int synchronous_local_analysis (int analysis_id)
  Execute a particular analysis (identified by analysis_id) synchronously on the local processor. Used for the derived class specifics within ApplicationInterface::serve_analyses_synch().
Protected Attributes

- **ParallelLibrary** & **parallelLib**
  reference to the ParallelLibrary object used to manage MPI partitions for the concurrent evaluations and concurrent analyses parallelism levels

- **bool suppressOutput**
  flag for suppressing output on slave processors

- **int evalCommSize**
  size of evalComm

- **int evalCommRank**
  processor rank within evalComm

- **int evalServerId**
  evaluation server identifier

- **bool eaDedMasterFlag**
  flag for dedicated master partitioning at ea level

- **int analysisCommSize**
  size of analysisComm

- **int analysisCommRank**
  processor rank within analysisComm

- **int analysisServerId**
  analysis server identifier

- **int numAnalysisServers**
  current number of analysis servers

- **bool multiProcAnalysisFlag**
  flag for multiprocessor analysis partitions

- **bool asynchLocalAnalysisFlag**
  flag for asynchronous local parallelism of analyses

- **int asynchLocalAnalysisConcurrency**
  limits the number of concurrent analyses in asynchronous local scheduling and specifies hybrid concurrency when message passing

- **int asynchLocalEvalConcSpec**
  user specification for asynchronous local evaluation concurrency

- **int asynchLocalAnalysisConcSpec**
  user specification for asynchronous local analysis concurrency

- **int numAnalysisDrivers**
  the number of analysis drivers used for each function evaluation (from the analysis_drivers interface specification)

- **IntSet completionSet**
  the set of completed fn_eval_id’s populated by wait_local_evaluations() and test_local_evaluations()

- **String failureMessage**
  base message for managing failed evals; will be followed with more details in screen output
13.6. APPLICATIONINTERFACE CLASS REFERENCE

Private Member Functions

- **bool duplication_detect (const Variables &vars, Response &response, bool asynch_flag)**
  checks data pairs and beforeSynchCorePRPQueue to see if the current evaluation request has already been performed or queued.

- **void init_default_av (size_t num_fns)**
  initialize default ASV if needed; this is done at run time due to post-construct time Response size changes.

- **void master_dynamic_schedule_evaluations ()**
  blocking dynamic schedule of all evaluations in beforeSynchCorePRPQueue using message passing on a dedicated master partition; executes on iteratorComm master.

- **void peer_static_schedule_evaluations ()**
  blocking static schedule of all evaluations in beforeSynchCorePRPQueue using message passing on a peer partition; executes on iteratorComm master.

- **void peer_dynamic_schedule_evaluations ()**
  blocking dynamic schedule of all evaluations in beforeSynchCorePRPQueue using message passing on a peer partition; executes on iteratorComm master.

- **void asynchronous_local_evaluations (PRPQueue &prp_queue)**
  perform all jobs in prp_queue using asynchronous approaches on the local processor.

- **void synchronous_local_evaluations (PRPQueue &prp_queue)**
  perform all jobs in prp_queue using synchronous approaches on the local processor.

- **void master_dynamic_schedule_evaluations_nowait ()**
  execute a nonblocking dynamic schedule in a master-slave partition.

- **void peer_static_schedule_evaluations_nowait ()**
  execute a nonblocking static schedule in a peer partition.

- **void peer_dynamic_schedule_evaluations_nowait ()**
  execute a nonblocking dynamic schedule in a peer partition.

- **void asynchronous_local_evaluations_nowait (PRPQueue &prp_queue)**
  launch new jobs in prp_queue asynchronously (if capacity is available), perform nonblocking query of all running jobs, and process any completed jobs (handles both local master- and local peer-scheduling cases).

- **void broadcast_evaluation (const ParamResponsePair &pair)**
  convenience function for broadcasting an evaluation over an evalComm.

- **void broadcast_evaluation (int fn_eval_id, const Variables &vars, const ActiveSet &set)**
  convenience function for broadcasting an evaluation over an evalComm.

- **void send_evaluation (PRPQueueIter &prp_iter, size_t buff_index, int server_id, bool peer_flag)**
  helper function for sending sendBuffers[buff_index] to server.

- **void receive_evaluation (PRPQueueIter &prp_iter, size_t buff_index, int server_id, bool peer_flag)**
  helper function for processing recvBuffers[buff_index] within scheduler.

- **void launch_asynch_local (PRPQueueIter &prp_iter)**
  launch an asynchronous local evaluation.

- **void process_asynch_local (int fn_eval_id)**
  process a completed asynchronous local evaluation.

- **void process_synch_local (PRPQueueIter &prp_iter)**
  process a completed synchronous local evaluation.

- **void assign_asynch_local_queue (PRPQueue &local_prp_queue, PRPQueueIter &local_prp_iter)**
CHAPTER 13. CLASS DOCUMENTATION

helper function for creating an initial active local queue by launching async local jobs from local \texttt{prp\_queue}, as limited by server capacity

- **void assign\_asynch\_local\_queue\_nowait** (PRPQueue &local\_prp\_queue, PRPQueueIter &local\_prp\_iter)

  helper function for updating an active local queue by backfilling async local jobs from local \texttt{prp\_queue}, as limited by server capacity

- **size\_t test\_local\_backfill** (PRPQueue &assign\_queue, PRPQueueIter &assign\_iter)

  helper function for testing active async local jobs and then backfilling

- **size\_t test\_receives\_backfill** (PRPQueueIter &assign\_iter, bool peer\_flag)

  helper function for testing receive requests and then backfilling jobs

- **void serve\_evaluations\_synch**()

  serve the evaluation message passing schedulers and perform one synchronous evaluation at a time

- **void serve\_evaluations\_synch\_peer**()

  serve the evaluation message passing schedulers and perform one synchronous evaluation at a time as part of the 1st peer

- **void serve\_evaluations\_asynch**()

  serve the evaluation message passing schedulers and manage multiple asynchronous evaluations

- **void serve\_evaluations\_asynch\_peer**()

  serve the evaluation message passing schedulers and perform multiple asynchronous evaluations as part of the 1st peer

- **void set\_evaluation\_communicators** (const IntArray &message\_lengths)

  convenience function for updating the local evaluation partition data following \texttt{ParallelLibrary::init\_evaluation\_communicators}.

- **void set\_analysis\_communicators**()

  convenience function for updating the local analysis partition data following \texttt{ParallelLibrary::init\_analysis\_communicators}.

- **void init\_serial\_evaluations**()

  set concurrent evaluation configuration for serial operations

- **void init\_serial\_analyses**()

  set concurrent analysis configuration for serial operations (e.g., for local executions on a dedicated master)

- **const ParamResponsePair & get\_source\_pair** (const Variables &target\_vars)

  convenience function for the continuation approach in \texttt{manage\_failure}() for finding the nearest successful "source" evaluation to the failed "target"

- **void continuation** (const Variables &target\_vars, const ActiveSet &set, Response &response, const ParamResponsePair &source\_pair, int failed\_eval\_id)

  performs a 0th order continuation method to step from a successful "source" evaluation to the failed "target".
  Invoked by \texttt{manage\_failure}() for failAction == "continuation".

- **void common\_input\_filtering** (const Variables &vars)

  common input filtering operations, e.g. mesh movement

- **void common\_output\_filtering** (Response &response)

  common output filtering operations, e.g. data filtering
Private Attributes

- int worldSize
  - size of MPI_COMM_WORLD
- int worldRank
  - processor rank within MPI_COMM_WORLD
- int iteratorCommSize
  - size of iteratorComm
- int iteratorCommRank
  - processor rank within iteratorComm
- bool ieMessagePass
  - flag for message passing at ie scheduling level
- int numEvalServers
  - current number of evaluation servers
- int numEvalServersSpec
  - user specification for number of evaluation servers
- int procsPerEvalSpec
  - user specification for processors per analysis servers
- bool eaMessagePass
  - flag for message passing at ea scheduling level
- int numAnalysisServersSpec
  - user spec for number of analysis servers
- int procsPerAnalysisSpec
  - user specification for processors per analysis servers
- int lenVarsMessage
  - length of a MPIPackBuffer containing a Variables object; computed in Model::init_communicators()
- int lenVarsActSetMessage
  - length of a MPIPackBuffer containing a Variables object and an ActiveSet object; computed in Model::init_communicators()
- int lenResponseMessage
  - length of a MPIPackBuffer containing a Response object; computed in Model::init_communicators()
- int lenPRPairMessage
  - length of a MPIPackBuffer containing a ParamResponsePair object; computed in Model::init_communicators()
- short evalScheduling
  - user specification of evaluation scheduling algorithm: \{DEFAULT,MASTER,PEER_DYNAMIC,PEER_STATIC\} - SCHEDULING. Used for manual overrides of auto-configure logic in ParallelLibrary::resolve_inputs().
- short analysisScheduling
  - user specification of analysis scheduling algorithm: \{DEFAULT,MASTER,PEER\} - SCHEDULING. Used for manual overrides of the auto-configure logic in ParallelLibrary::resolve_inputs().
- int asynchLocalEvalConcurrency
  - limits the number of concurrent evaluations in asynchronous local scheduling and specifies hybrid concurrency when message passing
- bool asynchLocalEvalStatic
  - whether the asynchronous local evaluations are to be performed with a static schedule (default false)
• BitArray `localServerAssigned`  
  array with one bit per logical “server” indicating whether a job is currently running on the server (used for asynch local static schedules)

• short `interfaceSynchronization`  
  interface synchronization specification: synchronous (default) or asynchronous

• bool `headerFlag`  
  used by `synchronize_nowait` to manage header output frequency (since this function may be called many times prior to any completions)

• bool `asvControlFlag`  
  used to manage a user request to deactivate the active set vector control. true = modify the ASV each evaluation as appropriate (default); false = ASV values are static so that the user need not check them on each evaluation.

• bool `evalCacheFlag`  
  used to manage a user request to deactivate the function evaluation cache (i.e., queries and insertions using the data pairs cache).

• bool `nearbyDuplicateDetect`  
  flag indicating optional usage of tolerance-based duplication detection (less efficient, but helpful when experiencing restart cache misses)

• Real `nearbyTolerance`  
  tolerance value for tolerance-based duplication detection

• bool `restartFileFlag`  
  used to manage a user request to deactivate the restart file (i.e., insertions into write_restart).

• SharedResponseData `sharedRespData`  
  `SharedResponseData` of associated `Response`.

• String `gradientType`  
  type of gradients present in associated `Response`

• String `hessianType`  
  type of Hessians present in associated `Response`

• IntSet `gradMixedAnalyticIds`  
  IDs of analytic gradients when mixed gradients present.

• IntSet `hessMixedAnalyticIds`  
  IDs of analytic gradients when mixed gradients present.

• ShortArray `defaultASV`  
  the static ASV values used when the user has selected `asvControl = off`

• String `failAction`  
  mitigation action for captured simulation failures: abort, retry, recover, or continuation

• int `failRetryLimit`  
  limit on the number of retries for the retry `failAction`

• RealVector `failRecoveryFnVals`  
  the dummy function values used for the recover `failAction`

• IntResponseMap `historyDuplicateMap`  
  used to bookkeep asynchronous evaluations which duplicate data pairs evaluations. Map key is `evalIdCntr`, map value is corresponding response.

• std::map< int, std::pair< PRPQueueHIter, Response >> `beforeSynchDuplicateMap`
used to bookkeep evalIdCnt, beforeSynchCorePRPQueue iterator, and response of asynchronous evaluations which
duplicate queued beforeSynchCorePRPQueue evaluations

- PRPQueue beforeSynchCorePRPQueue
  used to bookkeep vars/set/response of nonduplicate asynchronous core evaluations. This is the queue of jobs popu-
lated by asynchronous map() that is later scheduled in synchronize() or synchronize_nowait().

- PRPQueue beforeSynchAlgPRPQueue
  used to bookkeep vars/set/response of asynchronous algebraic evaluations. This is the queue of algebraic jobs
  populated by asynchronous map() that is later evaluated in synchronize() or synchronize_nowait().

- PRPQueue asyncLocalActivePRPQueue
  used by nonblocking asynchronous local schedulers to bookkeep active local jobs

- std::map<int, IntSizetPair> msgPassRunningMap
  used by nonblocking message passing schedulers to bookkeep which jobs are running remotely

- int nowaitEvalIdRef
  fnEvalId reference point for preserving modulo arithmetic-based job assignment in case of peer static nonblocking
  schedulers

- MPIPackBuffer * sendBuffers
  array of pack buffers for evaluation jobs queued to a server

- MPIUnpackBuffer * recvBuffers
  array of unpack buffers for evaluation jobs returned by a server

- MPI_Request * recvRequests
  array of requests for nonblocking evaluation receives

### 13.6.1 Detailed Description

Derived class within the interface class hierarchy for supporting interfaces to simulation codes.

ApplicationInterface provides an interface class for performing parameter to response mappings using simulation
code(s). It provides common functionality for a number of derived classes and contains the majority of all of
the scheduling algorithms in DAKOTA. The derived classes provide the specifics for managing code invocations
using system calls, forks, direct procedure calls, or distributed resource facilities.

### 13.6.2 Member Function Documentation

#### void init_serial( ) [inline], [protected], [virtual]

DataInterface.cpp defaults of 0 servers are needed to distinguish an explicit user request for 1 server (serialization
of a parallelism level) from no user request (use parallel auto-config). This default causes problems when
init_communicators() is not called for an interface object (e.g., static scheduling fails in DirectApplicationInterface-:
derived_map() for NestedModel::optionalInterface). This is the reason for this function: to reset certain defaults
for interface objects that are used serially.

Reimplemented from Interface.

References ApplicationInterface::init_serial_analyses(), and ApplicationInterface::init_serial_evaluations().

#### void map ( const Variables & vars, const ActiveSet & set, Response & response, bool async_flag = false ) [protected], [virtual]

Provides a ”mapping” of variables to responses using a simulation. Protected due to Interface letter-envelope idiom.
CHAPTER 13. CLASS DOCUMENTATION

The function evaluator for application interfaces. Called from derived\_evaluate() and derived\_evaluate\_nowait() in derived Model classes. If asynch\_flag is not set, perform a blocking evaluation (using derived\_map()). If asynch\_flag is set, add the job to the beforeSynchCorePRPQueue queue for execution by one of the scheduler routines in synchronize() or synchronize\_nowait(). Duplicate function evaluations are detected with duplication\_detect().

Reimplemented from Interface.

References Response::active\_set(), Interface::algebraic\_mappings(), Interface::algebraicMappings, Interface::asv\_mapping(), ApplicationInterface::asv\_ControlFlag, ApplicationInterface::beforeSynchAlgPRPQueue, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::broadcast\_evaluation(), Response::copy(), Interface::coreMappings, Interface::currEval\_Id, Dakota::data\_pairs, ApplicationInterface::default\_ASV, ApplicationInterface::derived\_map(), ApplicationInterface::duplication\_detect(), ApplicationInterface::eval\_CacheFlag, Interface::eval\_Id\_Cntr, Interface::fine\_GrainEval\_Counters, Interface::fn\_Grad\_Counter, Interface::fn\_Hess\_Counter, Interface::fn\_Labels, Interface::fn\_Val\_Counter, Response::function\_labels(), Interface::init\_algebraic\_mappings(), ApplicationInterface::init\_default\_asv(), Interface::init\_evaluation\_counters(), Interface::interface\_Id, ApplicationInterface::manage\_failure(), Interface::multi\_Proc\_Eval\_Flag, Interface::new\_Eval\_Id\_Cntr, Interface::new\_Fn\_Grad\_Counter, Interface::new\_Fn\_Hess\_Counter, Interface::new\_Fn\_Val\_Counter, Interface::output\_Level, ApplicationInterface::parallel\_Lib, ActiveSet::request\_vector(), Interface::response\_mapping(), ApplicationInterface::restart\_File\_Flag, ApplicationInterface::shared\_Resp\_Data, and ParallelLibrary::write\_restart().

const IntResponseMap & synchronize ( ) [protected], [virtual]

executes a blocking schedule for asynchronous evaluations in the beforeSynchCorePRPQueue and returns all jobs. This function provides blocking synchronization for all cases of asynchronous evaluations, including the local asynchronous case (background system call, nonblocking fork, & multithreads), the message passing case, and the hybrid case. Called from derived\_synchronize() in derived Model classes.

Reimplemented from Interface.

References Interface::algebraic\_mappings(), Interface::algebraic\_Mappings, Interface::asv\_mapping(), ApplicationInterface::asynch\_Local\_Eval\_Static, ApplicationInterface::asynch\_local\_evaluations(), ApplicationInterface::beforeSynchAlgPRPQueue, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::beforeSynch\_Duplicate\_Map, Interface::cached\_Response\_Map, Interface::core\_Mappings, ApplicationInterface::eval\_Scheduling, ApplicationInterface::history\_Duplicate\_Map, Interface::ie\_Ded\_Master\_Flag, ApplicationInterface::ie\_Message\_Pass, Interface::interface\_Id, Interface::interface\_Type, ApplicationInterface::master\_dynamic\_schedule\_evaluations\_nowait(), Interface::multi\_Proc\_Eval\_Flag, Interface::output\_Level, ApplicationInterface::peer\_dynamic\_schedule\_evaluations\_nowait(), ApplicationInterface::peer\_static\_schedule\_evaluations\_nowait(), Interface::raw\_Response\_Map, Interface::response\_mapping(), and ApplicationInterface::shared\_Resp\_Data.

const IntResponseMap & synchronize\_nowait ( ) [protected], [virtual]

executes a nonblocking schedule for asynchronous evaluations in the beforeSynchCorePRPQueue and returns a partial set of completed jobs. This function provides nonblocking synchronization for the local asynchronous case and selected nonblocking message passing schedulers. Called from derived\_synchronize\_nowait() in derived Model classes.

Reimplemented from Interface.

EvalFlag, Interface::outputLevel, ApplicationInterface::peer_dynamic_schedule_evaluations_nowait(), ApplicationInterface::peer_static_schedule_evaluations_nowait(), Interface::rawResponseMap, ParamResponsePair::response(), Interface::response_mapping(), ApplicationInterface::sharedRespData, and Response::update().

**void serve_evaluations()** [protected], [virtual]

run on evaluation servers to serve the iterator master

Invoked by the serve() function in derived Model classes. Passes control to serve_evaluations_synch(), serve_evaluations_asynch(), serve_evaluations_synch_peer(), or serve_evaluations_asynch_peer() according to specified concurrency, partition, and scheduler configuration.

Reimplemented from Interface.

References ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::evalServerId, Interface::ieDedMasterFlag, ApplicationInterface::serve_evaluations_asynch(), ApplicationInterface::serve_evaluations_asynch_peer(), ApplicationInterface::serve_evaluations_synch(), and ApplicationInterface::serve_evaluations_synch_peer().

**void stop_evaluation_servers()** [protected], [virtual]

used by the iterator master to terminate evaluation servers

This code is executed on the iteratorComm rank 0 processor when iteration on a particular model is complete. It sends a termination signal (tag = 0 instead of a valid fn_eval_id) to each of the slave analysis servers. NOTE: This function is called from the Strategy layer even when in serial mode. Therefore, use iteratorCommSize to provide appropriate fall through behavior.

Reimplemented from Interface.

References ParallelLibrary::bcast_e(), ParallelLibrary::free(), ParallelConfiguration::ie_parallel_level(), Interface::ieDedMasterFlag, ParallelLibrary::isend(ie()), ApplicationInterface::iteratorCommSize, Interface::multiProcEvalFlag, ApplicationInterface::numEvalServers, Interface::outputLevel, ParallelLibrary::parallel_configuration(), and ApplicationInterface::parallelLib.

**void init_communicators_checks (int max_eval_concurrency)** [protected], [virtual]

perform construct-time error checks on the parallel configuration

Override DirectApplicInterface definition if plug-in to allow batch processing in Plugin{Serial,Parallel}DirectApplicInterface.cpp

Reimplemented in DirectApplicInterface, ProcessHandleApplicInterface, and SysCallApplicInterface.

Referenced by ApplicationInterface::init_communicators().

**void set_communicators_checks (int max_eval_concurrency)** [protected], [virtual]

perform run-time error checks on the parallel configuration

Override DirectApplicInterface definition if plug-in to allow batch processing in Plugin{Serial,Parallel}DirectApplicInterface.cpp

Reimplemented in DirectApplicInterface, SerialDirectApplicInterface, ParallelDirectApplicInterface, ProcessHandleApplicInterface, and SysCallApplicInterface.

Referenced by ApplicationInterface::set_communicators().

**void master_dynamic_schedule_analyses()** [protected]

blocking dynamic schedule of all analyses within a function evaluation using message passing

This code is called from derived classes to provide the master portion of a master-slave algorithm for the dynamic scheduling of analyses among slave servers. It is patterned after master_dynamic_schedule_evaluations(). It performs no analyses locally and matches either serve_analyses_synch() or serve_analyses_asynch() on the slave
servers, depending on the value of `asynchLocalAnalysisConcurrency`. Dynamic scheduling assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to `asynchLocalAnalysisConcurrency`). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within `ParallelLibrary`.

References `ApplicationInterface::asynchLocalAnalysisConcurrency`, `ParallelLibrary::free()`, `ParallelLibrary::irecv()`, `ParallelLibrary::isend()`, `ApplicationInterface::numAnalysisDrivers`, `ApplicationInterface::numAnalysisServers`, `ApplicationInterface::parallelLib`, `ParallelLibrary::waitall()`, and `ParallelLibrary::waitsome()`.

Referenced by `ProcessHandleApplicInterface::create_evaluation_process()`, `SysCallApplicInterface::create_evaluation_process()`, and `DirectApplicInterface::derived_map()`.

```c
void serve_analyses_synch() [protected]
```

serve the master analysis scheduler and manage one synchronous analysis job at a time

This code is called from derived classes to run synchronous analyses on slave processors. The slaves receive requests (blocking receive), do local derived_map_ac’s, and return codes. This is done continuously until a termination signal is received from the master. It is patterned after `serve_evaluations_synch()`.

References `ApplicationInterface::analysisCommRank`, `ParallelLibrary::bcast()`, `ParallelLibrary::isend()`, `ApplicationInterface::multiProcAnalysisFlag`, `ApplicationInterface::parallelLib`, `ParallelLibrary::recv()`, `ApplicationInterface::synchronous_local_analysis()`, and `ParallelLibrary::wait()`.

Referenced by `ProcessHandleApplicInterface::create_evaluation_process()`, `SysCallApplicInterface::create_evaluation_process()`, and `DirectApplicInterface::derived_map()`.

```c
bool duplication_detect(const Variables &vars, Response &response, bool asynch_flag) [private]
```

checks `data_pairs` and `beforeSynchCorePRPQueue` to see if the current evaluation request has already been performed or queued

Called from `map()` to check incoming evaluation request for duplication with content of `data_pairs` and `beforeSynchCorePRPQueue`. If duplication is detected, return true, else return false. Manage bookkeeping with `historyDuplicateMap` and `beforeSynchDuplicateMap`. Note that the list searches can get very expensive if a long list is searched on every new function evaluation (either from a large number of previous jobs, a large number of pending jobs, or both). For this reason, a user request for deactivation of the evaluation cache results in a complete bypass of `duplication_detect()`, even though a `beforeSynchCorePRPQueue` search would still be meaningful. Since the intent of this request is to streamline operations, both list searches are bypassed.

References `Response::active_set()`, `ApplicationInterface::beforeSynchCorePRPQueue`, `ApplicationInterface::beforeSynchDuplicateMap`, `Response::copy()`, `Dakota::data_pairs`, `ParamResponsePair::eval_id()`, `Interface::evalIdCntr`, `ApplicationInterface::historyDuplicateMap`, `Interface::interfaceId`, `Dakota::lookup_by_val()`, `ApplicationInterface::nearbyDuplicateDetect`, `ApplicationInterface::nearbyTolerance`, and `Response::update()`.

Referenced by `ApplicationInterface::map()`.

```c
void init_default_asv(size_t num_fns) [private]
```

initialize default ASV if needed; this is done at run time due to post-construct time `Response` size changes.

If the user has specified `active_set_vector` as off, then `map()` uses a default ASV which is constant for all function evaluations (so that the user need not check the content of the ASV on each evaluation). Only initialized if needed and not already sized.

References `ApplicationInterface::asvControlFlag`, `ApplicationInterface::defaultASV`, `ApplicationInterface::gradientType`, `ApplicationInterface::gradMixedAnalyticIds`, `ApplicationInterface::hessianType`, and `ApplicationInterface::hessMixedAnalyticIds`.

Referenced by `ApplicationInterface::map()`.
void master_dynamic_schedule_evaluations( ) [private]

blocking dynamic schedule of all evaluations in beforeSynchCorePRPQueue using message passing on a dedicated master partition; executes on iteratorComm master

This code is called from synchronize() to provide the master portion of a master-slave algorithm for the dynamic scheduling of evaluations among slave servers. It performs no evaluations locally and matches either serve_evaluations_synch() or serve_evaluations_asynch() on the slave servers, depending on the value of asynchLocalEvalConcurrency. Dynamic scheduling assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to asynchLocalEvalConcurrency). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed and returned. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within ParallelLibrary::peer.

References

Referenced by ApplicationInterface::synchronize().

void peer_static_schedule_evaluations( ) [private]

blocking static schedule of all evaluations in beforeSynchCorePRPQueue using message passing on a peer partition; executes on iteratorComm master

This code runs on the iteratorCommRank 0 processor (the iterator) and is called from synchronize() in order to manage a static schedule for cases where peer 1 must block when evaluating its local job allocation (e.g., single or multiprocessor direct interface evaluations). It matches serve_evaluations_peer() for any other processors within the first evaluation partition and serve_evaluations_{synch,asynch}() for all other evaluation partitions (depending on asynchLocalEvalConcurrency). It performs function evaluations locally for its portion of the job allocation using either asynchronous_local_evaluations() or synchronous_local_evaluations(). Single-level and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within ParallelLibrary. The iteratorCommRank 0 processor assigns the static schedule since it is the only processor with access to beforeSynchCorePRPQueue (it runs the iterator and calls synchronize). The alternate design of each peer selecting its own jobs using the modulus operator would be applicable if execution of this function (and therefore the job list) were distributed.

Referenced by ApplicationInterface::synchronize().

void peer_dynamic_schedule_evaluations( ) [private]

blocking dynamic schedule of all evaluations in beforeSynchCorePRPQueue using message passing on a peer partition; executes on iteratorComm master

This code runs on the iteratorCommRank 0 processor (the iterator) and is called from synchronize() in order to manage a dynamic schedule, as enabled by nonblocking management of local asynchronous jobs. It matches serve_evaluations_{synch,asynch}() for other evaluation partitions, depending on asynchLocalEvalConcurrency; it does not match serve_evaluations_peer() since, for local asynchronous jobs, the first evaluation partition cannot be multiprocessor. It performs function evaluations locally for its portion of the job allocation using asynchronous_local_evaluations_nowait(). Single-level and multilevel parallel use intra- and inter-communicators, respectively,
for send/receive. Specific syntax is encapsulated within ParallelLibrary.

References ApplicationInterface::assign_asynch_local_queue(), ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::msgPassRunningMap, ApplicationInterface::numEvalServers, Interface::outputLevel, ApplicationInterface::recvBuffers, ApplicationInterface::recvRequests, ApplicationInterface::send_evaluation(), ApplicationInterface::sendBuffers, ApplicationInterface::test_local_backfill(), ApplicationInterface::test_receives_backfill(), ApplicationInterface::test_local_backfill().

Referenced by ApplicationInterface::synchronize().

void asynchronous_local_evaluations ( PRPQueue & local_prp_queue ) [private]
perform all jobs in prp_queue using asynchronous approaches on the local processor.
This function provides blocking synchronization for the local asynch case (background system call, nonblocking fork, or threads). It can be called from synchronize() for a complete local scheduling of all asynchronous jobs or from peer_{static,dynamic}_schedule_evaluations() to perform a local portion of the total job set. It uses derived_map_asynch() to initiate asynchronous evaluations and wait_local_evaluations() to capture completed jobs, and mirrors the master_dynamic_schedule_evaluations() message passing scheduler as much as possible (wait_local_evaluations() is modeled after MPI_Waitsome()).

References ApplicationInterface::assign_asynch_local_queue(), ApplicationInterface::asynchLocalActivePRPQueue, ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::asynchLocalEvalStatic, ApplicationInterface::completionSet, ApplicationInterface::launch_asynch_local(), ApplicationInterface::localServerAssigned, Dakota::lookup_by_eval_id(), ApplicationInterface::numEvalServers, Interface::outputLevel, ApplicationInterface::process_asynch_local(), Interface::rawResponseMap, and ApplicationInterface::wait_local_evaluations().

Referenced by ApplicationInterface::peer_static_schedule_evaluations(), and ApplicationInterface::synchronize().

void synchronous_local_evaluations ( PRPQueue & local_prp_queue ) [private]
perform all jobs in prp_queue using synchronous approaches on the local processor.
This function provides blocking synchronization for the local synchronous case (foreground system call, blocking fork, or procedure call from derived_map()). It is called from peer_{static,dynamic}_schedule_evaluations() to perform a local portion of the total job set.

References ApplicationInterface::broadcast_evaluation(), Interface::currEvalId, ApplicationInterface::derived_map(), ApplicationInterface::manage_failure(), Interface::multiProcEvalFlag, and ApplicationInterface::process_synch_local().

Referenced by ApplicationInterface::peer_static_schedule_evaluations(), and ApplicationInterface::peer_static_schedule_evaluations_nowait().

void master_dynamic_schedule_evaluations_nowait ( ) [private]
execute a nonblocking dynamic schedule in a master-slave partition.
This code is called from synchronize_nowait() to provide the master portion of a nonblocking master-slave algorithm for the dynamic scheduling of evaluations among slave servers. It performs no evaluations locally and matches either serve_evaluations_synch() or serve_evaluations_asynch() on the slave servers, depending on the value of asynchLocalEvalConcurrency. Dynamic scheduling assigns jobs in 2 passes. The 1st pass gives each server the same number of jobs (equal to asynchLocalEvalConcurrency). The 2nd pass assigns the remaining jobs to slave servers as previous jobs are completed. Single- and multilevel parallel use intra- and inter-communicators, respectively, for send/receive. Specific syntax is encapsulated within ParallelLibrary.

References Dakota::abort_handler(), ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::headerFlag, ApplicationInterface::msgPassRunningMap, ApplicationInterface::numEvalServers, ApplicationInterface::recvBuffers, ApplicationInterface::recvRequests, ApplicationInterface::send_evaluation(), ApplicationInterface::sendBuffers, and ApplicationInterface::test_receives_backfill().
void peer_static_schedule_evaluations_nowait( ) [private]
execute a nonblocking static schedule in a peer partition

This code runs on the iteratorCommRank 0 processor (the iterator) and is called from synchronize_nowait() in order to manage a nonblocking static schedule. It matches serve_evaluations_nowait() for other evaluation partitions (asynchLocalEvalConcurrency == 1). It performs blocking local function evaluations, one at a time, for its portion of the static schedule and checks for remote completions in between each local completion. Therefore, unlike peer_dynamic_schedule_evaluations_nowait(), this scheduler will always return at least one job. Single-level and multilevel parallel use intra- and inter-communicators, respectively, for send/receive, with specific syntax as encapsulated within ParallelLibrary. The iteratorCommRank 0 processor assigns the static schedule since it is the only processor with access to beforeSynchCorePRPQueue (it runs the iterator and calls synchronize). The alternate design of each peer selecting its own jobs using the modulus operator would be applicable if execution of this function (and therefore the job list) were distributed.

Referenced by ApplicationInterface::synchronize_nowait().

void peer_dynamic_schedule_evaluations_nowait( ) [private]
execute a nonblocking dynamic schedule in a peer partition

This code runs on the iteratorCommRank 0 processor (the iterator) and is called from synchronize_nowait() in order to manage a nonblocking dynamic schedule. It matches serve_evaluations_{synch,asynch}() for other evaluation partitions (depending on asynchLocalEvalConcurrency). It performs nonblocking local function evaluations for its portion of the static schedule using asynchronous_local_evaluations(). Single-level and multilevel parallel use intra- and inter-communicators, respectively, for send/receive, with specific syntax as encapsulated within ParallelLibrary. The iteratorCommRank 0 processor assigns the dynamic schedule since it is the only processor with access to beforeSynchCorePRPQueue (it runs the iterator and calls synchronize). The alternate design of each peer selecting its own jobs using the modulus operator would be applicable if execution of this function (and therefore the job list) were distributed.

References Dakota::abort_handler(), ApplicationInterface::assign_asynch_local_queue(), ApplicationInterface::assign_asynch_local_queue_nowait(), ApplicationInterface::asynchLocalActivePRPQueue, ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::beforeSynchCorePRPQueue, ApplicationInterface::headerFlag, Dakota::lookup_by_eval_id(), ApplicationInterface::msgPassRunningMap, ApplicationInterface::numEvalServers, ApplicationInterface::recvBuffers, ApplicationInterface::recvRequests, ApplicationInterface::send_evaluation(), ApplicationInterface::sendBuffers, ApplicationInterface::test_local_backfill(), and ApplicationInterface::test_receives_backfill().

Referenced by ApplicationInterface::synchronize_nowait().

void asynchronous_local_evaluations_nowait( PRPQueue & local_prp_queue ) [private]
launch new jobs in prp_queue asynchronously (if capacity is available), perform nonblocking query of all running jobs, and process any completed jobs (handles both local master- and local peer-scheduling cases)
This function provides nonblocking synchronization for the local asynch case (background system call, non-blocking fork, or threads). It is called from `synchronize_nowait()` and passed the complete set of all asynchronous jobs (beforeSynchCorePRPQueue). It uses `derived_map_asynch()` to initiate asynchronous evaluations and `test_local_evaluations()` to capture completed jobs in nonblocking mode. It mirrors a nonblocking message passing scheduler as much as possible (test_local_evaluations() modeled after MPI_Testsome()). The result of this function is rawResponseMap, which uses eval_id as a key. It is assumed that the incoming local_prp_queue contains only active and new jobs - i.e., all completed jobs are cleared by `synchronize_nowait()`.

Also supports asynchronous local evaluations with static scheduling. This scheduling policy specifically ensures that a completed asynchronous evaluation eval_id is replaced with an equivalent one, modulo asynchLocal-EvalConcurrency. In the nowait case, this could render some servers idle if evaluations don’t come in eval_id order or some evaluations are cancelled by the caller in between calls. If this function is called with unlimited local eval concurrency, the static scheduling request is ignored.

References ApplicationInterface::assign_asynch_local_queue_nowait(), ApplicationInterface::asynchLocalActive-PRPQueue, ApplicationInterface::asynchLocalEvalConcurrency, ApplicationInterface::asynchLocalEvalStatic, ApplicationInterface::headerFlag, and ApplicationInterface::test_local_backfill().

Referenced by ApplicationInterface::synchronize_nowait().

```cpp
void serve_evaluations_synch() [private]
```

serve the evaluation message passing schedulers and perform one synchronous evaluation at a time

This code is invoked by serve_evaluations() to perform one synchronous job at a time on each slave/peer server. The servers receive requests (blocking receive), do local synchronous maps, and return results. This is done continuously until a termination signal is received from the master (sent via stop_evaluation_servers()).

References Dakota::array_write.annotated(), ParallelLibrary::bcast_e(), Interface::currEvalId, ApplicationInterface::derived_map(), ApplicationInterface::evalCommRank, ParallelLibrary::isend_ie(), ApplicationInterface::lenResponseMessage, ApplicationInterface::lenVarsActSetMessage, ApplicationInterface::manage_failure(), Interface::multi-ProcEvalFlag, ApplicationInterface::parallelLib, ParallelLibrary::recv_ie(), MPIPackBuffer::reset(), ApplicationInterface::sharedRespData, and ParallelLibrary::wait().

Referenced by ApplicationInterface::serve_evaluations().

```cpp
void serve_evaluations_synch_peer() [private]
```

serve the evaluation message passing schedulers and perform one synchronous evaluation at a time as part of the 1st peer

This code is invoked by serve_evaluations() to perform a synchronous evaluation in coordination with the iteratorCommRank 0 processor (the iterator) for static schedules. The bcast() matches either the bcast() in synchronous_local_evaluations(), which is invoked by peer_static_schedule_evaluations(), or the bcast() in map().

References Dakota::array_write.annotated(), ParallelLibrary::bcast_e(), Interface::currEvalId, ApplicationInterface::derived_map(), ApplicationInterface::lenVarsActSetMessage, ApplicationInterface::manage_failure(), ApplicationInterface::parallelLib, and ApplicationInterface::sharedRespData.

Referenced by ApplicationInterface::serve_evaluations().

```cpp
void serve_evaluations_asynch() [private]
```

serve the evaluation message passing schedulers and manage multiple asynchronous evaluations

This code is invoked by serve_evaluations() to perform multiple asynchronous jobs on each slave/peer server. The servers test for any incoming jobs, launch any new jobs, process any completed jobs, and return any results. Each of these components is nonblocking, although the server loop continues until a termination signal is received from the master (sent via stop_evaluation_servers()). In the master-slave case, the master maintains the correct
number of jobs on each slave. In the static scheduling case, each server is responsible for limiting concurrency (since the entire static schedule is sent to the peers at start up).

References Dakota::abort_handler(), ApplicationInterface::asynchLocalActivePRPQueue, ApplicationInterface::asynchLocalEvalConcurrency, ParallelLibrary::bcast_e(), ApplicationInterface::completionSet, ApplicationInterface::derived_map_asynch(), ApplicationInterface::evalCommRank, Interface::interfaceId, ParallelLibrary::irecv_ie(), ApplicationInterface::lenResponseMessage, ApplicationInterface::lenVarsActSetMessage, Dakota::lookup_by_eval_id(), Interface::multiProcEvalFlag, ApplicationInterface::parallelLib, ParallelLibrary::recv_ie(), MPIUnpackBuffer::reset(), ParallelLibrary::send_ie(), ApplicationInterface::sharedRespData, ParallelLibrary::test(), and ApplicationInterface::test_local_evaluations().

Referenced by ApplicationInterface::serve_evaluations().

void serve_evaluations_asynch_peer() [private]

serve the evaluation message passing schedulers and perform multiple asynchronous evaluations as part of the 1st peer

This code is invoked by serve_evaluations() to perform multiple asynchronous jobs on multiprocessor slave/peer servers. It matches the multiProcEvalFlag bcasts in ApplicationInterface::asynchronous_local_evaluations().

References Dakota::abort_handler(), ApplicationInterface::asynchLocalActivePRPQueue, ApplicationInterface::asynchLocalEvalConcurrency, ParallelLibrary::bcast_e(), ApplicationInterface::completionSet, ApplicationInterface::derived_map_asynch(), Interface::interfaceId, ApplicationInterface::lenVarsActSetMessage, Dakota::lookup_by_eval_id(), ApplicationInterface::parallelLib, MPIUnpackBuffer::reset(), ApplicationInterface::sharedRespData, and ApplicationInterface::test_local_evaluations().

Referenced by ApplicationInterface::serve_evaluations().

  alternate constructor

- **Approximation (const Approximation &approx)**
  
  copy constructor
• virtual ~Approximation ()
  destructor
• Approximation operator= (const Approximation &approx)
  assignment operator
• virtual void build ()
  builds the approximation from scratch
• virtual void export_model (const String &fn_label="", const String &export_prefix="", const unsigned short export_format=NO_MODEL_FORMAT)
  exports the approximation
• virtual void rebuild ()
  rebuilds the approximation incrementally
• virtual void pop_coefficients (bool save_data)
  removes entries from end of SurrogateData::{vars,resp}Data (last points appended, or as specified in args)
• virtual void push_coefficients ()
  restores state prior to previous pop()
• virtual void finalize_coefficients ()
  finalize approximation by applying all remaining trial sets
• virtual void clear_current_active_data ()
  clear current build data in preparation for next build
• virtual void combine_coefficients ()
  combine all level approximations into a single aggregate approximation
• virtual void combined_to_active_coefficients (bool clear_combined=true)
  promote combined approximation into active approximation
• virtual void clear_inactive_coefficients ()
  prune inactive coefficients following combination and promotion to active
• virtual Real value (const Variables &vars)
  retrieve the approximate function value for a given parameter vector
• virtual const RealVector & gradient (const Variables &vars)
  retrieve the approximate function gradient for a given parameter vector
• virtual const RealSymMatrix & hessian (const Variables &vars)
  retrieve the approximate function Hessian for a given parameter vector
• virtual Real prediction_variance (const Variables &vars)
  retrieve the variance of the predicted value for a given parameter vector
• virtual Real value (const RealVector &c_vars)
  retrieve the approximate function value for a given parameter vector
• virtual const RealVector & gradient (const RealVector &c_vars)
  retrieve the approximate function gradient for a given parameter vector
• virtual const RealSymMatrix & hessian (const RealVector &c_vars)
  retrieve the approximate function Hessian for a given parameter vector
• virtual Real prediction_variance (const RealVector &c_vars)
  retrieve the variance of the predicted value for a given parameter vector
• virtual bool diagnostics_available ()
  check if diagnostics are available for this approximation type
• virtual Real diagnostic (const String &metric_type)
  retrieve a single diagnostic metric for the diagnostic type specified
• virtual RealArray cv_diagnostics (const StringArray &metric_types, unsigned num_folds)
  retrieve diagnostic metrics for the diagnostic types specified, applying
• virtual void primary_diagnostics (int fn_index)
  compute and print all requested diagnostics and cross-validation
• virtual RealArray challenge_diagnostics (const StringArray &metric_types, const RealMatrix &challenge_points, const RealVector &challenge_responses)
  compute requested diagnostics for user provided challenge pts
• virtual void challenge_diagnostics (int fn_index, const RealMatrix &challenge_points, const RealVector &challenge_responses)
  compute and print all requested diagnostics for user provided challenge pts
• virtual RealVector approximation_coefficients (bool normalized) const
  return the coefficient array computed by build()/rebuild()
• virtual void approximation_coefficients (const RealVector &approx_coeffs, bool normalized)
  set the coefficient array from external sources, rather than computing with build()/rebuild()
• virtual void link_multilevel_surrogate_data ()
  link more than once approxData instance for aggregated response data (PecosApproximation)
• virtual void coefficient_labels (std::vector<std::string> &coeff_labels) const
  print the coefficient array computed in build()/rebuild()
• virtual void print_coefficients (std::ostream &s, bool normalized)
  print the coefficient array computed in build()/rebuild()
• virtual int min_coefficients () const
  return the minimum number of samples (unknowns) required to build the derived class approximation type in numVars dimensions
• virtual int recommended_coefficients () const
  return the recommended number of samples (unknowns) required to build the derived class approximation type in numVars dimensions
• virtual int num_constraints () const
  return the number of constraints to be enforced via an anchor point
• int min_points (bool constraint_flag) const
  return the minimum number of points required to build the approximation type in numVars dimensions. Uses min_coefficients() and num_constraints().
• int recommended_points (bool constraint_flag) const
  return the recommended number of samples to build the approximation type in numVars dimensions (default same as min_points)
• void pop_data (bool save_data)
  removes entries from end of SurrogateData::{vars,resp}Data (last points appended, or as specified in args)
• void push_data ()
  restores SurrogateData state prior to previous pop()
• void finalize_data ()
  finalize SurrogateData by applying all remaining trial sets
• const Pecos::SurrogateData & surrogate_data () const
  return approxData[sharedDataRep->activeDataIndex]
• const Pecos::SurrogateData & surrogate_data (size_t d_index) const
  return approxData[d_index]
• void add (const Pecos::SurrogateDataVars &sdv, bool anchor_flag, bool deep_copy, size_t key_index=NP-OS)
  append to SurrogateData::varsData
• void add (const Variables &vars, bool anchor_flag, bool deep_copy, size_t key_index=NPOS)
  extract the relevant vectors from Variables and invoke add(RealVector&, IntVector&, RealVector&)
• void add (const RealVector &c_vars, const IntVector &di_vars, const RealVector &dr_vars, bool anchor_flag, bool deep_copy, size_t key_index=NPPOS)
  adds a new data point by appending to SurrogateData::varsData
• void add (const Pecos::SurrogateDataResp &sdr, bool anchor_flag, bool deep_copy, size_t key_index=NP-OS)
  append to SurrogateData::respData
• void add (const Response &response, int fn_index, bool anchor_flag, bool deep_copy, size_t key_index=NPOS)
  adds a new data point by appending to SurrogateData::respData
• void add_array (const RealMatrix &sample_vars, const RealVector &sample_resp, bool deep_copy=true, size_t key_index=NPOS)
  add surrogate data from the provided sample and response data, assuming continuous variables and function values only
• void pop_count (size_t count, size_t key_index)
  appends to SurrogateData::popCountStack (number of entries to pop from end of SurrogateData::{vars,resp}Data, based on size of last data append)
• void active_model_key (const UShortArray &sd_key)
  activate an approximation state based on its multi-index key
• void clear_model_keys ()
  reset initial state by removing all model keys for an approximation
• void clear_data ()
  clear SurrogateData::{vars,resp}Data for all approxDataKeys
• void clear_active_data ()
  clear active approximation data
• void clear_inactive_data ()
  clear inactive approximation data
• void clear_active_popped ()
  clear SurrogateData::popped{Vars,Resp}Trials, popCountStack for active key
• void clear_popped ()
  clear SurrogateData::popped{Vars,Resp}Trials, popCountStack for all keys
• void set_bounds (const RealVector &c_l_bnds, const RealVector &c_u_bnds, const IntVector &di_l_bnds, const IntVector &di_u_bnds, const RealVector &dr_l_bnds, const RealVector &dr_u_bnds)
  set approximation lower and upper bounds (currently only used by graphics)
• Approximation * approx_rep () const
  returns approxRep for access to derived class member functions that are not mapped to the top Approximation level
**Protected Member Functions**

- **Approximation** (BaseConstructor, const ProblemDescDB &problem_db, const SharedApproxData &shared_data, const String &approx_label)
  
  constructor initializes the base class part of letter classes (*BaseConstructor* overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- **Approximation** (NoDBBaseConstructor, const SharedApproxData &shared_data)
  
  constructor initializes the base class part of letter classes (*BaseConstructor* overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- void **check_points** (size_t num_build_pts)
  
  Check number of build points against minimum required.

**Protected Attributes**

- RealVector **approxGradient**
  
  gradient of the approximation returned by *gradient()*

- RealSymMatrix **approxHessian**
  
  Hessian of the approximation returned by *hessian()*

- String **approxLabel**
  
  label for approximation, if applicable

- std::vector<Pecos::SurrogateData> **approxData**
  
  contains the variables/response data for constructing a single approximation model (one response function). Typically there is only one SurrogateData instance per Approximation, although SurrogateModels in AGGREGATED_MODELS mode require two instances.

- SharedApproxData * **sharedDataRep**
  
  contains the approximation data that is shared among the response set

**Private Member Functions**

- Approximation * **get_approx** (ProblemDescDB &problem_db, const SharedApproxData &shared_data, const String &approx_label)
  
  Used only by the standard envelope constructor to initialize approxRep to the appropriate derived type.

- Approximation * **get_approx** (const SharedApproxData &shared_data)
  
  Used only by the alternate envelope constructor to initialize approxRep to the appropriate derived type.

**Private Attributes**

- Approximation * **approxRep**
  
  pointer to the letter (initialized only for the envelope)

- int **referenceCount**
  
  number of objects sharing approxRep
13.7.1 Detailed Description

Base class for the approximation class hierarchy.

The Approximation class is the base class for the response data fit approximation class hierarchy in DAKOTA. One instance of an Approximation must be created for each function to be approximated (a vector of Approximations is contained in ApproximationInterface). For memory efficiency and enhanced polymorphism, the approximation hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Approximation) serves as the envelope and one of the derived classes (selected in Approximation::get_approx()) serves as the letter.

13.7.2 Constructor & Destructor Documentation

Approximation ( )
default constructor

The default constructor is used in Array<Approximation> instantiations and by the alternate envelope constructor. approxRep is NULL in this case (problem_db is needed to build a meaningful Approximation object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

Approximation ( ProblemDescDB & problem_db, const SharedApproxData & shared_data, const String & approx_label )
standard constructor for envelope

Envelope constructor only needs to extract enough data to properly execute get_approx, since Approximation(BaseConstructor, problem_db) builds the actual base class data for the derived approximations.

References Dakota::abort_handler(), Approximation::approxRep, and Approximation::get_approx().

Approximation ( const SharedApproxData & shared_data )
alternate constructor

This is the alternate envelope constructor for instantiations on the fly. Since it does not have access to problem_db, it utilizes the NoDBBaseConstructor constructor chain.

References Dakota::abort_handler(), Approximation::approxRep, and Approximation::get_approx().

Approximation ( const Approximation & approx )
copy constructor

Copy constructor manages sharing of approxRep and incrementing of referenceCount.

References Approximation::approxRep, and Approximation::referenceCount.

~Approximation ( ) [virtual]
destructor

Destructor decrements referenceCount and only deletes approxRep when referenceCount reaches zero.

References Approximation::approxRep, and Approximation::referenceCount.

Approximation ( BaseConstructor, const ProblemDescDB & problem_db, const SharedApproxData & shared_data, const String & approx_label ) [protected]

constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
This constructor is the one which must build the base class data for all derived classes. get\_approx() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling get\_approx() again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Approximation).

References Approximation::approxData.

**Approximation ( NoDBBaseConstructor , const SharedApproxData & shared data ) [protected]**

This constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

This constructor is the one which must build the base class data for all derived classes. get\_approx() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling get\_approx() again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Approximation).

References Approximation::approxData.

### 13.7.3 Member Function Documentation

**Approximation operator= ( const Approximation & approx )**

Assignment operator

References Approximation::approxRep, and Approximation::referenceCount.

**void build ( ) [virtual]**

builds the approximation from scratch

This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented in PecosApproximation, VPSApproximation, GaussProcApproximation, SurfpackApproximation, TaylorApproximation, QMEApproximation, and TANA3Approximation.

References Approximation::approxData, Approximation::approxRep, Approximation::build(), and Approximation::check\_points().

Referenced by QMEApproximation::build(), TANA3Approximation::build(), TaylorApproximation::build(), Approximation::build(), SurfpackApproximation::build(), GaussProcApproximation::build(), VPSApproximation::build(), and Approximation::rebuild().

**void clear\_current\_active\_data ( ) [inline],[virtual]**

clear current build data in preparation for next build

Clear current but preserve hisory for active key (virtual function redefined by \{TANA3,QMEA\}Approximation to demote current while preserving previous points).

Reimplemented in QMEApproximation, and TANA3Approximation.

References Approximation::approxRep, Approximation::clear\_active\_data(), and Approximation::clear\_current\_active\_data().

Referenced by Approximation::clear\_current\_active\_data().
**void add_array** ( const RealMatrix & *sample* vars, const RealVector & *sample* resp, bool *deep_copy* = true, size_t *key_index* = NPOS )

add surrogate data from the provided sample and response data, assuming continuous variables and function values only

- Short cut function (not used by ApproximationInterface).
- References Dakota::abort_handler(), Approximation::add(), Approximation::add_array(), and Approximation::approxRep.
- Referenced by Approximation::add_array().

**void clear_data ( ) [inline]**

clear SurrogateData::{vars,resp}Data for all approxDataKeys

- Clears out current + history for each tracked key (not virtual).
- References Approximation::approxData, Approximation::approxRep, and Approximation::clear_data().
- Referenced by Approximation::clear_data().

**Approximation * get_approx** ( ProblemDescDB & *problem_db*, const SharedApproxData & *shared_data*, const String & *approx_label* ) [private]

Used only by the standard envelope constructor to initialize approxRep to the appropriate derived type.

- Used only by the envelope constructor to initialize approxRep to the appropriate derived type.
- References SharedApproxData::approxType, SharedApproxData::data_rep(), ProblemDescDB::get_bool(), and Dakota::strends().
- Referenced by Approximation::Approximation().

**Approximation * get_approx** ( const SharedApproxData & *shared_data* ) [private]

Used only by the alternate envelope constructor to initialize approxRep to the appropriate derived type.

- Used only by the envelope constructor to initialize approxRep to the appropriate derived type.
- References SharedApproxData::approxType, SharedApproxData::data_rep(), and Dakota::strends().
- The documentation for this class was generated from the following files:
  
  - DakotaApproximation.hpp
  - DakotaApproximation.cpp

### 13.8 ApproximationInterface Class Reference

Derived class within the interface class hierarchy for supporting approximations to simulation-based results.

Inheritance diagram for ApproximationInterface:

```
    Interface
     |___ ApproximationInterface
```
13.8. APPROXIMATIONINTERFACE CLASS REFERENCE

Public Member Functions

- **ApproximationInterface** (ProblemDescDB &problem_db, const Variables &am_vars, bool am_cache, const String &am_interface_id, const StringArray &fn_labels)
  primary constructor

- **ApproximationInterface** (const String &approx_type, const UShortArray &approx_order, const Variables &am_vars, bool am_cache, const String &am_interface_id, size_t num_fns, short data_order, short output_level)
  alternate constructor for instantiations on the fly

- ∼ApproximationInterface ()
  destructor

Protected Member Functions

- void **map** (const Variables &vars, const ActiveSet &set, Response &response, bool asynch_flag=false)
  the function evaluator: provides an approximate "mapping" from the variables to the responses using function-Surfaces

- int **minimum_points** (bool constraint_flag) const
  returns the minimum number of samples required to build the functionSurfaces

- int **recommended_points** (bool constraint_flag) const
  returns the recommended number of samples recommended to build the functionSurfaces

- void **active_model_key** (const UShortArray &key)
  activate an approximation state based on its multi-index key

- void **clear_model_keys** ()
  reset initial state by removing all model keys for an approximation

- void **surrogate_model_key** (const UShortArray &key)
  assign key for the surrogate model within a {truth,surrogate} pairing

- void **truth_model_key** (const UShortArray &key)
  assign key for the truth model within a {truth,surrogate} pairing

- void **approximation_function_indices** (const IntSet &approx_fn_indices)
  set the (currently active) approximation function index set

- void **link_multilevel_approximation_data** ()
  link together more than one SurrogateData instance within an ApproximationInterface

- void **update_approximation** (const Variables &vars, const IntResponsePair &response_pr)

- void **update_approximation** (const RealMatrix &samples, const IntResponseMap &resp_map)

- void **append_approximation** (const VariablesArray &vars_array, const IntResponseMap &resp_map)

- void **append_approximation** (const RealMatrix &samples, const IntResponsePair &resp_pr)

- void **append_approximation** (const Variables &vars, const IntResponseMap &resp_map)

- void **build_approximation** (const RealVector &c_l_bnds, const RealVector &c_u_bnds, const IntVector &d_l_bnds, const IntVector &d_u_bnds)

- void **export_approximation** ()

- void **rebuild_approximation** (const BoolDeque &rebuild_deque)

- void **pop_approximation** (bool save_data)

- void **push_approximation** ()

- bool **push_available** ()
queries the approximation for the ability to retrieve a previous increment

• void finalize_approximation ()
  finalizes the approximation by applying all trial increments

• void combine_approximation ()
  combine the current approximation with previously stored data sets

• void combined_to_active (bool clear_combined=true)
  promote the combined approximation to the currently active one

• void clear_inactive ()
  clear inactive approximation data

• void clear_current_active_data ()
  clears current data from an approximation interface

• void clear_active_data ()
  clears all data from an approximation interface

• SharedApproxData & shared_approximation ()
  retrieve the SharedApproxData within an ApproximationInterface

• std::vector<Approximation> & approximations ()
  retrieve the Approximations within an ApproximationInterface

• const Pecos::SurrogateData & approximation_data (size_t fn_index, size_t d_index=_NPOS)
  retrieve the approximation data from a particular Approximation within an ApproximationInterface

• const RealVectorArray & approximation_coefficients (bool normalized=false)
  retrieve the approximation coefficients from each Approximation within an ApproximationInterface

• void approximation_coefficients (const RealVectorArray &approx_coeffs, bool normalized=false)
  set the approximation coefficients within each Approximation within an ApproximationInterface

• const RealVector & approximation_variances (const Variables &vars)
  retrieve the approximation variances from each Approximation within an ApproximationInterface

• Real2DArray cv_diagnostics (const StringArray &metrics, unsigned num_folds)
  approximation cross-validation quality metrics per response function

• Real2DArray challenge_diagnostics (const StringArray &metric_types, const RealMatrix &challenge_pts, const RealVector &challenge_resps)
  recover data from a series of asynchronous evaluations (blocking)

• const IntResponseMap & synchronize ()
  recover data from a series of asynchronous evaluations (nonblocking)

Private Member Functions

• void mixed_add (const Variables &vars, const Response &response, bool anchor)
  add variables/response data to functionSurfaces using a mixture of shallow and deep copies

• void mixed_add (const Real *c_vars, const Response &response, bool anchor)
  add variables/response data to functionSurfaces using a mixture of shallow and deep copies

• void shallow_add (const Variables &vars, const Response &response, bool anchor)
  add variables/response data to functionSurfaces using a shallow copy

• void sample_to_variables (const Real *sample_c_vars, size_t num_cv, Variables &vars)
  populate continuous variables within vars from sample_c_vars
• **void update_pop_counts** (const IntResponsePair &response_pr)
  append to the stack of pop counts within each of the functionSurfaces based on the active set definition within a single incoming response

• **void update_pop_counts** (const IntResponseMap &resp_map)
  append to the stack of pop counts within each of the functionSurfaces based on the active set definitions within a map of incoming responses

• **void restore_data_key** ()
  following add() and pop_count() operations which may enumerate multiple keys, restore the active approxData to the nominal key

• **void read_challenge_points** (bool active_only)
  Load approximation test points from user challenge points file.

**Private Attributes**

• IntSet approxFnIndices
  for incomplete approximation sets, this array specifies the response function subset that is approximated

• SharedApproxData sharedData
  data that is shared among all functionSurfaces

• std::vector< Approximation > functionSurfaces
  list of approximations, one per response function

• RealVectorArray functionSurfaceCoeffs
  array of approximation coefficient vectors, one per response function

• RealVector functionSurfaceVariances
  vector of approximation variances, one value per response function

• String challengeFile
  data file for user-supplied challenge data (per interface, since may contain multiple responses)

• unsigned short challengeFormat
  tabular format of the challenge points file

• bool challengeActiveOnly
  whether to import active only

• RealMatrix challengePoints
  container for the challenge points data (variables only)

• RealMatrix challengeResponses
  container for the challenge points data (responses only)

• Variables actualModelVars
  copy of the actualModel variables object used to simplify conversion among differing variable views

• bool actualModelCache
  indicates usage of an evaluation cache by the actualModel

• String actualModelInterfaceId
  the interface id from the actualModel used for ordered PRPCache lookups

• IntResponseMap beforeSynchResponseMap
  bookkeeping map to catalogue responses generated in map() for use in synchronize() and synchronize_nowait().
  This supports pseudo-asynchronous operations (approximate responses are always computed synchronously, but asynchronous virtual functions are supported through bookkeeping).
Static Private Attributes

- static size_t approxIdNum = 0
  
  *counter for giving unique names to approximation interfaces*

Additional Inherited Members

13.8.1 Detailed Description

Derived class within the interface class hierarchy for supporting approximations to simulation-based results.  

ApproximationInterface provides an interface class for building a set of global/local/multipoint approximations and performing approximate function evaluations using them. It contains a list of Approximation objects, one for each response function.

13.8.2 Member Function Documentation

void update_approximation ( const Variables & vars, const IntResponsePair & response_pr )
  [protected], [virtual]

This function populates/replaces each Approximation::anchorPoint with the incoming variables/response data point.

- Reimplemented from Interface.

  References ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, Dakota::data_pairs, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), ApproximationInterface::restore_data_key(), and ApproximationInterface::shallow_add().

void update_approximation ( const RealMatrix & samples, const IntResponseMap & resp_map )
  [protected], [virtual]

This function populates/replaces each Approximation::currentPoints with the incoming variables/response arrays.

- Reimplemented from Interface.

  References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, ApproximationInterface::actualModelVars, ApproximationInterface::approxFnIndices, ApproximationInterface::clear_active_data(), Dakota::data_pairs, ApproximationInterface::functionSurfaces, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), ApproximationInterface::restore_data_key(), and ApproximationInterface::shallow_add().

void update_approximation ( const VariablesArray & vars_array, const IntResponseMap & resp_map )
  [protected], [virtual]

This function populates/replaces each Approximation::currentPoints with the incoming variables/response arrays.

- Reimplemented from Interface.

  References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, ApproximationInterface::approxFnIndices, ApproximationInterface::clear_active_data(), Dakota::data_pairs, ApproximationInterface::functionSurfaces, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), ApproximationInterface::restore_data_key(), and ApproximationInterface::shallow_add().
void append_approximation ( const Variables & vars, const IntResponsePair & response_pr )
[protected], [virtual]
This function appends to each Approximation::currentPoints with one incoming variables/response data point.
Reimplemented from Interface.
References ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, Dakota::data_pairs, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), ApproximationInterface::restore_data_key(), ApproximationInterface::shallow_add(), and ApproximationInterface::update_pop_counts().

void append_approximation ( const RealMatrix & samples, const IntResponseMap & resp_map )
[protected], [virtual]
This function appends to each Approximation::currentPoints with multiple incoming variables/response data points.
Reimplemented from Interface.
References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, Dakota::data_pairs, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), ApproximationInterface::restore_data_key(), ApproximationInterface::sample_to_variables(), ApproximationInterface::shallow_add(), and ApproximationInterface::update_pop_counts().

void append_approximation ( const VariablesArray & vars_array, const IntResponseMap & resp_map )
[protected], [virtual]
This function appends to each Approximation::currentPoints with multiple incoming variables/response data points.
Reimplemented from Interface.
References Dakota::abort_handler(), ApproximationInterface::actualModelCache, ApproximationInterface::actualModelInterfaceId, Dakota::data_pairs, Dakota::lookup_by_ids(), ApproximationInterface::mixed_add(), ApproximationInterface::restore_data_key(), ApproximationInterface::shallow_add(), and ApproximationInterface::update_pop_counts().

void build_approximation ( const RealVector & c_lbnds, const RealVector & c_ubnds, const IntVector & d_lbnds, const IntVector & d_ubnds, const RealVector & dl_lbnds, const RealVector & dl_ubnds, const RealVector & dr_lbnds, const RealVector & dr_ubnds )
[protected], [virtual]
This function finds the coefficients for each Approximation based on the data passed through update_approximation() calls. The bounds are used only for graphics visualization.
Reimplemented from Interface.
References ApproximationInterface::approxFnIndices, SharedApproxData::build(), ApproximationInterface::challengeFile, ApproximationInterface::challengePoints, ApproximationInterface::challengeResponses, ApproximationInterface::functionSurfaces, ApproximationInterface::read_challenge_points(), SharedApproxData::set_bounds(), and ApproximationInterface::sharedData.

void export_approximation ( )
[protected], [virtual]
This function calls export on each approximation
Reimplemented from Interface.
References ApproximationInterface::approxFnIndices, and ApproximationInterface::functionSurfaces.
void rebuild_approximation ( const BoolDeque & rebuild_deque ) [protected], [virtual]
This function updates the coefficients for each Approximation based on data increments provided by {update,append}_approximation().
   Reimplemented from Interface.
   References ApproximationInterface::approxFnIndices, ApproximationInterface::functionSurfaces, SharedApproxData::rebuild(), and ApproximationInterface::sharedData.

void pop_approximation ( bool save_data ) [inline], [protected], [virtual]
This function removes data provided by a previous append_approximation() call, possibly different numbers for each function, or as specified in pop_count, which is assumed to be the same for all functions.
   Reimplemented from Interface.
   References ApproximationInterface::approxFnIndices, ApproximationInterface::functionSurfaces, SharedApproxData::pop(), Approximation::pop_coefficients(), Approximation::pop_data(), and ApproximationInterface::sharedData.

void push_approximation ( ) [inline], [protected], [virtual]
This function updates the coefficients for each Approximation based on data increments provided by {update,append}_approximation().
   Reimplemented from Interface.
   References ApproximationInterface::approxFnIndices, ApproximationInterface::functionSurfaces, SharedApproxData::post_push(), SharedApproxData::pre_push(), Approximation::push_coefficients(), Approximation::push_data(), and ApproximationInterface::sharedData.

void restore_data_key ( ) [inline], [private]
following add() and pop_count() operations which may enumerate multiple keys, restore the active approxData to the nominal key
   Restore active key to leading key for first approxData (only updates model key if needed).
   References ApproximationInterface::active_model_key(), ApproximationInterface::sharedData, and SharedApproxData::truth_model_key().
   Referenced by ApproximationInterface::append_approximation(), and ApproximationInterface::update_approximation().

void read_challenge_points ( bool active_only ) [private]
Load approximation test points from user challenge points file.
   Challenge data defaults to active/inactive, but user can override to active only.
   References ApproximationInterface::actualModelVars, ApproximationInterface::challengeActiveOnly, ApproximationInterface::challengeFile, ApproximationInterface::challengeFormat, ApproximationInterface::challengePoints, ApproximationInterface::challengeResponses, Variables::copy(), and ApproximationInterface::functionSurfaces.
   Referenced by ApproximationInterface::build_approximation().

13.8.3 Member Data Documentation

std::vector<Approximation> functionSurfaces [private]
list of approximations, one per response function
   This formulation allows the use of mixed approximations (i.e., different approximations used for different response functions), although the input specification is not currently general enough to support it.
13.9. APPSEvalMgr Class Reference

Evaluation manager class for APPSPACK.

Inherits Executor.

Public Member Functions

- **APPSEvalMgr (Optimizer & model &model)**
  constructor
- **~APPSEvalMgr ()**
  destructor
- **bool isReadyForWork () const**
  tells APPS whether or not there is a processor available to perform a function evaluation
- **bool submit (const int apps_tag, const HOPSPACK::Vector &apps_xtrial, const HOPSPACK::EvalRequestType apps_request)**
  performs a function evaluation at APPS-provided x_in
- **int recv (int &apps_tag, HOPSPACK::Vector &apps_f, HOPSPACK::Vector &apps_cEqs, HOPSPACK::Vector &apps_cIneqs, string &apps_msg)**
  returns a function value to APPS
- **std::string getEvaluatorType (void) const**
  return the type of the Dakota linked evaluator
- **void printDebugInfo (void) const**
  empty implementation of debug info needed to complete the interface
- **void printTimingInfo (void) const**
  empty implementation of timing info needed to complete the interface
- **void set_asynch_flag (const bool dakotaAsynchFlag)**
  publishes whether or not to do asynchronous evaluations
- **void set_blocking_synchron (const bool blockingSynchFlag)**
  publishes whether or not APPS is operating synchronously
- **void set_total_workers (const int numDakotaWorkers)**
  publishes the number of processors available for function evaluations
CHAPTER 13. CLASS DOCUMENTATION

Private Attributes

- **Optimizer & dakOpt**
  reference to the DakotaOptimizer
- **Model & iteratedModel**
  reference to the APPSOptimizer’s model passed in the constructor
- **bool modelAsynchFlag**
  flag for asynchronous function evaluations
- **bool blockingSynch**
  flag for APPS synchronous behavior
- **int numWorkersUsed**
  number of processors actively performing function evaluations
- **int numWorkersTotal**
  total number of processors available for performing function evaluations
- **RealVector xTrial**
  trial iterate
- **std::map<int, int> tagList**
  map of DAKOTA eval id to APPS eval id (for asynchronous evaluations)
- **std::map<int, RealVector> functionList**
  map of APPS eval id to responses (for synchronous evaluations)
- **IntResponseMap dakotaResponseMap**
  map of DAKOTA responses returned by synchronize_nowait()

13.9.1 Detailed Description

Evaluation manager class for APPSPACK.

The APPSEvalMgr class is derived from APPSPACK’s Executor class. It implements the methods of that class in such away that allows DAKOTA to manage the computation of responses instead of APPS. Iterate and response values are passed between Dakota and APPSPACK via this interface.

13.9.2 Constructor & Destructor Documentation

**APPSEvalMgr ( Optimizer & opt, Model & model )**

constructor

Evaluation manager class for APPSPACK.

The APPSEvalMgr class is derived from APPSPACK’s Executor class. It implements the methods of that class in such away that allows DAKOTA to manage the computation of responses instead of APPS. Iterate and response values are passed between Dakota and APPSPACK via this interface.

13.9.3 Member Function Documentation

**bool isReadyForWork ( ) const**

tells APPS whether or not there is a processor available to perform a function evaluation

Check to see if all processors available for function evaluations are being used. If not, tell APPS that one is available.

References APPSEvalMgr::numWorkersTotal, and APPSEvalMgr::numWorkersUsed.
bool submit ( const int apps_tag, const HOPSPACK::Vector & apps_xtrial, const HOPSPACK::EvalRequestType apps_request )

performs a function evaluation at APPS-provided x_in

Convert APPSPACK vector of variables to DAKOTA vector of variables and perform function evaluation asynchronously or not as specified in the DAKOTA input deck. If evaluation is asynchronous, map the dakota id to the APPS tag. If evaluation is synchronous, map the responses to the APPS tag.

References Model::current_response(), Model::current_variables(), Model::evaluate(), Model::evaluate_nowait(), Model::evaluation_id(), Response::function_values(), APPSEvalMgr::functionList, APPSEvalMgr::iteratedModel, APPSEvalMgr::modelAsynchFlag, APPSEvalMgr::numWorkersTotal, APPSEvalMgr::numWorkersUsed, and APPSEvalMgr::tagList.

int recv ( int & apps_tag, HOPSPACK::Vector & apps_f, HOPSPACK::Vector & apps_cEqs, HOPSPACK::Vector & apps_cIneqs, string & apps_msg )

returns a function value to APPS

Retrieve a set of response values, convert to APPS data structures, and return them to APPS. APPS tags are tied to corresponding responses using the appropriate (i.e., asynchronous or synchronous) map.

References APPSEvalMgr::blockingSynch, APPSEvalMgr::dakOpt, APPSEvalMgr::dakotaResponseMap, APPSEvalMgr::functionList, Optimizer::get_responses_from_dakota(), APPSEvalMgr::iteratedModel, APPSEvalMgr::modelAsynchFlag, APPSEvalMgr::numWorkersUsed, Model::synchronize(), Model::synchronize_nowait(), and APPSEvalMgr::tagList.

The documentation for this class was generated from the following files:

- APPSEvalMgr.hpp
- APPSEvalMgr.cpp

13.10 AppsTraits Class Reference

class APPSOptimizer

- virtual bool is Derived ()
  A temporary query used in the refactor.
- bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.
- bool supports_discrete_variables ()
  Return the flag indicating whether method supports discrete variables.
- bool supports_linear_equality ()
  Return the flag indicating whether method supports linear equalities.
- bool supports_linear_inequality ()
  Return the flag indicating whether method supports linear inequalities.
- bool supports_nonlinear_equality ()
  Return the flag indicating whether method supports nonlinear equalities.
- bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear inequalities.
- NONLINEAR_EQUALITY_FORMAT nonlinear_equality_format ()
  Return the format used for nonlinear equality constraints.
- bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear inequalities.
- NONLINEAR INEQUALITY_FORMAT nonlinear_inequality_format ()
  Return the format used for nonlinear inequality constraints.

Static Public Member Functions

- static double noValue ()
- static double getBestObj (const OptT &)
- static void copy_matrix_data (const RealMatrix &source, HOPSPACK::Matrix &target)

13.10.1 Detailed Description

Wrapper class for HOPSPACK.

The APPSOptimizer class provides a wrapper for HOPSPACK, a Sandia-developed C++ library for generalized pattern search. HOPSPACK defaults to a coordinate pattern search but also allows for augmented search patterns. It can solve problems with bounds, linear constraints, and general nonlinear constraints. APPSOptimizer uses an APPSEvalMgr object to manage the function evaluations.

The user input mappings are as follows: output max_function_evaluations, constraint tol initial_delta, contraction_factor, variable_tolerance, solution_target, synchronization, merit_function, constraint_penalty, and smoothing_factor are mapped into HOPS's "Display", "Maximum Evaluations", "Active Tolerance", "Nonlinear Active Tolerance", "Initial Step", "Contraction Factor", "Step Tolerance", "Objective Target", "Synchronous Evaluations", "Penalty Function", "Penalty Parameter", and "Penalty Smoothing Value" data attributes. Refer to the HOPS web site (https://software.sandia.gov/trac/hopspack) for additional information on HOPS objects and controls. HOPSPACK-specific traits class. AppsTraits specializes some traits accessors by over-riding the default accessors in TraitsBase.

The documentation for this class was generated from the following files:

- APPSOptimizer.hpp
- APPSOptimizer.cpp
13.11 ApreproWriter Class Reference

Utility used in derived write_core to write in aprepro format.

Public Member Functions

- template<typename ArrayType>
  void operator()(std::ostream &s, size_t start_index, size_t num_items, const ArrayType &array_data, StringMultiArrayConstView label_array)

13.11.1 Detailed Description

Utility used in derived write_core to write in aprepro format.

The documentation for this class was generated from the following file:

- DakotaVariables.hpp

13.12 AttachScaleVisitor Class Reference

Objects of this class are called by boost::apply_visitor to add dimension scales (RealScale or StringScale) to HDF5 datasets.

Inherits static_visitor<>.

Public Member Functions

- AttachScaleVisitor (const StrStrSizet &iterator_id, const StringArray &location, const int &dim, const String &dsetName, const std::shared_ptr<HDF5IOHelper> &hdf5_stream)
  Construct with context for attaching the scale, including the iterator and location used to construct the scale, the dimension and name of the dataset to attach the scale to, the HDF5IOHelper instance.

- void operator() (const RealScale &scale)
  Called by boost::apply_visitor to process a RealScale.

- void operator() (const StringScale &scale)
  Called by boost::apply_visitor to process a StringScale.

Private Attributes

- StrStrSizet iteratorID
  Iterator ID for the method and execution.

- StringArray location
  Location used to create the dataset.

- int dimension
  Dimension of the dataset to attach the scale to.

- String dsetName
  Name of the dataset to attach the scale to.

- std::shared_ptr<HDF5IOHelper> hdf5Stream
  Instance of HDF5IOHelper.
13.12.1 Detailed Description

Objects of this class are called by boost::appy_visitor to add dimension scales (RealScale or StringScale) to HDF5 datasets.

The documentation for this class was generated from the following file:

- ResultsDBHDF5.hpp

13.13 BaseConstructor Struct Reference

Dummy struct for overloading letter-envelope constructors.

Public Member Functions

- BaseConstructor (int=0)

  C++ structs can have constructors.

13.13.1 Detailed Description

Dummy struct for overloading letter-envelope constructors.

BaseConstructor is used to overload the constructor for the base class portion of letter objects. It avoids infinite recursion (Coplien p.139) in the letter-envelope idiom by preventing the letter from instantiating another envelope. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- dakota_global_defs.hpp

13.14 BootstrapSampler< Data > Class Template Reference

Actual bootstrap sampler implementation for common data types.

Inheritance diagram for BootstrapSampler< Data >:

```
BootstrapSamplerBase< Data >

BootstrapSampler< Data >

BootstrapSamplerWithGS< Data, Getter, Setter >
```

Public Member Functions

- BootstrapSampler (const Data &orig_data, size_t block_size=1)

  Constructor for the sampler.

- virtual ~BootstrapSampler ()

  Destructor.

- virtual void operator() (size_t num_samp, Data &bootstrapped_sample)
13.15. **BOOTSTRAP_SAMPLER**< **TEUCHOS::SERIAL_DENSE_MATRIX**< **ORDINAL_TYPE, SCALAR_TYPE** >>> **CLASS TEMPLATE REFERENCE**

**Protected Attributes**

- `size_t blockSize`

  *Size of the block defining a sample.*

**Additional Inherited Members**

13.14. **Detailed Description**

```cpp
template<typename Data>
class Dakota::BootstrapSampler<Data>
```

Actual bootstrap sampler implementation for common data types. Template requires the given type to support an STL-like interface, including a size method and begin and end methods returning random access iterators.

13.14.2 **Member Function Documentation**

```cpp
virtual void operator() ( size_t num_samp, Data & bootstrapped_sample ) [inline], [virtual]
```

Implements `BootstrapSamplerBase<Data>`. Reimplemented in `BootstrapSamplerWithGS<Data, Getter, Setter>`. References `BootstrapSampler<Data>::blockSize`, `BootstrapSamplerBase<Data>::bootstrapRNG`, `BootstrapSamplerBase<Data>::origData`, and `BootstrapSamplerBase<Data>::sampler`. The documentation for this class was generated from the following file:

- `BootstrapSampler.hpp`

13.15 **BootstrapSampler< TEUCHOS::SerialDenseMatrix< OrdinalType, ScalarType > > Class Template Reference**

Bootstrap sampler that is specialized to allow for the bootstrapping of `RealMatrix`.

13.15.1 Detailed Description

template<typename OrdinalType, typename ScalarType>
class Dakota::BootstrapSampler< Teuchos::-
SerialDenseMatrix< OrdinalType, ScalarType > >

Bootstrap sampler that is specialized to allow for the bootstrapping of RealMatrix.

13.15.2 Member Function Documentation

virtual void operator() ( size_t num_samp, MatType & bootstrapped_sample ) [inline], [virtual]

Implements BootstrapSamplerBase< Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > >.

References BootstrapSampler< Data >::blockSize, BootstrapSamplerBase< Data >::bootstrapRNG, Bootstrap-
SamplerBase< Data >::origData, and BootstrapSamplerBase< Data >::sampler.

The documentation for this class was generated from the following file:

- BootstrapSampler.hpp

13.16 BootstrapSamplerBase< Data > Class Template Reference

Base class/interface for the bootstrap sampler.

Inheritance diagram for BootstrapSamplerBase< Data >:

```
    BootstrapSamplerBase< Data >
     |                         
     BootstrapSampler< Data >
     |                         
    BootstrapSamplerWithGS< Data, Getter, Setter >
```
Public Member Functions

- **BootstrapSamplerBase** (size_t data_size, Data orig_data)
  
  Constructor for the bootstrap functor base.
- virtual ~BootstrapSamplerBase ()
  
  Destructor.
- virtual void operator() (size_t num_samp, Data &bootstrapped_sample)=0
  
  Generate and store a new boostrapped sample into bootstrapped_sample.
- virtual size_t getDataSize ()
  
  Obtain the number of samples used in the empirical distribution.
- virtual void operator() (Data &bootstrapped_sample)
  
  Generate and store a dataSize out of dataSize bootstrap sample.
- virtual Data operator() ()
  
  Return boostrapped sample.

Static Public Member Functions

- static void set_seed (size_t seed)

Protected Attributes

- boost::random::uniform_int_distribution sampler
  
  Uniform distribution to provide samples from the empirical distribution.
- const size_t dataSize
  
  Size of the dataset defining the empirical distribution.
- Data origData
  
  Original data defining the empirical distribution TODO: Consider if it should be const (breaks Teuchos)

Static Protected Attributes

- static boost::random::mt19937 bootstrapRNG
  
  Random number generator to use for sampling.

13.16.1  Detailed Description

```
template<typename Data> class Dakota::BootstrapSamplerBase<Data>
```

Base class/interface for the bootstrap sampler.

**BootstrapSamplerBase** defines the minimum interface for a bootstrap sampler and handles initialization of the random variate generation used by the bootstrap. Functor is templated on the data type, but does not actually define a data member.
13.16.2 Member Data Documentation

boost::random::mt19937 bootstrapRNG  [static], [protected]

Random number generator to use for sampling.

The bootstrap random number generator.

Referenced by BootstrapSampler< Data >::operator(), BootstrapSampler< Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > >::operator(), and BootstrapSamplerWithGS< Data, Getter, Setter >::operator().

The documentation for this class was generated from the following file:

- BootstrapSampler.hpp

13.17 BootstrapSamplerWithGS< Data, Getter, Setter > Class Template Reference

A derived sampler to allow for user specification of the accessor methods.

Inheritance diagram for BootstrapSamplerWithGS< Data, Getter, Setter >:

```
  BootstrapSamplerWithGS< Data, Getter, Setter >
  BootstrapSampler< Data >
  BootstrapSamplerBase< Data >
```

Public Member Functions

- **BootstrapSamplerWithGS** (const Data &orig_data, Getter getter_method, Setter setter_method)
  
  Constructor with extra arguments for the accessor methods.

- **virtual ~BootstrapSamplerWithGS** ()
  
  Destructor.

- **virtual void operator()** (size_t num_samp, Data &bootstrapped_sample)
  
  Generate and store a new boostrapped sample into bootstrapped_sample TODO: bounds checking.

Protected Attributes

- **Getter getterMethod**
  
  Function to obtain a single sample from a Data object. Function should take a Data object and an unsigned integer corresponding to a sample index and return the sample.

- **Setter setterMethod**
  
  Function to place a single sample into a Data object. Function should take a Data object and an unsigned integer corresponding to the sample index to set.
Additional Inherited Members

13.17.1 Detailed Description

template<typename Data, typename Getter, typename Setter>
class Dakota::BootstrapSamplerWithGS<Data, Getter, Setter>
A derived sampler to allow for user specification of the accessor methods.

The documentation for this class was generated from the following file:

- BootstrapSampler.hpp

13.18 callback_data Struct Reference

Public Attributes

- double rosen_cdv_upper_bd
  
  upper bound value to pass through parser to callback function

13.18.1 Detailed Description

Data structure to pass application-specific values through Dakota back to the callback function, for example to convey late updates to bounds, initial points, etc., to Dakota.

The documentation for this struct was generated from the following file:

- library_mode.cpp

13.19 COLINAApplication Class Reference

Inherits Application<colin::MO_MINLP2_problem>.

Public Member Functions

- COLINAApplication()
  
  Default constructor. Required by COLIN’s ApplicationHandle creation.

- COLINAApplication(Model &model)
  
  Constructor with Model (not presently used).

- ~COLINAApplication()
  
  Destructor.

- void set_problem(Model &model)
  
  Helper function called after default construction to extract problem information from the Model and set it for COLIN.

- void set_blocking_synch(const bool blockingSynchFlag)
  
  publishes whether or not COLIN is operating synchronously

- virtual utilib::Any spawn_evaluation_impl(const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed)
  
  Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID.

- virtual bool evaluation_available()
Check to see if there are any function values ready to be collected.

- virtual void perform_evaluation_impl (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed, colin::AppResponse::response_map_t &colin_responses)
  
  Perform a function evaluation at t given point.

- virtual utilib::Any collect_evaluation_impl (colin::AppResponse::response_map_t &responses, utilib::seed_t &seed)
  
  Collect a completed evaluation from DAKOTA.

- virtual void colin_request_to_dakota_request (const utilib::Any &domain, const colin::AppRequest::request_map_t &requests, utilib::seed_t &seed)
  
  Helper function to convert evaluation request data from COLIN structures to DAKOTA structures.

- virtual void dakota_response_to_colin_response (const Response &dakota_response, colin::AppResponse::response_map_t &colin_responses)
  
  Helper function to convert evaluation response data from DAKOTA structures to COLIN structures.

- virtual bool map_domain (const utilib::Any &src, utilib::Any &native, bool forward=true) const
  
  Map the domain point into data type desired by this application context.

Protected Attributes

- Model iteratedModel
  
  Shallow copy of the model on which COLIN will iterate.

- bool blockingSynch
  
  Flag for COLIN synchronous behavior (Pattern Search only).

- ActiveSet activeSet
  
  Local copy of model’s active set for convenience.

- std::vector<int> requestedEvals
  
  Evaluations queued for async evaluation.

- IntResponseMap dakota_responses
  
  eval_id to response mapping to cache completed jobs.

13.19.1 Detailed Description

COLINApplication is a DAKOTA class that is derived from COLIN’s Application hierarchy. It redefines a variety of virtual COLIN functions to use the corresponding DAKOTA functions. This is a more flexible algorithm library interfacing approach than can be obtained with the function pointer approaches used by NPSOLOptimizer and SNLLOptimizer.

13.19.2 Member Function Documentation

void set_problem ( Model & model )

Helper function called after default construction to extract problem information from the Model and set it for COLIN.

Set variable bounds and linear and nonlinear constraints. This avoids using probDescDB, so it is called by both the standard and the on-the-fly COLINOptimizer constructors.

References Response::active_set(), COLINApplication::activeSet, Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Dakota::copy_data_partial(), Model::current_response(), Model::cv(), Model::discrete_int_lower_bounds(), Model::discrete_int_sets(), Model::discrete_int_upper_bounds(), Model::discrete_set_int_values(),...
Model::discrete_set_real_values(), Model::discrete_set_string_values(), Model::div(), Model::drv(), Model::dsv(),
Dakota::get_nonlinear_constraints(), COLINApplication::iteratedModel, Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_targets(), Model::linear_ineq_constraint_coeffs(), Model::linear_ineq_constraint_lower_bounds(), Model::linear_ineq_constraint_upper_bounds(), Model::num_linear_eq_constraints(), Model::num_linear_ineq_constraints(), Model::num_primary_fns(), Model::num_secondary_fns(), and Model::primary_response_fn_sense().

Referenced by COLINApplication::COLINApplication().

utilib::Any spawn_evaluation_impl ( const utilib::Any & domain, const colin::AppRequest::request_map_t & requests, utilib::seed_t & seed ) [virtual]
Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID.
Schedule one or more requests at specified domain point, returning a DAKOTA-specific evaluation tracking ID. This is only called by COLIN’s concurrent evaluator, which is only instantiated when the Model supports asynch evals. The domain point is guaranteed to be compatible with data type specified by map_domain(...)
References COLINApplication::colin_request_to_dakota_request(), Model::evaluate_nowait(), Model::evaluation_id(), and COLINApplication::iteratedModel.

bool evaluation_available ( ) [virtual]
Check to see if any function values ready to be collected.
Check to see if any asynchronous evaluations have finished. This is only called by COLIN’s concurrent evaluator, which is only instantiated when the Model supports asynch evals.
References COLINApplication::blockingSynch, COLINApplication::dakota_responses, COLINApplication::iteratedModel, Model::synchronize(), and Model::synchronize_nowait().

void perform_evaluation_impl ( const utilib::Any & domain, const colin::AppRequest::request_map_t & requests, utilib::seed_t & seed, colin::AppResponse::response_map_t & colin_responses ) [virtual]
Perform a function evaluation at t given point.
Perform an evaluation at a specified domain point. Wait for and return the response. This is only called by COLIN’s serial evaluator, which is only instantiated when the Model does not support asynch evals. The domain point is guaranteed to be compatible with data type specified by map_domain(...)
References COLINApplication::colin_request_to_dakota_request(), Model::current_response(), COLINApplication::dakota_response_to_colin_response(), Model::evaluate(), and COLINApplication::iteratedModel.

utilib::Any collect_evaluation_impl ( colin::AppResponse::response_map_t & colin_responses, utilib::seed_t & seed ) [virtual]
Collect a completed evaluation from DAKOTA.
Collect the next completed evaluation from DAKOTA. Always returns the evalid of the response returned.
References COLINApplication::dakota_response_to_colin_response(), and COLINApplication::dakota_responses.

void colin_request_to_dakota_request ( const utilib::Any & domain, const colin::AppRequest::request_map_t & requests, utilib::seed_t & seed ) [virtual]
Helper function to convert evaluation request data from COLIN structures to DAKOTA structures.
Helper function to convert evaluation request data from COLIN structures to DAKOTA structures.
References Model::continuous_variables(), Model::discrete_int_sets(), Model::discrete_int_variable(), Model::discrete_real_variable(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Model::discrete_set_string_values(), Model::discrete_string_variable(), Model::div(), Model::drv(), Model::dsv(), COLINApplication::iteratedModel, Model::response_size(), and Dakota::set_index_to_value().
Referenced by COLINApplication::perform_evaluation_impl(), and COLINApplication::spawn_evaluation_impl().

```cpp
void dakota_response_to_colin_response ( const Response & dakota_response,
    colin::AppResponse::response_map_t & colin_responses ) [virtual]
```

Gelper function to convert evaluation response data from DAKOTA structures to COLIN structures.
- Map DAKOTA objective and constraint values to COLIN response.
- References Response::active_set_request_vector(), and Response::function_value().
- Referenced by COLINApplication::collect_evaluation_impl(), and COLINApplication::perform_evaluation_impl().

```cpp
bool map_domain ( const utilib::Any & src, utilib::Any & native, bool forward = true ) const [virtual]
```

Map the domain point into data type desired by this application context.
- Map the domain point into data type desired by this application context (utilib::MixedIntVars). This data type can be exposed from the Any &domain presented to spawn and collect.

The documentation for this class was generated from the following files:
- COLINApplication.hpp
- COLINApplication.cpp

### 13.20 COLINTraits Class Reference

Wrapper class for optimizers defined using COLIN.

Inheritance diagram for COLINTraits:

```
TraitsBase
\|-- COLINTraits
```

**Public Member Functions**

- **COLINTraits ()**
  - *default constructor*
- **virtual ~COLINTraits ()**
  - *destructor*
- **virtual bool is_derived ()**
  - *A temporary query used in the refactor.*
- **bool supports_continuous_variables ()**
  - *Return the flag indicating whether method supports continuous variables.*
- **bool supports_nonlinear_equality ()**
  - *Return the flag indicating whether method supports nonlinear equalities.*
- **bool supports_nonlinear_inequality ()**
Return the flag indicating whether method supports nonlinear inequalities.

- **NONLINEAR_INEQUALITY_FORMAT**

  `nonlinear_inequality_format()`

  Return the format used for nonlinear inequality constraints.

### 13.20.1 Detailed Description

Wrapper class for optimizers defined using COLIN.

The COLINOptimizer class wraps COLIN, a Sandia-developed C++ optimization interface library. A variety of COLIN optimizers are defined in COLIN and its associated libraries, including SCOLIB which contains the optimization components from the old COLINY (formerly SGOPT) library. COLIN contains optimizers such as genetic algorithms, pattern search methods, and other nongradient-based techniques. COLINOptimizer uses a COLINApplication object to perform the function evaluations.

The user input mappings are as follows: `max_iterations`, `max_function_evaluations`, `convergence_tolerance`, and `solution_accuracy` are mapped into COLIN’s `max_iterations`, `max_function_evaluations`, `this_trial`, `function_value_tolerance`, `sufficient_objective_value` properties. An `outputLevel` is mapped to COLIN’s `output_level` property and a setting of `debug` activates output of method initialization and sets the COLIN `debug` attribute to 10000 for the `DEBUG` output level. Refer to [Hart, W.E., 2006] for additional information on COLIN objects and controls. A version of TraitsBase specialized for COLIN optimizers.

The documentation for this class was generated from the following file:

- COLINOptimizer.hpp

### 13.21 CollabHybridMetaIterator Class Reference

Meta-iterator for hybrid iteration using multiple collaborating optimization and nonlinear least squares methods.

Inheritance diagram for CollabHybridMetaIterator:

```
        Iterator
         |
         v
MetaIterator
          |
          v
CollabHybridMetaIterator
```

#### Public Member Functions

- **CollabHybridMetaIterator (ProblemDescDB &problem_db)**

  *standard constructor*

- **CollabHybridMetaIterator (ProblemDescDB &problem_db, Model &model)**

  *alternate constructor*

- **~CollabHybridMetaIterator ()**

  *destructor*
CHAPTER 13. CLASS DOCUMENTATION

Protected Member Functions

- `void core_run()`  
  Performs the collaborative hybrid iteration.
- `void derived_init_communicators (ParLevIter pl_iter)`  
  Derived class contributions to initializing the communicators associated with this Iterator instance
- `void derived_set_communicators (ParLevIter pl_iter)`  
  Derived class contributions to setting the communicators associated with this Iterator instance
- `void derived_free_communicators (ParLevIter pl_iter)`  
  Derived class contributions to freeing the communicators associated with this Iterator instance
- `IntIntPair estimate_partition_bounds()`  
  Estimate the minimum and maximum partition sizes that can be utilized by this Iterator
- `const Variables & variables_results()`  
  Return the final solution from the collaborative iteration (variables)
- `const Response & response_results()`  
  Return the final solution from the collaborative iteration (response)

Private Attributes

- `String hybridCollabType`  
  ABO or HOPS
- `StringArray methodStrings`  
  The list of method pointer or method name identifiers
- `StringArray modelStrings`  
  The list of model pointer identifiers for method identification by name
- `bool lightwtMethodCtor`  
  Use of lightweight Iterator construction by name
- `bool singlePassedModel`  
  Use of constructor that enforces use of a single passed Model
- `IteratorArray selectedIterators`  
  The set of iterators, one for each entry in methodStrings
- `ModelArray selectedModels`  
  The set of models, one for each iterator
- `Variables bestVariables`  
  Best variables found in collaborative iteration
- `Response bestResponse`  
  Best response found in collaborative iteration

Additional Inherited Members

13.21.1 Detailed Description

Meta-iterator for hybrid iteration using multiple collaborating optimization and nonlinear least squares methods.  
This meta-iterator has two approaches to hybrid iteration: (1) agent-based using the ABO framework; (2)  
nonagent-based using the HOPSPACK framework.  
The documentation for this class was generated from the following files:
13.22 CommandLineHandler Class Reference

Utility class for managing command line inputs to DAKOTA.

Inheritance diagram for CommandLineHandler:

```
CommandLineHandler
     |___________
        |          
        | GetLongOpt
        |___________
```

### Public Member Functions

- **`CommandLineHandler()`**
  - default constructor, requires `check_usage()` call for parsing
- **`CommandLineHandler(int argc, char **argv, int world_rank)`**
  - constructor with parsing
- **`~CommandLineHandler()`**
  - destructor
- **`void check_usage(int argc, char **argv)`**
  - Verifies that DAKOTA is called with the correct command usage. Prints a descriptive message and exits the program if incorrect.
- **`int read_restart_evals() const`**
  - Returns the number of evaluations to be read from the restart file (as specified on the DAKOTA command line) as an integer instead of a const char*.
- **`void usage(std::ostream &outfile=Cout) const`**
  - Print usage information to outfile, conditionally on rank.

### Private Member Functions

- **`void initialize_options()`**
  - enrolls the supported command line inputs.
- **`void output_helper(const std::string &message, std::ostream &os)`**
  - output only on Dakota worldRank 0 if possible

### Private Attributes

- **`int worldRank`**
  - Rank of this process within Dakota’s allocation; manages conditional output.
Additional Inherited Members

13.22.1 Detailed Description

Utility class for managing command line inputs to DAKOTA.

`CommandLineHandler` provides additional functionality that is specific to DAKOTA’s needs for the definition and parsing of command line options. Inheritance is used to allow the class to have all the functionality of the base class, `GetLongOpt`.

13.22.2 Member Function Documentation

```cpp
void output_helper ( const std::string & message, std::ostream & os ) const [private]
```

output only on Dakota worldRank 0 if possible

- When there is a valid `ParallelLibrary`, output only on rank 0
- References `CommandLineHandler::worldRank`.
- Referenced by `CommandLineHandler::check_usage()`.

The documentation for this class was generated from the following files:

- `CommandLineHandler.hpp`
- `CommandLineHandler.cpp`

13.23 CommandShell Class Reference

Utility class which defines convenience operators for spawning processes with system calls.

Public Member Functions

- `CommandShell ()`
  constructor
- `~CommandShell ()`
  destructor
- `CommandShell & operator<< (const char *cmd)`
  appends cmd to sysCommand
- `CommandShell & operator<< (const std::string &cmd)`
  convenient operator: appends string to the commandString to be executed
- `CommandShell & operator<< (CommandShell & (f)(CommandShell &))`
  allows passing of the flush function to the shell using `<<`
- `CommandShell & flush ()`
  “flushes” the shell; i.e. executes the sysCommand
- `void asynch_flag (const bool flag)`
  set the asynchFlag
- `bool asynch_flag () const`
  get the asynchFlag
- `void suppress_output_flag (const bool flag)`
  set the suppressOutputFlag
- `bool suppress_output_flag () const`
  get the suppressOutputFlag
13.24. **CONCURRENTMETAITERATOR CLASS REFERENCE**

**Private Attributes**

- std::string sysCommand
  
  *The command string that is constructed through one or more `<<` insertions and then executed by flush.*

- bool asynchFlag
  
  *flags nonblocking operation (background system calls)*

- bool suppressOutputFlag
  
  *flags suppression of shell output (no command echo)*

13.23.1 **Detailed Description**

Utility class which defines convenience operators for spawning processes with system calls.

The **CommandShell** class wraps the C `system()` utility and defines convenience operators for building a command string and then passing it to the shell.

13.23.2 **Member Function Documentation**

**CommandShell & operator<< (const char *cmd) [inline]**

appends `cmd` to `sysCommand`

  Convenient operator: appends string to the commandString to be executed

  References **CommandShell::sysCommand**.

**CommandShell & operator<< (CommandShell & (*)(CommandShell &)) [inline]**

allows passing of the flush function to the shell using `<<`

  Convenience operator: allows passing of the flush func to the shell via `<<`

**CommandShell & flush ()**

"flushes" the shell; i.e. executes the `sysCommand`

Executes the `sysCommand` by passing it to `system()`. Appends an "&" if `asynchFlag` is set (background system call) and echos the `sysCommand` to `Cout` if `suppressOutputFlag` is not set.

References **Dakota::abort_handler()**, **CommandShell::asynchFlag**, **CommandShell::suppressOutputFlag**, and **CommandShell::sysCommand**.

Referenced by **Dakota::flush()**.

13.24. CONCURRENTMETAINTERATOR CLASS REFERENCE

used by IteratorScheduler to unpack results data from an iterator run

• void update_local_results (int job_index)
  used by IteratorScheduler to update local results arrays

• const Model & algorithm_space_model () const
  return the result of any recasting or surrogate model recursion layered on top of iteratedModel by the derived
  Iterator ctor chain

Private Member Functions

• void initialize_iterator (const RealVector &param_set)
  called by unpack_parameters_initialize(MPIUnpackBuffer) and initialize_iterator(int) to update iteratedModel and
  selectedIterator

• void initialize_model ()
  initialize the iterated Model prior to Iterator instantiation and define param_setLen

Private Attributes

• Iterator selectedIterator
  the iterator selected for concurrent iteration

• RealVector initialPt
  the initial continuous variables for restoring the starting point in the Pareto set minimization

• RealVectorArray parameterSets
  an array of parameter set vectors (either multistart variable sets or pareto multi-objective/least squares weighting
  sets) to be performed.

• int paramSetLen
  length of each of the parameter sets associated with an iterator job (number of continuous variables for MULTI-
  START, number of objective fns for PARETO SET)

• int numRandomJobs
  number of randomly-generated parameter sets to evaluate

• int randomSeed
  seed for random number generator for random samples

• PRPArray prpResults
  1-d array of ParamResponsePair results corresponding to numIteratorJobs

Friends

• class IteratorScheduler
  protect scheduler callback functions from general access

Additional Inherited Members

13.24.1 Detailed Description

Meta-iterator for multi-start iteration or pareto set optimization.

This meta-iterator maintains two concurrent iterator capabilities. First, a general capability for running an
iterator multiple times from different starting points is provided (often used for multi-start optimization, but not
restricted to optimization). Second, a simple capability for mapping the "pareto frontier" (the set of optimal
solutions in multiobjective formulations) is provided. This pareto set is mapped through running an optimizer multiple times for different sets of multiobjective weightings.

13.24.2 Member Function Documentation

```cpp
void pre_run( ) [protected], [virtual]
```

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori.

- pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented from Iterator.

References Analyzer::all_samples(), Iterator::all_samples(), ParallelLibrary::bcast_hx(), Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::continuous_variables(), Dakota::copy_data(), Model::estimate_message_lengths(), ConcurrentMetaIterator::initialPt, Iterator::iteratedModel, IteratorScheduler::iterator_, message_lengths(), IteratorScheduler::iteratorCommRank, IteratorScheduler::iteratorScheduling, IteratorScheduler::iteratorServerId, MetaIterator::iterSched, IteratorScheduler::lead_rank(), Model::message_lengths(), Iterator::method_Name, Iterator::methodPCIter, IteratorScheduler::miPLIndex, IteratorScheduler::numIteratorJobs, IteratorScheduler::numIteratorServers, ConcurrentMetaIterator::numRandomJobs, Iterator::parallelLib, ConcurrentMetaIterator::parameterSets, ConcurrentMetaIterator::paramSetLen, ConcurrentMetaIterator::prpResults, ConcurrentMetaIterator::randomSeed, and MPIPackBuffer::size().

```cpp
void print_results( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
```

print the final iterator results.

- This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Iterator.

### 13.25.1 Detailed Description

Wrapper class for the CONMIN optimization library. The CONMINOptimizer class provides a wrapper for CONMIN, a Public-domain Fortran 77 optimization library written by Gary Vanderplaats under contract to NASA Ames Research Center. The CONMIN User’s Manual is contained in NASA Technical Memorandum X-62282, 1978. CONMIN uses a reverse communication mode, which avoids the static member function issues that arise with function pointer designs (see NPSOL-Optimizer and SNL LOptimizer).

The user input mappings are as follows: max iterations is mapped into CONMIN’s ITMAX parameter, max function evaluations is implemented directly in the core run() loop since there is no CONMIN parameter equivalent, convergence tolerance is mapped into CONMIN’s DELFUN and DABFUN parameters, output verbosity is mapped into CONMIN’s IPRINT parameter (verbose: IPRINT = 4; quiet: IPRINT = 2), gradient mode is mapped into CONMIN’s NFbG parameter, and finite difference step size is mapped into CONMIN’s FDCH and FDCHM parameters. Refer to [Vanderplaats, 1978] for additional information on CONMIN parameters. A version of TraitsBase specialized for CONMIN optimizers.

The documentation for this class was generated from the following file:

- CONMINOptimizer.hpp

### 13.26 ConsoleRedirector Class Reference

Public Member Functions

- **ConsoleRedirector (std::ostream & dakota_stream, std::ostream & default_dest)**
CHAPTER 13. CLASS DOCUMENTATION

Constructor taking a reference to the Dakota Cout/Cerr handle and a default destination to use when no redirection (or destruct)

- ~ConsoleRedirector()

  when the redirector stack is destroyed, it will rebind the output handle to the default ostream, then destroy open files

- void push_back()

  push back the default or repeat the last pushed file stream

- void push_back(const String &filename)

  push back a new output filestream, or repeat the last one if no filename change

- void pop_back()

  pop the last redirection

Protected Attributes

- std::ostream * & ostreamHandle

  The handle (target ostream) through which output is sent; typically dakota_cout or dakota_cerr. Will be rebound to specific streams as they are pushed or popped.

- std::ostream * defaultOStream

  initial stream to reset to when redirections are done (typically std::cout or std::cerr)

- std::vector< std::shared_ptr<OutputWriter> > ostreamDestinations

  stack of redirections to OutputWriters; shared pointers are used to potentially share the same ostream at multiple levels

Private Member Functions

- ConsoleRedirector()

  default constructor is disallowed

- ConsoleRedirector(const ConsoleRedirector &)

  copy constructor is disallowed due

- const ConsoleRedirector & operator= (const ConsoleRedirector &)

  assignment is disallowed

13.26.1 Detailed Description

Component to manage a set of output or error redirections. Push operations may present a new filename, or none in order to preserve current binding to cout/cerr or file, but place an entry on the stack. Cout/Cerr are rebound as needed when a stream is destroyed on pop.

The documentation for this class was generated from the following files:

- OutputManager.hpp
- OutputManager.cpp
13.27 Constraints Class Reference

Base class for the variable constraints class hierarchy.

Private Member Functions

- Constraints * `get_constraints` (const ProblemDescDB &problem_db, const SharedVariablesData &svd)
  Used only by the constructor to initialize constraintsRep to the appropriate derived type.
- Constraints * `get_constraints` (const SharedVariablesData &svd) const
  Used by `copy()` to initialize constraintsRep to the appropriate derived type.

Private Attributes

- Constraints * `constraintsRep`
  pointer to the letter (initialized only for the envelope)
- int `referenceCount`
  number of objects sharing constraintsRep

13.27.1 Detailed Description

Base class for the variable constraints class hierarchy.

The `Constraints` class is the base class for the class hierarchy managing bound, linear, and nonlinear constraints. Using the variable lower and upper bounds arrays from the input specification, different derived classes define different views of this data. The linear and nonlinear constraint data is consistent in all views and is managed at the base class level. For memory efficiency and enhanced polymorphism, the variable constraints hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (`Constraints`) serves as the envelope and one of the derived classes (selected in `Constraints::get_constraints()`) serves as the letter.
13.27.2 Constructor & Destructor Documentation

**Constraints ( )**

default constructor

The default constructor: constraintsRep is NULL in this case (a populated problem_db is needed to build a meaningful Constraints object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

**Constraints ( const ProblemDescDB & problem_db, const SharedVariablesData & svd )**

standard constructor

The envelope constructor only needs to extract enough data to properly execute get_constraints, since the constructor overloaded with BaseConstructor builds the actual base class data inherited by the derived classes.

References Dakota::abort_handler(), Constraints::constraintsRep, and Constraints::get_constraints().

**Constraints ( const SharedVariablesData & svd )**

alternate constructor for instantiations on the fly

Envelope constructor for instantiations on the fly. This constructor executes get_constraints(view), which invokes the default derived/base constructors, followed by a reshape() based on vars_comps.

References Dakota::abort_handler(), Constraints::constraintsRep, and Constraints::get_constraints().

**Constraints ( const Constraints & con )**

copy constructor

Copy constructor manages sharing of constraintsRep and incrementing of referenceCount.

References Constraints::constraintsRep, and Constraints::referenceCount.

**~Constraints ( ) [virtual]**

destructor

Destructor decrements referenceCount and only deletes constraintsRep when referenceCount reaches zero.

References Constraints::constraintsRep, and Constraints::referenceCount.

**Constraints ( BaseConstructor, const ProblemDescDB & problem_db, const SharedVariablesData & svd ) [protected]**

constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

This constructor is the one which must build the base class data for all derived classes. get_constraints() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid recursion in the base class constructor calling get_constraints() again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~Constraints).

References Constraints::build_views(), Constraints::manage_linear_constraints(), and Constraints::shape().

**Constraints ( BaseConstructor, const SharedVariablesData & svd ) [protected]**

constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

This constructor is the one which must build the base class data for all derived classes. get_constraints() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to
avoid recursion in the base class constructor calling \texttt{get\_constraints()} again). Since the letter IS the representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in \texttt{~Constraints}).

References \texttt{Constraints::build\_views()}, and \texttt{Constraints::shape()}.  

\textbf{13.27.3 Member Function Documentation}  

\texttt{Constraints \texttt{operator= ( const Constraints \& con )}}  

assignment operator

References \texttt{Constraints::constraintsRep}, and \texttt{Constraints::referenceCount}.  

\texttt{Constraints \texttt{copy ( ) const}}  

for use when a deep copy is needed (the representation is \textit{not} shared)

Deep copies are used for history mechanisms that catalogue permanent copies (should not change as the representation within userDefinedConstraints changes).

References \texttt{Constraints::allContinuousLowerBnds}, \texttt{Constraints::allContinuousUpperBnds}, \texttt{Constraints::allDiscreteIntLowerBnds}, \texttt{Constraints::allDiscreteIntUpperBnds}, \texttt{Constraints::allDiscreteRealLowerBnds}, \texttt{Constraints::allDiscreteRealUpperBnds}, \texttt{Constraints::build\_views()}, \texttt{Constraints::constraintsRep}, \texttt{Constraints::get\_constraints()}, \texttt{Constraints::linearEqConCoefs}, \texttt{Constraints::linearEqConTargets}, \texttt{Constraints::linearIneqConCoefs}, \texttt{Constraints::linearIneqConLowerBnds}, \texttt{Constraints::linearIneqConUpperBnds}, \texttt{Constraints::nonlinearEqConTargets}, \texttt{Constraints::nonlinearEqConLowerBnds}, \texttt{Constraints::nonlinearEqConUpperBnds}, \texttt{Constraints::numLinearEqCons}, \texttt{Constraints::numLinearIneqCons}, \texttt{Constraints::numNonlinearEqCons}, \texttt{Constraints::numNonlinearIneqCons}, and \texttt{Constraints::sharedVarsData}.

Referenced by \texttt{SurrogateModel::force\_rebuild()}, and \texttt{RecastModel::init\_constraints()}.  

\texttt{void \texttt{shape ( )}}  

shape the lower/upper bound arrays based on sharedVarsData

Resizes the derived bounds arrays.

References \texttt{SharedVariablesData::all\_counts()}, \texttt{Constraints::allContinuousLowerBnds}, \texttt{Constraints::allContinuousUpperBnds}, \texttt{Constraints::allDiscreteIntLowerBnds}, \texttt{Constraints::allDiscreteIntUpperBnds}, \texttt{Constraints::allDiscreteRealLowerBnds}, \texttt{Constraints::allDiscreteRealUpperBnds}, \texttt{Constraints::build\_views()}, \texttt{Constraints::constraintsRep}, \texttt{Constraints::shape()}, and \texttt{Constraints::sharedVarsData}.

\texttt{void \texttt{reshape ( size\_t num\_nln\_ineq\_cons, size\_t num\_nln\_eq\_cons, size\_t num\_lin\_ineq\_cons, size\_t num\_lin\_eq\_cons )}}  

reshape the linear/nonlinear constraint arrays

Resizes the linear and nonlinear constraint arrays at the base class. Does NOT currently resize the derived bounds arrays.

References \texttt{Constraints::constraintsRep}, \texttt{Constraints::continuousLowerBnds}, \texttt{Constraints::discreteIntLowerBnds}, \texttt{Constraints::discreteRealLowerBnds}, \texttt{Constraints::linearEqConCoefs}, \texttt{Constraints::linearEqConTargets}, \texttt{Constraints::linearIneqConCoefs}, \texttt{Constraints::linearIneqConLowerBnds}, \texttt{Constraints::linearIneqConUpperBnds}, \texttt{Constraints::nonlinearEqConTargets}, \texttt{Constraints::nonlinearEqConLowerBnds}, \texttt{Constraints::nonlinearEqConUpperBnds}, \texttt{Constraints::numLinearEqCons}, \texttt{Constraints::numLinearIneqCons}, \texttt{Constraints::numNonlinearEqCons}, \texttt{Constraints::numNonlinearIneqCons}, and \texttt{Constraints::reshape()}.  

\textbf{References}
void manage_linear_constraints ( const ProblemDescDB & problem_db ) [protected]

perform checks on user input, convert linear constraint coefficient input to matrices, and assign defaults

Convenience function called from derived class constructors. The number of variables active for applying linear constraints is currently defined to be the number of active continuous variables plus the number of active discrete variables (the most general case), even though very few optimizers can currently support mixed variable linear constraints.

References Dakota::abort_handler(), Constraints::continuousLowerBnds, Dakota::copy_data(), Constraints::discreteIntLowerBnds, Constraints::discreteRealLowerBnds, ProblemDescDB::get_rv(), Constraints::linearEqConCoeffs, Constraints::linearEqConTargets, Constraints::linearIneqConCoeffs, Constraints::linearIneqConLowerBnds, Constraints::linearIneqConUpperBnds, Constraints::numLinearEqCons, and Constraints::numLinearIneqCons.

Referenced by Constraints::Constraints().

Constraints * get_constraints ( const ProblemDescDB & problem_db, const SharedVariablesData & svd ) [private]

Used only by the constructor to initialize constraintsRep to the appropriate derived type.

Initializes constraintsRep to the appropriate derived type, as given by the variables view.

References SharedVariablesData::view().

Referenced by Constraints::Constraints(), and Constraints::copy().

Constraints * get_constraints ( const SharedVariablesData & svd ) const [private]

Used by copy() to initialize constraintsRep to the appropriate derived type.

Initializes constraintsRep to the appropriate derived type, as given by the variables view. The default derived class constructors are invoked.

References SharedVariablesData::view().

  *Constructor.*

- **virtual ~DakotaROLObjectiveHess** ()
  
  *Destructor.*

- **void hessVec** (std::vector<Real> &hv, const std::vector<Real> &v, const std::vector<Real> &x, Real &tol) override
  
  *Function to return Hessian-vector product needed by ROL when using user/Dakota-supplied Hessians.*

- **void invHessVec** (std::vector<Real> &hv, const std::vector<Real> &v, const std::vector<Real> &x, Real &tol) override
  
  *This function is not used by ROL algorithms currently supported by Dakota but is included to protect against unexpected behavior.*

Additional Inherited Members

13.36.1 Detailed Description

**DakotaROLObjectiveHess** is derived from **DakotaROLObjectiveGrad**. It implements overrides of ROL member functions to provide a Dakota-specific implementation of a Hessian-vector product. This separate class is needed (rather than putting the product into **DakotaROLObjective**) because logic in ROL does not always protect against calling the Hessian-vector product in cases where there is not actually a Hessian provided.

13.37 DataEnvironment Class Reference

Handle class for environment specification data.
Public Member Functions

- **DataEnvironment ()**
  
  constructor

- **DataEnvironment (const DataEnvironment &)**
  
  copy constructor

- **~DataEnvironment ()**
  
  destructor

- **DataEnvironment & operator= (const DataEnvironment &)**
  
  assignment operator

- **void write (std::ostream &s) const**
  
  write a DataEnvironment object to an std::ostream

- **void read (MPIUnpackBuffer &s)**
  
  read a DataEnvironment object from a packed MPI buffer

- **void write (MPIPackBuffer &s) const**
  
  write a DataEnvironment object to a packed MPI buffer

- **DataEnvironmentRep * data_rep ()**
  
  return dataEnvRep

Private Attributes

- **DataEnvironmentRep * dataEnvRep**
  
  pointer to the body (handle-body idiom)

Friends

- class ProblemDescDB
- class NIDRProblemDescDB

13.37.1 Detailed Description

Handle class for environment specification data.

The DataEnvironment class is used to provide a memory management handle for the data in DataEnvironmentRep. It is populated by IDRProblemDescDB::environment_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A single DataEnvironment object is maintained in ProblemDescDB::environment-Spec.

The documentation for this class was generated from the following files:

- DataEnvironment.hpp
- DataEnvironment.cpp

13.38 DataEnvironmentRep Class Reference

Body class for environment specification data.
Public Attributes

- bool checkFlag
  flag for whether to run in check only mode (default false)
- String outputFile
  file name for output redirection (overrides command-line)
- String errorFile
  file name for error redirection (overrides command-line)
- String readRestart
  file name for restart read (overrides command-line)
- int stopRestart
  record at which to stop reading restart
- String writeRestart
  file name for restart write (overrides command-line)
- bool preRunFlag
  flags invocation with command line option -pre_run
- bool runFlag
  flags invocation with command line option -run
- bool postRunFlag
  flags invocation with command line option -post_run
- String preRunInput
  filename for pre_run input
- String preRunOutput
  filename for pre_run output
- String runInput
  filename for run input
- String runOutput
  filename for run output
- String postRunInput
  filename for post_run input
- String postRunOutput
  filename for post_run output
- unsigned short preRunOutputFormat
  tabular format for pre_run output
- unsigned short postRunInputFormat
  tabular format for post_run input
- bool graphicsFlag
  flags use of graphics by the environment (from the graphics specification in EnvIndControl)
- bool tabularDataFlag
  flags tabular data collection by the environment (from the tabular_graphics_data specification in EnvIndControl)
- String tabularDataFile
  the filename used for tabular data collection by the environment (from the tabular_graphics_file specification in EnvIndControl)
- unsigned short tabularFormat
format for tabular data files (see enum)

- int outputPrecision
  output precision for tabular and screen output
- bool resultsOutputFlag
  flags use of results output to default file
- String resultsOutputFile
  named file for results output
- unsigned short resultsOutputFormat
  Results output format.
- unsigned short modelEvalsSelection
  Model selection for eval storage.
- unsigned short interfEvalsSelection
  Interface selection for eval storage.
- String topMethodPointer
  method identifier for the environment (from the top method pointer specification)

Private Member Functions

- DataEnvironmentRep ()
  constructor
- ~DataEnvironmentRep ()
  destructor
- void write (std::ostream &s) const
  write a DataEnvironmentRep object to an std::ostream
- void read (MPIUnpackBuffer &s)
  read a DataEnvironmentRep object from a packed MPI buffer
- void write (MPIPackBuffer &s) const
  write a DataEnvironmentRep object to a packed MPI buffer

Private Attributes

- int referenceCount
  number of handle objects sharing this dataEnvironmentRep

Friends

- class DataEnvironment
  the handle class can access attributes of the body class directly
13.38.1 Detailed Description

Body class for environment specification data.

The `DataEnvironmentRep` class is used to contain the data from the environment keyword specification. Default values are managed in the `DataEnvironmentRep` constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within `ProblemDescDB` since `ProblemDescDB::environmentSpec` is private.

The documentation for this class was generated from the following files:

- `DataEnvironment.hpp`
- `DataEnvironment.cpp`

13.39 DataFitSurrBasedLocalTraits Class Reference

Class for provably-convergent local surrogate-based optimization and nonlinear least squares.

Inheritance diagram for `DataFitSurrBasedLocalTraits`:

```
       TraitsBase
          |
          +--- DataFitSurrBasedLocalTraits
```

**Public Member Functions**

- `DataFitSurrBasedLocalTraits ()`
  
  *default constructor*

- `virtual ~DataFitSurrBasedLocalTraits ()`
  
  *destructor*

- `virtual bool is_derived ()`
  
  *A temporary query used in the refactor.*

- `bool supports_continuous_variables ()`
  
  *Return the flag indicating whether method supports continuous variables.*

- `bool supports_linear_equality ()`
  
  *Return the flag indicating whether method supports linear equalities.*

- `bool supports_linear_inequality ()`
  
  *Return the flag indicating whether method supports linear inequalities.*

- `bool supports_nonlinear_equality ()`
  
  *Return the flag indicating whether method supports nonlinear equalities.*

- `bool supports_nonlinear_inequality ()`
  
  *Return the flag indicating whether method supports nonlinear inequalities.*
13.39.1 Detailed Description

Class for provably-convergent local surrogate-based optimization and nonlinear least squares.

This minimizer uses a SurrogateModel to perform minimization based on local, global, or hierarchical surrogates. It achieves provable convergence through the use of a sequence of trust regions and the application of surrogate corrections at the trust region centers. A version of TraitsBase specialized for local surrogate-based minimizer

The documentation for this class was generated from the following file:

- DataFitSurrBasedLocalMinimizer.hpp

13.40 DataFitSurrModel Class Reference

Derived model class within the surrogate model branch for managing data fit surrogates (global and local)

Inheritance diagram for DataFitSurrModel:

```
Model
   SurrogateModel
   DataFitSurrModel
```

Public Member Functions

- **DataFitSurrModel (ProblemDescDB &problem_db)**
  
  *constructor*

- **DataFitSurrModel (Iterator &dace_iterator, Model &actual_model, const ActiveSet &set, const String &approx_type, const UShortArray &approx_order, short corr_order, short data_order, short output_level, const String &point_reuse, const String &import_build_points_file=String(), unsigned short import_build_format=TABULAR_ANNOTATED, bool import_build_active_only=false, const String &export_approx_points_file=String(), unsigned short export_approx_format=TABULAR_ANNOTATED)**
  
  *alternate constructor for instantiations on the fly*

- **~DataFitSurrModel ()**
  
  *destructor*

- **void total_points (int points)**
  
  *set pointsTotal and pointsManagement mode*

- **int required_points ()**
  
  *return points required for build according to pointsManagement mode*

- **void declare_sources ()**
  
  *Declare a model’s sources to the evaluationsDB.*
Protected Member Functions

- size_t qoi () const
  return number of unique response functions (managing any aggregations)
- DiscrepancyCorrection & discrepancy_correction ()
  return the DiscrepancyCorrection object used by SurrogateModels
- short correction_type ()
  return the correction type from the DiscrepancyCorrection object used by SurrogateModels
- void correction_type (short corr_type)
  set the correction type from the DiscrepancyCorrection object used by SurrogateModels
- bool initialize_mapping (ParLevLIter pl_iter)
  Perform any global updates prior to individual evaluate() calls.
- bool finalize_mapping ()
  restore state in preparation for next initialization
- void derived_evaluate (const ActiveSet &set)
  portion of evaluate() specific to DataFitSurrModel
- void derived_evaluate_nowait (const ActiveSet &set)
  portion of evaluate_nowait() specific to DataFitSurrModel
- const IntResponseMap & derived_synchronize ()
  portion of synchronize() specific to DataFitSurrModel
- const IntResponseMap & derived_synchronize_nowait ()
  portion of synchronize_nowait() specific to DataFitSurrModel
- void asv_inflate_build (const ShortArray &orig_asv, ShortArray &actual_asv)
  map incoming ASV into actual request for surrogate construction, managing any mismatch in sizes due to response aggregation modes in actualModel
- void asv_split_eval (const ShortArray &orig_asv, ShortArray &actual_asv, ShortArray &approx_asv)
  split incoming ASV into actual and approximate evaluation requests, managing any mismatch in sizes due to response aggregation modes in actualModel
- Iterator & subordinate_iterator ()
  return daceIterator
- void active_model_key (const UShortArray &mi_key)
  set active model key within approxInterface
- void clear_model_keys ()
  remove all model keys within approxInterface
- Model & surrogate_model ()
  return this model instance
- void surrogate_model_key (unsigned short lf_model_index, unsigned short lf_soln_lev_index)
  set the indices that define the active approximation sub-model within surrogate models
- void surrogate_model_key (const UShortArray &lf_key)
  set the index pair that defines the active approximation sub-model within surrogate models
- Model & truth_model ()
  return actualModel
- void truth_model_key (unsigned short hf_model_index, unsigned short hf_soln_lev_index)
  set the indices that define the active truth sub-model within surrogate models
• void truth_model_key (const UShortArray &hf_key)
  set the index pair that defines the active truth sub-model within surrogate models
• void derived_subordinate_models (ModelList &ml, bool recurse_flag)
  return actualModel (and optionally its sub-models)
• void resize_from_subordinate_model (size_t depth=std::numeric_limits<size_t>::max())
  pass request to actualModel if recursing
• void update_from_subordinate_model (size_t depth=std::numeric_limits<size_t>::max())
  pass request to actualModel if recursing and then update from it
• Interface & derived_interface ()
  return approxInterface
• void primary_response_fn_weights (const RealVector &wts, bool recurse_flag=true)
  set the relative weightings for multiple objective functions or least squares terms and optionally recurses into actualModel
• void surrogate_response_mode (short mode)
  set responseMode and pass any bypass request on to actualModel for any lower-level surrogates.
• void link_multilevel_approximation_data ()
  link together more than one SurrogateData instance within approxInterface.functionSurfaces[i].approxData[j]
• void surrogate_function_indices (const IntSet &surr_fn_indices)
  (re)set the surrogate index set in SurrogateModel::surrogateFnIndices and ApproximationInterface::approxFnIndices
• void build_approximation ()
  Builds the local/multipoint/global approximation using dacelIterator/actualModel to generate new data points.
• bool build_approximation (const Variables &vars, const IntResponsePair &response_pr)
  Builds the local/multipoint/global approximation using dacelIterator/actualModel to generate new data points that augment the passed vars/response anchor point.
• void rebuild_approximation ()
  Rebuilds the local/multipoint/global approximation using dacelIterator/actualModel to generate an increment of appended data.
• void update_approximation (bool rebuild_flag)
  replaces the approximation data with dacelIterator results and rebuilds the approximation if requested
• void update_approximation (const Variables &vars, const IntResponsePair &response_pr, bool rebuild_flag)
  replaces the anchor point, and rebuilds the approximation if requested
• void update_approximation (const VariablesArray &vars_array, const IntResponseMap &resp_map, bool rebuild_flag)
  replaces the current points array and rebuilds the approximation if requested
• void update_approximation (const RealMatrix &samples, const IntResponseMap &resp_map, bool rebuild_flag)
  replaces the current points array and rebuilds the approximation if requested
• void append_approximation (bool rebuild_flag)
  appends dacelIterator results to a global approximation and rebuilds it if requested
• void append_approximation (const Variables &vars, const IntResponsePair &response_pr, bool rebuild_flag)
  appends a point to a global approximation and rebuilds it if requested
• void append_approximation (const VariablesArray &vars_array, const IntResponseMap &resp_map, bool rebuild_flag)
appends an array of points to a global approximation and rebuilds it if requested

- **void append_approximation** (const RealMatrix &samples, const IntResponseMap &resp_map, bool rebuild_flag)
  appends a matrix of points to a global approximation and rebuilds it if requested

- **void pop_approximation** (bool save_surr_data, bool rebuild_flag=false)
  remove approximation data added on previous append_approximation() call or a specified number of points

- **void push_approximation** ()
  retrieve a previous approximation data state

- **bool push_available** ()
  query for whether a trial increment can be retrieved

- **void finalize_approximation** ()
  finalize data fit by applying all previous trial increments

- **void combine_approximation** ()
  combine all level approximations into a separate composite approximation

- **void combined_to_active** (bool clear_combined=true)
  promote the combined approximation into the active one

- **void clear_inactive** ()
  clear inactive data stored in the approxInterface

- **void run_dace** ()
  execute the DACE iterator to generate build data

- **SharedApproxData & shared_approximation** ()
  retrieve the SharedApproxData from approxInterface

- **std::vector< Approximation > & approximations** ()
  retrieve the set of Approximations from approxInterface

- **const RealVectorArray & approximation_coefficients** (bool normalized=false)
  return the approximation coefficients from each Approximation (request forwarded to approxInterface)

- **void approximation_coefficients** (const RealVectorArray &approx_coeffs, bool normalized=false)
  set the approximation coefficients within each Approximation (request forwarded to approxInterface)

- **const RealVector & approximation_variances** (const Variables &vars)
  return the approximation variance from each Approximation (request forwarded to approxInterface)

- **const Pecos::SurrogateData & approximation_data** (size_t fn_index, size_t d_index=NPOS)
  return the approximation data from a particular Approximation (request forwarded to approxInterface)

- **void component_parallel_mode** (short mode)
  update component parallel mode for supporting parallelism in actualModel

- **IntIntPair estimate_partition_bounds** (int max_eval_concurrency)
  estimate the minimum and maximum partition sizes that can be utilized by this Model

- **void derived_init_communicators** (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  set up actualModel for parallel operations

- **void derived_init_serial** ()
  set up actualModel for serial operations.

- **void derived_set_communicators** (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  set active parallel configuration within actualModel

- **void derived_free_communicators** (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
deallocate communicator partitions for the DataFitSurrModel (request forwarded to actualModel)

- **void serve_run** (ParLevLIter pl_iter, int max_eval_concurrency)
  
  Service actualModel job requests received from the master. Completes when a termination message is received from stop_servers().

- **void stop_servers** ()
  
  Executed by the master to terminate actualModel server operations when DataFitSurrModel iteration is complete.

- **void inactive_view** (short view, bool recurse_flag=true)
  
  Update the Model’s inactive view based on higher level (nested) context and optionally recurse into actualModel

- **const String & interface_id** () const
  
  Return the approxInterface identifier

- **bool evaluation_cache** (bool recurse_flag=true) const
  
  If recurse_flag, return the actualModel evaluation cache usage

- **bool restart_file** (bool recurse_flag=true) const
  
  If recurse_flag, return the actualModel restart file usage

- **void set_evaluation_reference** ()
  
  Set the evaluation counter reference points for the DataFitSurrModel (request forwarded to approxInterface and actualModel)

- **void fine_grained_evaluation_counters** ()
  
  Request fine-grained evaluation reporting within approxInterface and actualModel

- **void print_evaluation_summary** (std::ostream &s, bool minimal_header=false, bool relative_count=true) const
  
  Print the evaluation summary for the DataFitSurrModel (request forwarded to approxInterface and actualModel)

- **void warm_start_flag** (const bool flag)
  
  Set the warm start flag, including actualModel

- **ActiveSet default_interface_active_set** ()

### Protected Attributes

- **const bool exportSurrogate**
  
  Whether to export the surrogate to file

- **const bool autoRefine**
  
  Whether to automatically refine the surrogate during the build phase

- **const int maxIterations**
  
  Maximum number of times to refine the surrogate.

- **const int maxFuncEvals**
  
  Maximum number of evaluations while refining a surrogate.

- **const Real convergenceTolerance**
  
  Convergence criterion, compared to CV score for specified metric.

- **const int softConvergenceLimit**
  
  Max number of iterations for which there is no average improvement.

- **const String refineCVMetric**
  
  Type of error metric to test for surrogate refinement convergence.

- **const int refineCVFolds**
  
  Number of cross validation folds for surrogate refinement.
Private Member Functions

- void import_points (unsigned short tabular_format, bool active_only)
  optionally read surrogate data points from provided file

- void initialize_export ()
  initialize file stream for exporting surrogate evaluations

- void finalize_export ()
  finalize file stream for exporting surrogate evaluations

- void export_point (int eval_id, const Variables &vars, const Response &resp)
  initialize file stream for exporting surrogate evaluations

- void derived_synchronize_approx (bool block, IntResponseMap &approx_res_map_rekey)
  Common code for processing of approximate response maps shared by derived_synchronize() and derived_synchronize_nowait()

- void update_local_reference ()
  Updates fit arrays for local or multipoint approximations.

- void build_local_multipoint ()
  Builds a local or multipoint approximation using actualModel.

- void build_local_multipoint (const Variables &vars, const IntResponsePair &response_pr)
  Builds a local or multipoint approximation using actualModel.

- void update_global_reference ()
  Updates fit arrays for global approximations.

- void build_global ()
  Builds a global approximation using daceIterator.

- void rebuild_global ()
  Rebuilds a global approximation by generating new data using daceIterator and appending to approxInterface.

- void refine_surrogate ()
  Refine the built surrogate until convergence criteria are met.

- void clear_approx_interface ()
  clear current data from approxInterface

- void update_approx_interface (const Variables &vars, const IntResponsePair &response_pr)
  update anchor data in approxInterface

- void build_approx_interface ()
  build the approxInterface surrogate, passing variable bounds

- void init_model (Model &model)
  update actualModel with data from constraints/labels/sets

- void update_model (Model &model)
  update actualModel with data from current variables(bounds

- void update_from_model (const Model &model)
  update current variables/labels/bounds/targets with data from actualModel

- bool consistent (const Variables &vars) const
  test if inactive state is consistent

- bool inside (const Variables &vars) const
  test if active vars are within [l_bnds, u_bnds]

- bool active_vars_compare (const Variables &vars, const Pecos::SurrogateDataVars &sdv) const
  test for exact equality in values between active vars and sdv
Private Attributes

- **DiscrepancyCorrection deltaCorr**
  manages construction and application of correction functions that are applied to a surrogate model (DataFitSurr or HierarchSurr) in order to reproduce high fidelity data.

- **int pointsTotal**
  total points the user specified to construct the surrogate

- **short pointsManagement**
  configuration for points management in `build_global()`

- **String pointReuse**
  type of point reuse for approximation builds: all, region (default if points file), or none (default if no points file)

- **String importPointsFile**
  file name from `import_build_points_file` specification

- **String exportPointsFile**
  file name from `export_approx_points_file` specification

- **unsigned short exportFormat**
  file export format for variables and approximate responses

- **std::ofstream exportFileStream**
  output file stream for `export_approx_points_file` specification

- **Interface approxInterface**
  manages the building and subsequent evaluation of the approximations (required for both global and local)

- **Model actualModel**
  the truth model which provides evaluations for building the surrogate (optional for global, required for local)

- **Iterator daceIterator**
  selects parameter sets on which to evaluate actualModel in order to generate the necessary data for building global approximations (optional for global since restart data may also be used)

Additional Inherited Members

13.40.1 Detailed Description

Derived model class within the surrogate model branch for managing data fit surrogates (global and local)

The **DataFitSurrModel** class manages global or local approximations (surrogates that involve data fits) that are used in place of an expensive model. The class contains an approxInterface (required for both global and local) which manages the approximate function evaluations, an actualModel (optional for global, required for local) which provides truth evaluations for building the surrogate, and a daceIterator (optional for global, not used for local) which selects parameter sets on which to evaluate actualModel in order to generate the necessary data for building global approximations.

13.40.2 Constructor & Destructor Documentation

```cpp
~DataFitSurrModel() [inline]
```

destructor

Virtual destructor handles referenceCount at base **Model** level.

References **DataFitSurrModel::exportPointsFile**, and **DataFitSurrModel::finalize_export()**.
13.40.3 Member Function Documentation

**bool finalize_mapping()** [protected], [virtual]

restore state in preparation for next initialization

Inactive variables must be propagated when a HierarchSurrModel is employed by a sub-iterator (e.g., OUU with MLMC or MLPCE). In current use cases, this can occur once per sub-iterator execution within Model::initialize_mapping().

Reimplemented from Model.

References DataFitSurrModel::actualModel, SurrogateModel::finalize_mapping(), and Model::finalize_mapping().

**void derived_evaluate ( const ActiveSet & set )** [protected], [virtual]

portion of evaluate() specific to DataFitSurrModel

Compute the response synchronously using actualModel, approxInterface, or both (mixed case). For the approxInterface portion, build the approximation if needed, evaluate the approximate response, and apply correction (if active) to the results.

Reimplemented from Model.

References Response::active_set(), DataFitSurrModel::actualModel, SurrogateModel::aggregate_response(), Interface::analysis_components(), DiscrepancyCorrection::apply(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, DataFitSurrModel::asv_split_eval(), DataFitSurrModel::build_approximation(), DataFitSurrModel::component_parallel_mode(), DiscrepancyCorrection::compute(), Response::copy(), Model::current_response(), Model::currentResponse, Model::currentVariables, DataFitSurrModel::deltaCorr, Model::eval_tag_prefix(), Model::evalTagPrefix, Model::evaluate(), Interface::evaluation_id(), Model::evaluationsDB, DataFitSurrModel::export_point(), DataFitSurrModel::exportPointsFile, SurrogateModel::force_rebuild(), Model::hierarchicalTagging, Interface::interface_id(), Model::interfEvaluationsDBState, Interface::map(), Model::modelId, Model::outputLevel, ActiveSet::request_vector(), SurrogateModel::response_combine(), SurrogateModel::responseMode, SurrogateModel::surrModelEvalCntr, Response::update(), and DataFitSurrModel::update_model().

**void derived_evaluate_nowait ( const ActiveSet & set )** [protected], [virtual]

portion of evaluate_nowait() specific to DataFitSurrModel

Compute the response asynchronously using actualModel, approxInterface, or both (mixed case). For the approxInterface portion, build the approximation if needed and evaluate the approximate response in a quasi-asynchronous approach (ApproximationInterface::map() performs the map synchronously and bookkeeps the results for return in derived_syncronize() below).

Reimplemented from Model.

References DataFitSurrModel::actualModel, Interface::analysis_components(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, DataFitSurrModel::asv_split_eval(), DataFitSurrModel::build_approximation(), Variables::copy(), Model::currentResponse, Model::currentVariables, Model::eval_tag_prefix(), Model::evalTagPrefix, Model::evaluate_nowait(), Interface::evaluation_id(), Model::evaluation_id(), Model::evaluationsDB, DataFitSurrModel::exportPointsFile, SurrogateModel::force_rebuild(), Model::hierarchicalTagging, Interface::interface_id(), Model::interfEvaluationsDBState, Interface::map(), Model::modelId, SurrogateModel::rawVarsMap, ActiveSet::request_vector(), SurrogateModel::response_combine(), SurrogateModel::responseMode, SurrogateModel::surrIdMap, SurrogateModel::surrModelEvalCntr, SurrogateModel::truthIdMap, and DataFitSurrModel::update_model().

**const IntResponseMap & derived_syncronize()** [protected], [virtual]

portion of synchronize() specific to DataFitSurrModel

Blocking retrieval of asynchronous evaluations from actualModel, approxInterface, or both (mixed case). For the approxInterface portion, apply correction (if active) to each response in the array. derived_syncronize() is
13.40. DATAFITSURRMODEL CLASS REFERENCE

designed for the general case where derived\_evaluate\_nowait() may be inconsistent in its use of actual evaluations, approximate evaluations, or both.

Reimplemented from Model.

References DataFitSurrModel::actualModel, SurrogateModel::aggregate\_response(), SurrogateModel::check\_key(), DataFitSurrModel::component\_parallel\_mode(), DiscrepancyCorrection::compute(), DataFitSurrModel::deltaCorr, DataFitSurrModel::derived\_synchronize\_approx(), Model::outputLevel, Model::rekey\_synch(), SurrogateModel::response\_combine(), SurrogateModel::response\_mode, SurrogateModel::surrIdMap, SurrogateModel::surrResponseMap, and SurrogateModel::truthIdMap.

**const IntResponseMap & derived\_synchronize\_nowait()**  **[protected]**, **[virtual]**

portion of synchronize\_nowait() specific to DataFitSurrModel

Nonblocking retrieval of asynchronous evaluations from actualModel, approxInterface, or both (mixed case). For the approxInterface portion, apply correction (if active) to each response in the map. derived\_synchronize\_nowait() is designed for the general case where derived\_evaluate\_nowait() may be inconsistent in its use of actual evals, approx evals, or both.

Reimplemented from Model.

References Dakota::abort\_handler(), DataFitSurrModel::actualModel, SurrogateModel::aggregate\_response(), SurrogateModel::cached\_approx\_respMap, DataFitSurrModel::component\_parallel\_mode(), DiscrepancyCorrection::compute(), DataFitSurrModel::deltaCorr, DataFitSurrModel::derived\_synchronize\_approx(), Model::outputLevel, Model::rekey\_synch(), SurrogateModel::response\_combine(), SurrogateModel::response\_mode, SurrogateModel::surrIdMap, SurrogateModel::surrResponseMap, and SurrogateModel::truthIdMap.

**void build\_approximation()**  **[protected]**, **[virtual]**

Builds the local/multipoint/global approximation using daceIterator/actualModel to generate new data points.

This function constructs a new approximation, discarding any previous data. It constructs any required data for SurrogateData::\{vars,resp\}Data and does not define an anchor point for SurrogateData::anchor\{Vars,Resp\}, so is an unconstrained build.

Reimplemented from Model.

References DataFitSurrModel::actualModel, DataFitSurrModel::build\_global(), DataFitSurrModel::build\_local\_multipoint(), DataFitSurrModel::clear\_approx\_interface(), Dakota::strbegins(), Model::surrogate\_type, DataFitSurrModel::update\_global\_reference(), DataFitSurrModel::update\_local\_reference(), and DataFitSurrModel::update\_model().

Referenced by DataFitSurrModel::derived\_evaluate(), and DataFitSurrModel::derived\_evaluate\_nowait().

**bool build\_approximation ( const Variables & vars, const IntResponsePair & response\_pr )**  **[protected]**, **[virtual]**

Builds the local/multipoint/global approximation using daceIterator/actualModel to generate new data points that augment the passed vars/response anchor point.

This function constructs a new approximation, discarding any previous data. It uses the passed data to populate SurrogateData::anchor\{Vars,Resp\} and constructs any required data points for SurrogateData::\{vars,resp\}Data.

Reimplemented from Model.

References DataFitSurrModel::actualModel, DataFitSurrModel::build\_global(), DataFitSurrModel::build\_local\_multipoint(), Dakota::strbegins(), Model::surrogate\_type, DataFitSurrModel::update\_approx\_interface(), DataFitSurrModel::update\_global\_reference(), DataFitSurrModel::update\_local\_reference(), and DataFitSurrModel::update\_model().
void rebuild_approximation( ) [protected], [virtual]

Rebuilds the local/multipoint/global approximation using daceIterator/actualModel to generate an increment of appended data.

This function updates an existing approximation, by appending new data. It does not define an anchor point, so is an unconstrained build.

Reimplemented from Model.

References DataFitSurrModel::actualModel, DataFitSurrModel::build_local_multipoint(), Model::outputLevel, DataFitSurrModel::rebuild_global(), Dakota::strbegins(), Model::surrogateType, and DataFitSurrModel::update_model().

void update_approximation( bool rebuild_flag ) [protected], [virtual]

replaces the approximation data with daceIterator results and rebuilds the approximation if requested

This function populates/replaces SurrogateData::anchor{Vars,Resp} and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData::{vars,resp}Data) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.

References Iterator::all_responses(), Iterator::all_samples(), Iterator::all_variables(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Iterator::compact_mode(), DataFitSurrModel::daceIterator, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), Model::surrogateType, and Interface::update_approximation().

void update_approximation( const Variables & vars, const IntResponsePair & response, bool rebuild_flag ) [protected], [virtual]

replaces the anchor point, and rebuilds the approximation if requested

This function populates/replaces SurrogateData::anchor{Vars,Resp} and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData::{vars,resp}Data) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.

References SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), Model::surrogateType, and Interface::update_approximation().

void update_approximation( const VariablesArray & vars_array, const IntResponseMap & resp_map, bool rebuild_flag ) [protected], [virtual]

replaces the current points array and rebuilds the approximation if requested

This function populates/replaces SurrogateData::{vars,resp}Data and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData::anchor{Vars,Resp}) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.

References SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), Model::surrogateType, and Interface::update_approximation().
void update_approximation ( const RealMatrix & samples, const IntResponseMap & resp_map, bool rebuild_flag ) [protected], [virtual]

replaces the current points array and rebuilds the approximation if requested

This function populates/represents SurrogateData::\{vars,resp\} Data and rebuilds the approximation, if requested. It does not clear other data (i.e., SurrogateData::anchor\{Vars,Resp\}) and does not update the actualModel with revised bounds, labels, etc. Thus, it updates data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.
References SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), Model::surrogateType, and Interface::update_approximation().

void append_approximation ( bool rebuild_flag ) [protected], [virtual]

appends daceIterator results to a global approximation and rebuilds it if requested

This function appends all\{Samples,Variables,Responses\} to SurrogateData::\{vars,resp\} Data and rebuilds the approximation, if requested.

Reimplemented from Model.
References Iterator::all_responses(), Iterator::all_samples(), Iterator::all_variables(), Interface::append_approximation(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Iterator::compact_mode(), DataFitSurrModel::daceIterator, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), and Model::surrogateType.

Referenced by DataFitSurrModel::build_global(), DataFitSurrModel::rebuild_global(), and DataFitSurrModel::refine_surrogate().

void append_approximation ( const Variables & vars, const IntResponsePair & response_pr, bool rebuild_flag ) [protected], [virtual]

appends a point to a global approximation and rebuilds it if requested

This function appends one point to SurrogateData::\{vars,resp\} Data and rebuilds the approximation, if requested. It does not modify other data (i.e., SurrogateData::anchor\{Vars,Resp\}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.
References Interface::append_approximation(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), and Model::surrogateType.

void append_approximation ( const VariablesArray & vars_array, const IntResponseMap & resp_map, bool rebuild_flag ) [protected], [virtual]

appends an array of points to a global approximation and rebuilds it if requested

This function appends multiple points to SurrogateData::\{vars,resp\} Data and rebuilds the approximation, if requested. It does not modify other data (i.e., SurrogateData::anchor\{Vars,Resp\}) and does not update the actualModel with revised bounds, labels, etc. Thus, it appends to data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.
References Interface::append_approximation(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), and Model::surrogateType.
void append_approximation ( const RealMatrix & samples, const IntResponseMap & resp_map, bool rebuild_flag ) [protected], [virtual]

appends a matrix of points to a global approximation and rebuilds it if requested.

This function appends multiple points to SurrogateData::{vars,resp}Data and rebuilds the approximation, if requested. It does not modify other data (i.e., SurrogateData::anchor{Vars,Resp}) and does not update the actual-Model with revised bounds, labels, etc. Thus, it appends to data from a previous call to build_approximation(), and is not intended to be used in isolation.

Reimplemented from Model.

References Interface::append_approximation(), SurrogateModel::approxBuilds, DataFitSurrModel::approxInterface, Model::numFns, Model::outputLevel, Interface::rebuild_approximation(), and Model::surrogateType.

void derived_init_communicators ( ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag = true ) [protected], [virtual]

set up actualModel for parallel operations

asynchronous flags need to be initialized for the sub-models. In addition, max_eval_concurrency is the outer level iterator concurrency, not the DACE concurrency that actualModel will see, and recomputing the message-lengths on the sub-model is probably not a bad idea either. Therefore, recompute everything on actualModel using init_communicators.

Reimplemented from Model.

References DataFitSurrModel::actualModel, DataFitSurrModel::approxInterface, DataFitSurrModel::daceIterator, Model::derivative_concurrency(), ProblemDescDB::get_db_method_node(), ProblemDescDB::get_db_model_node(), Iterator::init_communicators(), Model::init_communicators(), Iterator::is_null(), Model::is_null(), Iterator::iterated_model(), Iterator::maximum_evaluation_concurrency(), Iterator::method_id(), Interface::minimum_points(), Model::model_id(), Model::probDescDB, ProblemDescDB::set_db_list_nodes(), ProblemDescDB::set_db_method_node(), and ProblemDescDB::set_db_model_nodes().

void import_points ( unsigned short tabular_format, bool active_only ) [private]

optionally read surrogate data points from provided file

Constructor helper to read the points file once, if provided, and then reuse its data as appropriate within build_global(). Surrogate data imports default to active/inactive variables, but user can override to active only process arrays of data from TabularIO::read.data_tabular() above

References DataFitSurrModel::actualModel, Response::copy(), Variables::copy(), Model::current_response(), Model::current_variables(), Model::currentResponse, Model::currentVariables, Variables::cv(), Dakota::data_pairs, Variables::div(), Variables::drv(), Variables::dsv(), ParamResponsePair::eval_id(), Model::evaluation_cache(), DataFitSurrModel::importPointsFile, ParamResponsePair::interface_id(), Model::interface_id(), Model::is_null(), Model::numFns, Model::outputLevel, Model::parallelLib, Model::restart_file(), Variables::tv(), and ParallelLibrary::write_restart().

Referenced by DataFitSurrModel::DataFitSurrModel().

void initialize_export ( ) [private]

initialize file stream for exporting surrogate evaluations

Constructor helper to export approximation-based evaluations to a file.

References Model::currentResponse, Model::currentVariables, DataFitSurrModel::exportFileStream, DataFitSurrModel::exportFormat, and DataFitSurrModel::exportPointsFile.

Referenced by DataFitSurrModel::DataFitSurrModel().
void finalize_export ( ) [private]

finalize file stream for exporting surrogate evaluations

Constructor helper to export approximation-based evaluations to a file.
References DataFitSurrModel::exportFileStream, and DataFitSurrModel::exportPointsFile.
Referenced by DataFitSurrModel::~DataFitSurrModel().

void export_point ( int eval_id, const Variables & vars, const Response & resp ) [private]

initialize file stream for exporting surrogate evaluations

Constructor helper to export approximation-based evaluations to a file. Exports all variables, so it's clear at what values of inactive it was built at
References DataFitSurrModel::exportFileStream, DataFitSurrModel::exportFormat, DataFitSurrModel::interface_id(), Model::iterator_space_to_user_space(), and Model::recastings().
Referenced by DataFitSurrModel::derived_evaluate(), and DataFitSurrModel::derived_sync_approx().

void build_local_multipoint ( ) [private]

Builds a local or multipoint approximation using actualModel.

Evaluate the value, gradient, and possibly Hessian needed for a local or multipoint approximation using actualModel.
References Response::active_set(), DataFitSurrModel::actualModel, DataFitSurrModel::asv_inflate_build(), DataFitSurrModel::component_parallel_mode(), Model::continuous_variable_ids(), Model::current_response(), Model::current_variables(), ActiveSet::derivative_vector(), Model::evaluate(), Model::evaluation_id(), Model::hessian_type(), Model::numFns, ActiveSet::request_vector(), Dakota::strbegins(), SurrogateModel::surrogateFnIndices, and Model::surrogateType.
Referenced by DataFitSurrModel::build_approximation(), and DataFitSurrModel::rebuild_approximation().

void build_global ( ) [private]

Builds a global approximation using daceIterator.

Determine points to use in building the approximation and then evaluate them on actualModel using daceIterator. Any changes to the bounds should be performed by setting them at a higher level (e.g., SurrBasedOptStrategy).
References Dakota::abort_handler(), DataFitSurrModel::active_vars_compare(), DataFitSurrModel::actualModel, Interface::append_approximation(), DataFitSurrModel::append_approximation(), SurrogateModel::approxBuilds, Interface::approximation_data(), DataFitSurrModel::approxInterface, DataFitSurrModel::autoRefine, DataFitSurrModel::build_approx_interface(), DataFitSurrModel::component_parallel_mode(), DataFitSurrModel::consistent(), Model::currentVariables, Variables::cv(), Model::cv(), DataFitSurrModel::daceIterator, Dakota::data_pairs, Variables::div(), Model::div(), Variables::drv(), Model::drv(), DataFitSurrModel::inside(), Model::interface_id(), Iterator::is_null(), Interface::minimum_points(), Iterator::num_samples(), Model::outputLevel, DataFitSurrModel::pointReuse, Model::recastings(), DataFitSurrModel::refine_surrogate(), DataFitSurrModel::required_points(), DataFitSurrModel::run_dace(), Iterator::sampling_reset(), SurrogateModel::surrogateFnIndices, and Model::user_space_to_iterator_space().
Referenced by DataFitSurrModel::build_approximation().

void rebuild_global ( ) [private]

Rebuilds a global approximation by generating new data using daceIterator and appending to approxInterface.

Determine points to use in rebuilding the approximation and then evaluate them on actualModel using daceIterator. Assumes data imports/reuse have been handled previously within build_global().
References Dakota::abort_handler(), DataFitSurrModel::append_approximation(), Interface::approximation_data(), DataFitSurrModel::approxInterface, DataFitSurrModel::component_parallel_mode(), DataFitSurrModel::daceIterator, Iterator::is_null(), Interface::minimum_points(), Iterator::num_samples(), Model::outputLevel, DataFitSurrModel::required_points(), DataFitSurrModel::run_dace(), Iterator::sampling_reset(), and SurrogateModel::surrogateFnIndices.

Referenced by DataFitSurrModel::rebuild_approximation().

```cpp
void init_model ( Model & model ) [private]
```

update actualModel with data from constraints/labels/sets

Update variables and constraints data within model using values and labels from currentVariables and bound/linear/nonlinear constraints from userDefinedConstraints.

References Dakota::abort_handler(), Model::aleatDistParams, Model::aleatory_distribution_parameters(), Variables::all_continuous_variable_labels(), Model::all_continuous_variable_labels(), Variables::all_discrete_int_variable_labels(), Model::all_discrete_int_variable_labels(), Variables::all_discrete_real_variable_labels(), Model::all_discrete_real_variable_labels(), SurrogateModel::approxBuilds, Variables::continuous_variable_labels(), Model::continuous_variable_labels(), Model::current_variables(), Model::currentResponse, Model::currentVariables, Variables::cv(), Model::cv(), Model::discrete_design_set_int_values(), Model::discrete_design_set_real_values(), Variables::discrete_int_variable_labels(), Model::discrete_int_variable_labels(), Variables::discrete_real_variable_labels(), Model::discrete_real_variable_labels(), Model::discrete_state_set_int_values(), Model::discrete_state_set_real_values(), Model::discreteDesignSetIntValues, Model::discreteDesignSetRealValues, Model::discreteStateSetIntValues, Model::discreteStateSetRealValues, Variables::div(), Model::div(), Variables::drv(), Model::drv(), Model::epistDistParams, Model::epistemic_distribution_parameters(), Response::function_labels(), SharedVariablesData::id(), Variables::inactive_continuous_variable_labels(), Variables::inactive_continuous_variable_labels(), Variables::inactive_discrete_int_variable_labels(), Model::inactive_discrete_int_variable_labels(), Model::inactive_discrete_real_variable_labels(), Model::inactive_discrete_real_variable_labels(), Model::is_null(), Constraints::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_coeffs(), Constraints::linear_eq_constraint_coeff(), Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_coeffs(), Constraints::linear_eq_constraint_lower_bounds(), Model::linear_eq_constraint_lower_bounds(), Constraints::linear_eq_constraint_upper_bounds(), Model::linear_eq_constraint_upper_bounds(), Constraints::linear_eq_constraint_upper_bounds(), Constraints::linear_eq_constraint_upper_bounds(), Constraints::linear_eq_constraints(), Constraints::num_linear_eq_constraints(), Constraints::num_nonlinear_eq_constraints(), Constraints::num_nonlinear_eq_constraints(), Model::response_labels(), Variables::shared_data(), Model::userDefinedConstraints, and Variables::view();

Referenced by DataFitSurrModel::initialize() and Variables::view().

```cpp
void update_model ( Model & model ) [private]
```

update actualModel with data from current variables/bounds

Update variables and constraints data within model using values and labels from currentVariables and bound/linear/nonlinear constraints from userDefinedConstraints.

References Dakota::abort_handler(), Constraints::all_continuous_lower_bounds(), Model::all_continuous_lower_bounds(), Constraints::all_continuous_upper_bounds(), Model::all_continuous_upper_bounds(), Variables::all_continuous_variables(), Model::all_continuous_variables(), Constraints::all_discrete_int_lower_bounds(), Model::all_discrete_int_lower_bounds(), Constraints::all_discrete_int_upper_bounds(), Model::all_discrete_int_upper_bounds(), Variables::all_discrete_int_variables(), Model::all_discrete_int_variables(), Constraints::all_discrete_real_lower_bounds(), Model::all_discrete_real_lower_bounds(), Constraints::all_discrete_real_lower_bounds(), Model::all_discrete_real_upper_bounds(), Model::all_discrete_real_upper_bounds(), Variables::all_discrete_real_variables(), Model::all_discrete_real_variables(), Constraints::continuous_lower_bounds(), Model::continuous_lower_bound(), Constraints::continuous_upper_bound(), Model::continuous_upper_bound();

13.40.4 Member Data Documentation

**Model actualModel [private]**

the truth model which provides evaluations for building the surrogate (optional for global, required for local) actualModel is unrestricted in type; arbitrary nestings are possible.
13.41 DataInterface Class Reference

Handle class for interface specification data.

**Public Member Functions**

- **DataInterface ()**
  constructor

- **DataInterface (const DataInterface &)**
  copy constructor

- **~DataInterface ()**
  destructor

- **DataInterface & operator= (const DataInterface &)**
  assignment operator

- **void write (std::ostream &s) const**
  write a DataInterface object to an std::ostream

- **void read (MPIUnpackBuffer &s)**
  read a DataInterface object from a packed MPI buffer

- **void write (MPIPackBuffer &s) const**
  write a DataInterface object to a packed MPI buffer

- **DataInterfaceRep *data_rep ()**
  return dataRep

**Static Public Member Functions**

- static bool id_compare (const DataInterface &di, const std::string &id)
  compares the idInterface attribute of DataInterface objects
Private Attributes

- DataInterfaceRep * dataifaceRep
  
  pointer to the body (handle-body idiom)

Friends

- class ProblemDescDB
- class NIDRProblemDescDB

13.41.1 Detailed Description

Handle class for interface specification data.

The DataInterface class is used to provide a memory management handle for the data in DataInterface-Rep. It is populated by IDRProblemDescDB::interface_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of DataInterface objects is maintained in ProblemDescDB::dataInterfaceList, one for each interface specification in an input file.

The documentation for this class was generated from the following files:

- DataInterface.hpp
- DataInterface.cpp

13.42 DataMethod Class Reference

Handle class for method specification data.

Public Member Functions

- DataMethod ()
  
  constructor

13.42.1 Detailed Description

Handle class for method specification data.

The DataMethod class is used to provide a memory management handle for the data in DataMethodRep. It is populated by IDRProblemDescDB::method_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of DataMethod objects is maintained in ProblemDescDB::dataMethodList, one for each method specification in an input file.

The documentation for this class was generated from the following files:

- DataMethod.hpp
- DataMethod.cpp

13.43 DataMethodRep Class Reference

Body class for method specification data.

Public Attributes

- String idMethod
  string identifier for the method specification data set (from the id_method specification in MethodIndControl)
- String modelPointer
  string pointer to the model specification to be used by this method (from the model_pointer specification in MethodIndControl)
- String lowFidModelPointer
  string to point to the low fidelity model for Bayesian experimental design
- short methodOutput
  method verbosity control: {SILENT, QUIET, NORMAL, VERBOSE, DEBUG}.OUTPUT (from the output specification in MethodIndControl)
- int maxIterations
  maximum number of iterations allowed for the method (from the max_iterations specification in MethodIndControl)
- int maxRefineIterations
maximum number of refinement iterations allowed for a uniform/adaptive refinement approach (from the `max_refinement_iterations` specification in `MethodIndControl`)

- `int` `maxSolverIterations`
  maximum number of internal solver iterations allowed for the method (from the `max_solver_iterations` specification in `MethodIndControl`)

- `int` `maxFunctionEvaluations`
  maximum number of function evaluations allowed for the method (from the `max_function_evaluations` specification in `MethodIndControl`)

- `bool` `speculativeFlag`
  flag for use of speculative gradient approaches for maintaining parallel load balance during the line search portion of optimization algorithms (from the `speculative` specification in `MethodIndControl`)

- `bool` `methodUseDerivsFlag`
  flag for usage of derivative data to enhance the computation of surrogate models (PCE/SC expansions, GP models for EGO/EGRA/EGIE) based on the `use_derivatives` specification

- `Real` `convergenceTolerance`
  iteration convergence tolerance for the method (from the `convergence_tolerance` specification in `MethodIndControl`)

- `Real` `constraintTolerance`
  tolerance for controlling the amount of infeasibility that is allowed before an active constraint is considered to be violated (from the `constraint_tolerance` specification in `MethodIndControl`)

- `bool` `methodScaling`
  flag indicating scaling status (from the `scaling` specification in `MethodIndControl`)

- `size_t` `numFinalSolutions`
  number of final solutions returned from the iterator

- `unsigned short` `methodName`
  the method selection: one of the optimizer, least squares, nond, dace, or parameter study methods

- `unsigned short` `subMethod`
  enum value for a sub-method type

- `String` `subMethodName`
  string identifier for a sub-method name within a multi-option method specification (e.g., from meta-iterators)

- `String` `subModelPointer`
  string pointer for a sub-model specification used by a meta-iterator

- `String` `subMethodPointer`
  string pointer for a sub-method specification used by a meta-iterator

- `int` `iteratorServers`
  number of servers for concurrent iterator parallelism (from the `iterator_servers` specification)

- `int` `procsPerIterator`
  number of processors for each concurrent iterator partition (from the `processors_per_iterator` specification)

- `short` `iteratorScheduling`
  type of scheduling ([`DEFAULT`, `MASTER`, `PEER`]_SCHEDULING) used in concurrent iterator parallelism (from the `iterator_scheduling` specification)

- `StringArray` `hybridMethodNames`
  array of methods for the sequential and collaborative hybrid meta-iterations (from the `method_name_list` specification)
• StringArray hybridModelPointers
  array of models for the sequential and collaborative hybrid meta-iterators (from the model_pointer_list specification)

• StringArray hybridMethodPointers
  array of methods for the sequential and collaborative hybrid meta-iterators (from the method_pointer_list specification)

• String hybridGlobalMethodName
  global method name for embedded hybrids (from the global_method_name specification)

• String hybridGlobalModelPointer
  global model pointer for embedded hybrids (from the global_model_pointer specification)

• String hybridGlobalMethodPointer
  global method pointer for embedded hybrids (from the global_method_pointer specification)

• String hybridLocalMethodName
  local method name for embedded hybrids (from the local_method_name specification)

• String hybridLocalModelPointer
  local model pointer for embedded hybrids (from the local_model_pointer specification)

• String hybridLocalMethodPointer
  local method pointer for embedded hybrids (from the local_method_pointer specification)

• Real hybridLSProb
  local search probability for embedded hybrids (from the local_search_probability specification)

• int concurrentRandomJobs
  number of random jobs to perform in the pareto_set and multi_start meta-iterators (from the random_starts and random_weight_sets specifications)

• RealVector concurrentParameterSets
  user-specified (i.e., nonrandom) parameter sets to evaluate in the pareto_set and multi_start meta-iterators (from the starting_points and weight_sets specifications)

• unsigned short softConvLimit
  number of consecutive iterations with change less than convergenceTolerance required to trigger convergence

• bool surrBasedLocalLayerBypass
  flag to indicate user-specification of a bypass of any/all layerings in evaluating truth response values in SBL.

• RealVector trustRegionInitSize
  initial trust region sizes in the surrogate-based local method (from the initial_size specification in MethodSBL), one size per surrogate model (notes: no trust region for the truth model; sizes are relative values, e.g., 0.1 = 10% of range of global bounds for each variable

• Real trustRegionMinSize
  minimum trust region size in the surrogate-based local method (from the minimum_size specification in MethodSBL), if the trust region size falls below this threshold the SBL iterations are terminated (note: if kriging is used with SBL, the min trust region size is set to 1.0e-3 in attempt to avoid ill-conditioned matrixes that arise in kriging over small trust regions)

• Real trustRegionContractTrigger
  trust region minimum improvement level (ratio of actual to predicted decrease in objective fcn) in the surrogate-based local method (from the contract_threshold specification in MethodSBL), the trust region shrinks or is rejected if the ratio is below this value ("eta_1" in the Conn-Gould-Toint trust region book)

• Real trustRegionExpandTrigger
trust region sufficient improvement level (ratio of actual to predicted decrease in objective fn) in the surrogate-based local method (from the `expand_threshold` specification in MethodSBL), the trust region expands if the ratio is above this value ("eta\_2" in the Conn-Gould-Toint trust region book)

- Real `trustRegionContract`
  trust region contraction factor in the surrogate-based local method (from the `contraction_factor` specification in MethodSBL)

- Real `trustRegionExpand`
  trust region expansion factor in the surrogate-based local method (from the `expansion_factor` specification in MethodSBL)

- Short `surrBasedLocalSubProbObj`
  SBL approximate subproblem objective: ORIGINAL\_PRIMARY, SINGLE\_OBJECTIVE, LAGRANGIAN\_OBJECTIVE, or AUGMENTED\_LAGRANGIAN\_OBJECTIVE.

- Short `surrBasedLocalSubProbCon`
  SBL approximate subproblem constraints: NO\_CONSTRAINTS, LINEARIZED\_CONSTRAINTS, or ORIGINAL\_CONSTRAINTS.

- Short `surrBasedLocalMeritFn`
  SBL merit function type: BASIC\_PENALTY, ADAPTIVE\_PENALTY, BASIC\_LAGRANGIAN, or AUGMENTED\_LAGRANGIAN.

- Short `surrBasedLocalAcceptLogic`
  SBL iterate acceptance logic: TR\_RATIO or FILTER.

- Short `surrBasedLocalConstrRelax`
  SBL constraint relaxation method: NO\_RELAX or HOMOTOPY.

- Bool `surrBasedGlobalReplacePts`
  user-specified method for adding points to the set upon which the next surrogate is based in the surrogate-based global method.

- String `dllDetails`
  string of options for a dynamically linked solver

- Void * `dllLib`
  handle to dynamically loaded library

- Int `verifyLevel`
  the `verify_level` specification in MethodNPSOLDC

- Real `functionPrecision`
  the `function_precision` specification in MethodNPSOLDC and the EPSILON specification in NOMAD

- Real `lineSearchTolerance`
  the `linesearch_tolerance` specification in MethodNPSOLDC

- Real `absConvTol`
  absolute function convergence tolerance

- Real `xConvTol`
  x-convergence tolerance

- Real `singConvTol`
  singular convergence tolerance

- Real `singRadius`
  radius for singular convergence test

- Real `falseConvTol`
  false-convergence tolerance
- Real initTRRadius
  initial trust radius
- int covarianceType
  kind of covariance required
- bool regressDiag
  whether to print the regression diagnostic vector
- String searchMethod
  the search method specification for Newton and nonlinear interior-point methods in MethodOPTPPDC
- Real gradientTolerance
  the gradient tolerance specification in MethodOPTPPDC
- Real maxStep
  the max_step specification in MethodOPTPPDC
- short meritFn
  the merit function specification for nonlinear interior-point methods in MethodOPTPPDC
- Real stepLenToBoundary
  the stepLen_to_boundary specification for nonlinear interior-point methods in MethodOPTPPDC
- Real centeringParam
  the centering parameter specification for nonlinear interior-point methods in MethodOPTPPDC
- int searchSchemeSize
  the search_scheme_size specification for PDS methods in MethodOPTPPDC
- Real initStepLength
  the initStepLength choice for nonlinearly constrained APPS in MethodAPPSDC
- Real contractStepLength
  the contractStepLength choice for nonlinearly constrained APPS in MethodAPPSDC
- Real threshStepLength
  the threshStepLength choice for nonlinearly constrained APPS in MethodAPPSDC
- String meritFunction
  the meritFunction choice for nonlinearly constrained APPS in MethodAPPSDC
- Real constrPenalty
  the constrPenalty choice for nonlinearly constrained APPS in MethodAPPSDC
- Real smoothFactor
  the initial smoothFactor value for nonlinearly constrained APPS in MethodAPPSDC
- Real constraintPenalty
  the initial constraint_penalty for COLINY methods in MethodAPPS, MethodSCOLIBDIR, MethodSCOLIBPS, MethodSCOLIBSW and MethodSCOLIBEA
- bool constantPenalty
  the constant_penalty flag for COLINY methods in MethodSCOLIBPS and MethodSCOLIBSW
- Real globalBalanceParam
  the global_balance_parameter for the DIRECT method in MethodSCOLIBDIR
- Real localBalanceParam
  the local_balance_parameter for the DIRECT method in MethodSCOLIBDIR
- Real maxBoxSize
  the max_boxsize_limit for the DIRECT method in MethodSCOLIBDIR
- Real \texttt{minBoxSize}
  
  the \texttt{min.boxsize_limit} for the \texttt{DIRECT} method in \texttt{MethodSCOLIBDIR} and \texttt{MethodNCSUDC}

- String \texttt{boxDivision}
  
  the \texttt{division} setting (\texttt{major_dimension} or all dimensions) for the \texttt{DIRECT} method in \texttt{MethodSCOLIBDIR}

- bool \texttt{mutationAdaptive}
  
  the \texttt{non_adaptive} specification for the \texttt{coliny_ea} method in \texttt{MethodSCOLIBEA}

- bool \texttt{showMiscOptions}
  
  the \texttt{show.misc_options} specification in \texttt{MethodSCOLIBDC}

- StringArray \texttt{miscOptions}
  
  the \texttt{misc.options} specification in \texttt{MethodSCOLIBDC}

- Real \texttt{solnTarget}
  
  the \texttt{solution.target} specification in \texttt{MethodSCOLIBDC}

- Real \texttt{crossoverRate}
  
  the \texttt{crossover_rate} specification for \texttt{EA} methods in \texttt{MethodSCOLIBEA}

- Real \texttt{mutationRate}
  
  the \texttt{mutation_rate} specification for \texttt{EA} methods in \texttt{MethodSCOLIBEA}

- Real \texttt{mutationScale}
  
  the \texttt{mutation.scale} specification for \texttt{EA} methods in \texttt{MethodSCOLIBEA}

- Real \texttt{mutationMinScale}
  
  the \texttt{min_scale} specification for mutation in \texttt{EA} methods in \texttt{MethodSCOLIBEA}

- Real \texttt{initDelta}
  
  the \texttt{initial.delta} specification for \texttt{APPS/COBYLA/PS/SW} methods in \texttt{MethodAPPS}, \texttt{MethodSCOLIBCOB}, \texttt{MethodSCOLIBPS}, and \texttt{MethodSCOLIBSW}

- Real \texttt{threshDelta}
  
  the \texttt{variable.tolerance} specification for \texttt{APPS/COBYLA/PS/SW} methods in \texttt{MethodAPPS}, \texttt{MethodSCOLIBCOB}, \texttt{MethodSCOLIBPS}, and \texttt{MethodSCOLIBSW}

- Real \texttt{contractFactor}
  
  the \texttt{contraction.factor} specification for \texttt{APPS/PS/SW} methods in \texttt{MethodAPPS}, \texttt{MethodSCOLIBPS}, and \texttt{MethodSCOLIBSW}

- int \texttt{newSolnsGenerated}
  
  the \texttt{new.solutions.generated} specification for \texttt{GA/EPSA} methods in \texttt{MethodSCOLIBEA}

- int \texttt{numberRetained}
  
  the integer assignment to random, \texttt{chc}, or elitist in the \texttt{replacement.type} specification for \texttt{GA/EPSA} methods in \texttt{MethodSCOLIBEA}

- bool \texttt{expansionFlag}
  
  the \texttt{no.expansion} specification for \texttt{APPS/PS/SW} methods in \texttt{MethodAPPS}, \texttt{MethodSCOLIBPS}, and \texttt{MethodSCOLIBSW}

- int \texttt{expandAfterSuccess}
  
  the \texttt{expand_after_success} specification for \texttt{PS/SW} methods in \texttt{MethodSCOLIBPS} and \texttt{MethodSCOLIBSW}

- int \texttt{contractAfterFail}
  
  the \texttt{contract_after_failure} specification for the \texttt{SW} method in \texttt{MethodSCOLIBSW}

- int \texttt{mutationRange}
  
  the \texttt{mutation_range} specification for the \texttt{pga.int} method in \texttt{MethodSCOLIBEA}
• int totalPatternSize
  the total_pattern_size specification for PS methods in MethodSCOLIBPS
• bool randomizeOrderFlag
  the stochastic specification for the PS method in MethodSCOLIBPS
• String selectionPressure
  the fitness_type specification for EA methods in MethodSCOLIBEA
• String replacementType
  the replacement_type specification for EA methods in MethodSCOLIBEA
• String crossoverType
  the crossover_type specification for EA methods in MethodSCOLIBEA
• String mutationType
  the mutation_type specification for EA methods in MethodSCOLIBEA
• String exploratoryMoves
  the exploratory_moves specification for the PS method in MethodSCOLIBPS
• String patternBasis
  the pattern_basis specification for APPS/PS methods in MethodAPPS and MethodSCOLIBPS
• String betaSolverName
  beta solvers don’t need documentation
• String evalSynchronize
  the synchronization setting for parallel pattern search methods in MethodSCOLIBPS and MethodAPPS
• size_t numCrossPoints
  The number of crossover points or multi-point schemes.
• size_t numParents
  The number of parents to use in a crossover operation.
• size_t numOffspring
  The number of children to produce in a crossover operation.
• String fitnessType
  the fitness assessment operator to use.
• String convergenceType
  The means by which this JEGA should converge.
• Real percentChange
  The minimum percent change before convergence for a fitness tracker converger.
• size_t numGenerations
  The number of generations over which a fitness tracker converger should track.
• Real fitnessLimit
  The cutoff value for survival in fitness limiting selectors (e.g., below_limit selector).
• Real shrinkagePercent
  The minimum percentage of the requested number of selections that must take place on each call to the selector (0, 1).
• String nichingType
  The niching type.
• RealVector nicheVector
  The discretization percentage along each objective.
• size_t numDesigns
  The maximum number of designs to keep when using the max_designs nicher.
• String postProcessorType
  The post processor type.
• RealVector distanceVector
  The discretization percentage along each objective.
• String initializationType
  The means by which the JEGA should initialize the population.
• String flatFile
  The filename to use for initialization.
• String logFile
  The filename to use for logging.
• int populationSize
  the population_size specification for GA methods in MethodSCOLIBEA
• bool printPopFlag
  The print_each_pop_flag to set the printing of the population at each generation.
• Real volBoxSize
  the volume_boxsize_limit for the DIRECT method in MethodNCSUDC
• int numSymbols
  the symbols specification for DACE methods
• bool mainEffectsFlag
  the main_effects specification for sampling methods in MethodDDACE)
• bool latinizeFlag
  the latinize specification for FSU QMC and CVT methods in MethodFSUDACE
• bool volQualityFlag
  the quality_metrics specification for sampling methods (FSU QMC and CVT methods in MethodFSUDACE)
• IntVector sequenceStart
  the sequenceStart specification in MethodFSUDACE
• IntVector sequenceLeap
  the sequenceLeap specification in MethodFSUDACE
• IntVector primeBase
  the primeBase specification in MethodFSUDACE
• int numTrials
  the numTrials specification in MethodFSUDACE
• String trialType
  the trial_type specification in MethodFSUDACE
• int randomSeed
  the seed specification for COLINY, NonD, & DACE methods
• Real initMeshSize
  the initMeshSize choice for NOMAD in MethodNOMADDC
• Real minMeshSize
  the minMeshSize choice for NOMAD in MethodNOMADDC
• String historyFile
the HISTORY_FILE specification for NOMAD

- String displayFormat
  the DISPLAY_STATS specification for NOMAD

- Real vns
  the VNS specification for NOMAD

- int neighborOrder
  the NEIGHBOR_ORDER specification for NOMAD

- bool showAllEval
  the DISPLAY_ALL_EVAL specification for NOMAD

- String useSurrogate
  the HAS_SGTE specification for NOMAD

- int numSamples
  the samples specification for NonD & DACE methods

- bool fixedSeedFlag
  flag for fixing the value of the seed among different NonD/DACE sample sets. This results in the use of the same sampling stencil/pattern throughout an execution with repeated sampling.

- bool fixedSequenceFlag
  flag for fixing the sequence for Halton or Hammersley QMC sample sets. This results in the use of the same sampling stencil/pattern throughout an execution with repeated sampling.

- bool vbdFlag
  the var_based_decomp specification for a variety of sampling methods

- Real vbdDropTolerance
  the var_based_decomp tolerance for omitting index output

- bool backfillFlag
  the backfill option allows one to augment in LHS sample by enforcing the addition of unique discrete variables to the sample

- bool pcaFlag
  Flag to specify the calculation of principal components when using LHS.

- Real percentVarianceExplained
  The percentage of variance explained by using a truncated number of principal components in PCA.

- bool wilksFlag
  Flag to specify use of Wilks formula to calculate num samples.

- unsigned short wilksOrder
  Wilks order parameter.

- Real wilksConfidenceLevel
  Wilks confidence interval parameter.

- short wilksSidedInterval
  Wilks sided interval type.

- unsigned short vbdOrder
  a sub-specification of vbdFlag: interaction order limit for calculation/output of component VBD indices

- short covarianceControl
  restrict the calculation of a full response covariance matrix for high dimensional outputs: {DEFAULT,DIAGONAL,FULL},COVARIANCE

- String rmgName
13.43. DATAMETHODOREP CLASS REFERENCE

- short refinementType
  refinement type for stochastic expansions from dimension refinement keyword group
- short refinementControl
  refinement control for stochastic expansions from dimension refinement keyword group
- short nestingOverride
  override for default point nesting policy: NO_NESTING_OVERRIDE, NESTED, or NON_NESTED
- short growthOverride
  override for default point growth restriction policy: NO_GROWTH_OVERRIDE, RESTRICTED, or UNRESTRICTED
- short expansionType
  enumeration for u-space type that defines u-space variable targets for probability space transformations: EXTENDED_U (default), ASKEY_U, STD_NORMAL_U, or STD_UNIFORM_U
- bool piecewiseBasis
  boolean indicating presence of piecewise keyword
- short expansionBasisType
  enumeration for type of basis in sparse grid interpolation (Pecos::<\{NODAL,HIERARCHICAL\} \INTERPOLANT) or regression (Pecos::<\{TENSOR\PRODUCT,TOTAL\ORDER,ADAPTED\} \BASIS).
- UShortArray quadratureOrderSeq
  the quadrature_order_sequence specification in MethodNonDPCE and MethodNonDSC
- UShortArray sparseGridLevelSeq
  the sparse_grid_level_sequence specification in MethodNonDPCE and MethodNonDSC
- UShortArray expansionOrderSeq
  the expansion_order_sequence specification in MethodNonDPCE
- SizetArray collocationPointsSeq
  the collocation_points_sequence specification in MethodNonDPCE
- SizetArray expansionSamplesSeq
  the expansion_samples_sequence specification in MethodNonDPCE
- unsigned short quadratureOrder
  the quadrature_order specification in MethodNonDPCE and MethodNonDSC
- unsigned short sparseGridLevel
  the sparse_grid_level specification in MethodNonDPCE and MethodNonDSC
- unsigned short expansionOrder
  the expansion_order specification in MethodNonDPCE
- size_t collocationPoints
  the collocation_points specification in MethodNonDPCE
- size_t expansionSamples
  the expansion_samples specification in MethodNonDPCE
- String expansionSampleType
  allows for incremental PCE construction using the incremental_lhs specification in MethodNonDPCE
- RealVector anisoDimPref
  the dimension_preference specification for tensor and sparse grids and expansion orders in MethodNonDPCE and MethodNonDSC
- unsigned short cubIntOrder

the basic random-number generator for NonD
CHAPTER 13. CLASS DOCUMENTATION

- Real \texttt{collocationRatio}
  
  \textit{the \texttt{collocationRatio} specification in MethodNonDPCE}

- Real \texttt{collocRatioTermsOrder}
  
  \textit{order applied to the number of expansion terms when applying or computing the collocation ratio within regression PCE; based on the \texttt{ratioOrder} specification in MethodNonDPCE}

- Short \texttt{regressionType}
  
  \textit{type of regression; LS, OMP, BP, BPDN, LARS, or LASSO}

- Short \texttt{lsRegressionType}
  
  \textit{type of least squares regression: SVD or EQ\_\text{CON\_QR}}

- RealVector \texttt{regressionNoiseTol}
  
  \textit{noise tolerance(s) for OMP, BPDN, LARS, and LASSO}

- Real \texttt{regressionL2Penalty}
  
  \textit{L2 regression penalty for a variant of LASSO known as the elastic net method (default of 0 gives standard LASSO)}

- Bool \texttt{crossValidation}
  
  \textit{flag indicating the use of cross-validation across expansion orders (given a prescribed maximum order) and, for some methods, noise tolerances}

- Bool \texttt{crossValidNoiseOnly}
  
  \textit{flag indicating the restriction of cross-validation to estimate only the most effective noise tolerance; used to reduce cost from performing CV over both noise tolerances and expansion orders}

- Unsigned short \texttt{adaptedBasisAdvancements}
  
  \textit{initial grid level for the ADAPTED BASIS_EXPANDING_FRONT approach to defining the candidate basis for sparse recovery (compressed sensing)}

- Bool \texttt{normalizedCoeffs}
  
  \textit{flag indicating the output of PCE coefficients corresponding to normalized basis polynomials}

- String \texttt{pointReuse}
  
  \textit{allows PCE construction to reuse points from previous sample sets or data import using the \texttt{reuse_points} specification in MethodNonDPCE}

- Bool \texttt{tensorGridFlag}
  
  \textit{flag for usage of a sub-sampled set of tensor-product grid points within regression PCE; based on the \texttt{tensor_grid} specification in MethodNonDPCE}

- UShortArray \texttt{tensorGridOrder}
  
  \textit{order of tensor-product grid points that are sub-sampled within orthogonal least interpolation PCE; based on the \texttt{tensor_grid} specification in MethodNonDPCE}

- Short \texttt{multilevDiscrepEmulation}
  
  \textit{type of discrepancy emulation in multilevel methods: distinct or recursive}

- String \texttt{importExpansionFile}
  
  \textit{the \texttt{import_expansion_file} specification in MethodNonDPCE}

- String \texttt{exportExpansionFile}
  
  \textit{the \texttt{export_expansion_file} specification in MethodNonDPCE}

- Unsigned short \texttt{sampleType}
  
  \textit{the \texttt{sample_type} specification in MethodNonDMC, MethodNonDPCE, and MethodNonDSC}

- Bool \texttt{dOptimal}
  
  \textit{whether to generate D-optimal designs}
• size_t numCandidateDesigns
  number of candidate designs in D-optimal design selection
• unsigned short reliabilitySearchType
  the type of limit state search in MethodNonDLocalRel
  (x\_taylor\_mean, x\_taylor\_mpp, x\_two\_point, u\_taylor\_mean, u\_taylor\_mpp, u\_two\_point, or no_approx)
  or MethodNonDGlobalRel (x\_gaussian\_process or u\_gaussian\_process)
• String reliabilityIntegration
  the first order or second order integration selection in MethodNonDLocalRel
• unsigned short integrationRefine
  the import, adapt_import, or mm\_adapt\_import integration refinement selection in MethodNonDLocalRel,
  MethodNonDPCE, and MethodNonDSC
• IntVector refineSamples
  Sequence of refinement samples, e.g., the size of the batch (e.g., number of supplemental points added) to be added
  to be added to the build points for an emulator at each iteration.
• SizetArray pilotSamples
  the pilot\_samples selection in MethodMultilevelMC
• short mlmfAllocControl
  the allocation\_control selection in MethodMultilevelPCE
• Real multilevelEstimatorRate
  the estimator\_rate selection in MethodMultilevelPCE
• short finalMomentsType
  the final\_moments specification in MethodNonD
• short distributionType
  the distribution cumulative or complementary specification in MethodNonD
• short responseLevelTarget
  the compute probabilities, reliabilities, or gen\_reliabilities specification in MethodNonD
• short responseLevelTargetReduce
  the system series or parallel specification in MethodNonD
• RealVectorArray responseLevels
  the response\_levels specification in MethodNonD
• RealVectorArray probabilityLevels
  the probability\_levels specification in MethodNonD
• RealVectorArray reliabilityLevels
  the reliability\_levels specification in MethodNonD
• RealVectorArray genReliabilityLevels
  the gen\_reliability\_levels specification in MethodNonD
• int chainSamples
  the number of MCMC chain samples
• int buildSamples
  the number of samples to construct an emulator, e.g., for Bayesian calibration methods
• int samplesOnEmulator
  number of samples to perform on emulator
• int emulatorOrder
  The total order to be used in construction of a VPS surrogate.
• short emulatorType
  the emulator specification in MethodNonDBayesCalib
• String mcmcType
  the mcmc type specification in MethodNonDBayesCalib
• bool standardizedSpace
  use of standardized probability spaces for MCMC within Bayesian inference
• bool adaptPosteriorRefine
  flag indicating adaptive refinement of the emulator in regions of high posterior probability
• bool logitTransform
  flag indicating user activation of logit transform option within QUESO
• bool gpmsaNormalize
  whether to apply GPMSA-internal normalization
• bool posteriorStatsKL
  flag indicating the calculation of KL divergence between prior and posterior in Bayesian methods
• bool posteriorStatsMutual
  flag indicating the calculation of mutual information between prior and posterior in Bayesian methods
• bool posteriorStatsKDE
  flag indicating calculation of kernel density estimate of posterior distributions
• bool chainDiagnostics
  flag indicating calculation of chain diagnostics
• bool chainDiagnosticsCI
  flag indicating calculation of confidence intervals as a chain diagnostics
• bool modelEvidence
  flag indicating calculation of the evidence of the model
• bool modelEvidMC
  flag indicating use of Monte Carlo approximation for evidence calc.
• int evidenceSamples
  number of prior samples to use in model evidence calculation
• bool modelEvidLaplace
  flag indicating use of Laplace approximation for evidence calc.
• unsigned short preSolveMethod
  the method used for performing a pre-solve for the MAP point
• String proposalCovType
  the type of proposal covariance: user, derivatives, or prior
• Real priorPropCovMult
  optional multiplier for prior-based proposal covariance
• int proposalCovUpdatePeriod
  number of samples after which to update the proposal covariance from misfit Hessian (using residual values and derivatives)
• String proposalCovInputType
  the format of proposal covariance input: diagonal or matrix
• RealVector proposalCovData
  raw list of real data for the proposal covariance
• **String** `proposalCovFile`
  file from which to read proposal covariance in diagonal or matrix format

• **String** `advancedOptionsFilename`
  file containing advanced ROL option overrides

• **String** `quesoOptionsFilename`
  file containing advanced QUESO option overrides

• **String** `fitnessMetricType`
  the fitness metric type specification in MethodNonDAAdaptive

• **String** `batchSelectionType`
  the batch selection type specification in MethodNonDAAdaptive

• **String** `lipschitzType`
  the Lipschitz type specification in MethodNonDPDOFDarts (e.g. either local or global estimation)

• **unsigned short** `calibrateErrorMode`
  calibration mode for observation error multipliers (CALIBRATE_*)

• **RealVector** `hyperPriorAlphas`
  hyperparameters inverse gamma prior alphas

• **RealVector** `hyperPriorBetas`
  hyperparameters inverse gamma prior alphas

• **int** `burnInSamples`
  number of MCMC samples to discard from acceptance chain

• **int** `subSamplingPeriod`
  period or skip in post-processing the acceptance chain

• **bool** `calModelDiscrepancy`
  flag to calculate model discrepancy

• **size_t** `numPredConfigs`
  number of prediction configurations at which to calculate model discrepancy

• **RealVector** `predictionConfigList`
  list of prediction configurations at which to calculate model discrepancy

• **String** `importPredConfigs`
  whether to import prediction configurations at which to calculate model discrepancy

• **unsigned short** `importPredConfigFormat`
  tabular format for prediction configurations import file

• **String** `modelDiscrepancyType`
  type of model discrepancy emulation

• **short** `approxCorrectionOrder`
  correction order for either gaussian process or polynomial model discrepancy calculations: 0 (constant), 1 (linear), 2 (quadratic)

• **String** `exportCorrModelFile`
  specify the name of file to which corrected model (model+discrepancy) calculations are output

• **unsigned short** `exportCorrModelFormat`
  tabular format for corrected model (model+discrepancy) export file

• **String** `exportCorrVarFile`
  specify the name of file to which corrected model variance calculations are output
- unsigned short exportCorrVarFormat
  tabular format for corrected model variance export file
- String exportDiscrepFile
  specify the name of file to which discrepancy calculations are output
- unsigned short exportDiscrepFormat
  tabular format for model discrepancy export file
- bool adaptExpDesign
  whether to perform adaptive Bayesian design of experiments
- String importCandPtsFile
  whether to import candidate design points for adaptive Bayesian experimental design
- unsigned short importCandFormat
  tabular format for the candidate design points import file
- size_t numCandidates
  number of candidate designs for adaptive Bayesian experimental design
- int maxHifiEvals
  maximum number of highfidelity model runs to be used for adaptive Bayesian experimental design
- int batchSize
  number of optimal designs selected per iteration of experimental design algorithm
- bool mutualInfoKSG2
  indicate that the KSG2 algorithm is to be employed in the calculation of the mutual information
- int numChains
  number of concurrent chains
- int numCR
  number of CR-factors
- int crossoverChainPairs
  number of crossover chain pairs
- Real grThreshold
  threshold for the Gelman-Rubin statistic
- int jumpStep
  how often to perform a long jump in generations
- int numPushforwardSamples
  Number of samples from the prior that is pushed forward through the model to obtain the initial set of pushforward samples.
- String dataDistType
  the type of data distribution: kde, or gaussian
- String dataDistCovInputType
  the format of data distribution gaussian covariance input: diagonal or matrix
- RealVector dataDistMeans
  raw list of real data for the data distribution gaussian means
- RealVector dataDistCovariance
  raw list of real data for the data distribution gaussian covariance
- String dataDistFile
  file from which to read data distribution data (covariance or samples)
• String `posteriorDensityExportFilename`
  The filename of the export file containing an arbitrary set of samples and their corresponding density values.

• String `posteriorSamplesExportFilename`
  The filename of the export file containing samples from the posterior and their corresponding density values.

• String `posteriorSamplesImportFilename`
  The filename of the import file containing samples at which the posterior will be evaluated.

• bool `generatePosteriorSamples`
  Flag specifying whether to generate random samples from the posterior.

• bool `evaluatePosteriorDensity`
  Flag specifying whether to evaluate the posterior density at a set of samples.

• RealVector `finalPoint`
  the `final_point` specification in MethodPSVPS

• RealVector `stepVector`
  the `step_vector` specification in MethodPSVPS and MethodPSCPS

• int `numSteps`
  the `num_steps` specification in MethodPSVPS

• IntVector `stepsPerVariable`
  the `deltas_per_variable` specification in MethodPSCPS

• RealVector `listOfPoints`
  the `list_of_points` specification in MethodPSLPS

• String `pstudyFilename`
  the `import_points_file` spec for a file-based parameter study

• unsigned short `pstudyFileFormat`
  tabular format for the parameter study points file

• bool `pstudyFileActive`
  whether to import active variables only

• UShortArray `varPartitions`
  the `partitions` specification for PStudy method in MethodPSMPS

• Real `refinementRate`
  rate of mesh refinement in Richardson extrapolation

• String `importBuildPtsFile`
  the file name from the `import_build_points_file` specification

• unsigned short `importBuildFormat`
  tabular format for the build point import file

• bool `importBuildActive`
  whether to import active variables only

• String `importApproxPtsFile`
  the file name from the `import_approx_points_file` specification

• unsigned short `importApproxFormat`
  tabular format for the approx point import file

• bool `importApproxActive`
  whether to import active variables only

• String `exportApproxPtsFile`
the file name from the `export_approx_points_file` specification

- `unsigned short exportApproxFormat`
  
  tabular format for the approx point export file

- `String exportMCMCPtsFile`
  
  the file name from the `export_mcmc_points_file` specification

- `bool exportSampleSeqFlag`
  
  flag for exporting the sequence of sample increments within multilevel sampling from the `export_sample_sequence` specification

- `unsigned short exportSamplesFormat`
  
  tabular format for the MCMC chain and MLMC sample sequence exports

Private Member Functions

- `DataMethodRep ()`
  
  constructor

- `~DataMethodRep ()`
  
  destructor

- `void write (std::ostream &s) const`
  
  write a DataInterfaceRep object to an std::ostream

- `void read (MPIUnpackBuffer &s)`
  
  read a DataInterfaceRep object from a packed MPI buffer

- `void write (MPIPackBuffer &s) const`
  
  write a DataInterfaceRep object to a packed MPI buffer

Private Attributes

- `int referenceCount`
  
  number of handle objects sharing this dataMethodRep

Friends

- `class DataMethod`
  
  the handle class can access attributes of the body class directly

13.43.1 Detailed Description

Body class for method specification data.

The DataMethodRep class is used to contain the data from a method keyword specification. Default values are managed in the DataMethodRep constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within ProblemDescDB since ProblemDescDB::dataMethodList is private.

The documentation for this class was generated from the following files:

- DataMethod.hpp
- DataMethod.cpp
13.44 DataModel Class Reference

Handle class for model specification data.

Public Member Functions

- DataModel ()
  constructor
- DataModel (const DataModel &)
  copy constructor
- ~DataModel ()
  destructor
- DataModel & operator= (const DataModel &)
  assignment operator
- void write (std::ostream &s) const
  write a DataModel object to an std::ostream
- void read (MPIUnpackBuffer &s)
  read a DataModel object from a packed MPI buffer
- void write (MPIPackBuffer &s) const
  write a DataModel object to a packed MPI buffer
- DataModelRep * data_rep ()
  return dataModelRep

Static Public Member Functions

- static bool id_compare (const DataModel &dm, const std::string &id)
  compares the idModel attribute of DataModel objects

Private Attributes

- DataModelRep * dataModelRep
  pointer to the body (handle-body idiom)

Friends

- class NIDRProblemDescDB

13.44.1 Detailed Description

Handle class for model specification data.

The DataModel class is used to provide a memory management handle for the data in DataModelRep. It is populated by IDRProblemDescDB::model_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of DataModel objects is maintained in ProblemDescDB::dataModelList, one for each model specification in an input file.

The documentation for this class was generated from the following files:

- DataModel.hpp
- DataModel.cpp
CHAPTER 13. CLASS DOCUMENTATION

13.45 DataModelRep Class Reference

Body class for model specification data.

Public Attributes

- `String idModel`
  
  string identifier for the model specification data set (from the `id_model` specification in `ModelIndControl`)

- `String modelType`
  
  model type selection: single, surrogate, or nested (from the model type specification in `ModelIndControl`)

- `String variablesPointer`
  
  string pointer to the variables specification to be used by this model (from the `variables_pointer` specification in `ModelIndControl`)

- `String interfacePointer`
  
  string pointer to the interface specification to be used by this model (from the `interface_pointer` specification in `ModelSingle` and the optional `interface_pointer` specification in `ModelNested`)

- `String responsesPointer`
  
  string pointer to the responses specification to be used by this model (from the `responses_pointer` specification in `ModelIndControl`)

- `bool hierarchicalTags`
  
  whether this model and its children will add hierarchy-based tags to eval ids

- `String subMethodPointer`
  
  pointer to a sub-iterator used for global approximations (from the `dace_method_pointer` specification in `ModelSurrG`) or by nested models (from the `sub_method_pointer` specification in `ModelNested`)

- `String solutionLevelControl`
  
  (state) variable identifier that defines a set or range of solution level controls (space/time discretization levels, iterative convergence tolerances, etc.) for defining a secondary hierarchy of fidelity within the scope of a single model form (from `solution_level_control` specification; see also `ordered_model_fidelities`)

- `RealVector solutionLevelCost`
  
  array of relative simulation costs corresponding to each of the solution levels (from `solution_level_cost` specification; see also `solution_level_control`); a scalar input is interpreted as a constant cost multiplier to be applied recursively

- `IntSet surrogateFnIndices`
  
  array specifying the response function set that is approximated

- `String surrogateType`
  
  the selected surrogate type: local_taylor, multipoint_tana, global_neural_network, mars, orthogonal_polynomial, gaussian, polynomial, kriging, or hierarchical

- `String actualModelPointer`
  
  pointer to the model specification for constructing the truth model used in constructing surrogates (from the `actual_model_pointer` specification in `ModelSurrL` and `ModelSurrMP`)

- `StringArray orderedModelPointers`
  
  an ordered list of model pointers (low to high) corresponding to a hierarchy of modeling fidelity (from the `ordered_model_fidelities` specification in `ModelSurrH`)

- `int pointsTotal`
  
  user-specified lower bound on total points with which to build the model (if `reuse_points < pointsTotal`, new samples will make up the difference)
• short pointsManagement
  points management configuration for DataFitSurrModel: DEFAULT_POINTS, MINIMUM_POINTS, or RECOMMENDED_POINTS
• String approxPointReuse
  sample reuse selection for building global approximations: none, all, region, or file (from the reuse_samples specification in ModelSurrG)
• String importBuildPtsFile
  the file name from the import_build_points_file specification in ModelSurrG
• unsigned short importBuildFormat
  tabular format for the build point import file
• bool importBuildActive
  whether to import active variables only
• String exportApproxPtsFile
  the file name from the export_approx_points_file specification in ModelSurrG
• unsigned short exportApproxFormat
  tabular format for the approx point export file
• bool exportSurrogate
  Option to turn on surrogate model export (export_model)
• String modelExportPrefix
  the filename prefix for export_model
• unsigned short modelExportFormat
  Format selection for export_model.
• short approxCorrectionType
  correction type for global and hierarchical approximations: NO_CORRECTION, ADDITIVE_CORRECTION, MULTIPLICATIVE_CORRECTION, or COMBINED_CORRECTION (from the correction specification in ModelSurrG and ModelSurrH)
• short approxCorrectionOrder
  correction order for global and hierarchical approximations: 0, 1, or 2 (from the correction specification in ModelSurrG and ModelSurrH)
• bool modelUseDerivsFlag
  flags the use of derivatives in building global approximations (from the use_derivatives specification in ModelSurrG)
• short polynomialOrder
  scalar integer indicating the order of the polynomial approximation (1=linear, 2=quadratic, 3=cubic; from the polynomial specification in ModelSurrG)
• RealVector krigingCorrelations
  vector of correlations used in building a kriging approximation (from the correlations specification in ModelSurrG)
• String krigingOptMethod
  optimization method to use in finding optimal correlation parameters: none, sampling, local, global
• short krigingMaxTrials
  maximum number of trials in optimization of kriging correlations
• RealVector krigingMaxCorrelations
  upper bound on kriging correlation vector
• RealVector krigingMinCorrelations
lower bound on kriging correlation vector

- **Real** krigingNugget
  - nugget value for kriging
- **short** krigingFindNugget
  - option to have Kriging find the best nugget value to use
- **short** mlsWeightFunction
  - weight function for moving least squares approximation
- **short** rbfBases
  - bases for radial basis function approximation
- **short** rbfMaxPts
  - maximum number of points for radial basis function approximation
- **short** rbfMaxSubsets
  - maximum number of subsets for radial basis function approximation
- **short** rbfMinPartition
  - minimum partition for radial basis function approximation
- **short** marsMaxBases
  - maximum number of bases for MARS approximation
- **String** marsInterpolation
  - interpolation type for MARS approximation
- **short** annRandomWeight
  - random weight for artificial neural network approximation
- **short** annNodes
  - number of nodes for artificial neural network approximation
- **Real** annRange
  - range for artificial neural network approximation
- **bool** domainDecomp
  - whether domain decomposition is enabled
- **String** decompCellType
  - type of local cell of domain decomposition
- **int** decompSupportLayers
  - number of support layers for each local basis function
- **bool** decompDiscontDetect
  - whether discontinuity detection is enabled
- **Real** discontJumpThresh
  - function value (jump) threshold for discontinuity detection in domain decomposition
- **Real** discontGradThresh
  - gradient threshold for discontinuity detection in domain decomposition
- **String** trendOrder
  - scalar integer indicating the order of the Gaussian process mean (0= constant, 1=linear, 2=quadratic, 3=cubic); from the Gaussian process specification in ModelSurrG)
- **bool** pointSelection
  - flag indicating the use of point selection in the Gaussian process
- **StringArray** diagMetrics
List of diagnostic metrics the user requests to assess the goodness of fit for a surrogate model.

- **bool crossValidateFlag**
  - flag indicating the use of cross validation on the metrics specified

- **int numFolds**
  - number of folds to perform in cross validation

- **Real percentFold**
  - percentage of data to withhold for cross validation process

- **bool pressFlag**
  - flag indicating the use of PRESS on the metrics specified

- **String importChallengePtsFile**
  - the file name from the challenge_points_file specification in ModelSurfG

- **unsigned short importChallengeFormat**
  - tabular format of the challenge data file

- **bool importChallengeActive**
  - whether to import active variables only

- **String optionalInterfRespPointer**
  - string pointer to the responses specification used by the optional interface in nested models (from the optional_interf_responses_pointer specification in ModelNested)

- **StringArray primaryVarMaps**
  - the primary variable mappings used in nested models for identifying the lower level variable targets for inserting top level variable values (from the primary_variable_mapping specification in ModelNested)

- **StringArray secondaryVarMaps**
  - the secondary variable mappings used in nested models for identifying the (distribution) parameter targets within the lower level variables for inserting top level variable values (from the secondary_variable_mapping specification in ModelNested)

- **RealVector primaryRespCoeffs**
  - the primary response mapping matrix used in nested models for weighting contributions from the sub-iterator responses in the top level (objective) functions (from the primary_response_mapping specification in ModelNested)

- **RealVector secondaryRespCoeffs**
  - the secondary response mapping matrix used in nested models for weighting contributions from the sub-iterator responses in the top level (constraint) functions (from the secondary_response_mapping specification in ModelNested)

- **bool identityRespMap**
  - whether an identity response map is requested in lieu of explicit maps

- **int subMethodServers**
  - number of servers for concurrent sub-iterator parallelism

- **int subMethodProcs**
  - number of processors for each concurrent sub-iterator partition

- **short subMethodScheduling**
  - scheduling approach for concurrent sub-iterator parallelism: {DEFAULT,MASTER,PEER}_SCHEDULING

- **int initialSamples**
  - initial samples to build the subspace model

- **unsigned short subspaceSampleType**
  - sampling method for building the subspace model
• IntVector refineSamples
  refinement samples to add in each batch
• int maxIterations
  maximum number of subspace build iterations
• Real convergenceTolerance
  convergence tolerance on build process
• bool subspaceIdBingLi
  Flag to use Bing Li method to identify active subspace dimension.
• bool subspaceIdConstantine
  Flag to use Constantine method to identify active subspace dimension.
• bool subspaceIdEnergy
  Flag to use eigenvalue energy method to identify active subspace dimension.
• bool subspaceBuildSurrogate
  Flag to build surrogate over active subspace.
• int subspaceDimension
  Size of subspace.
• unsigned short subspaceNormalization
  Normalization to use when forming a subspace with multiple response functions.
• int numReplicates
  Number of bootstrap samples for subspace identification.
• bool subspaceIdCV
  Flag to use cross validation to identify active subspace dimension.
• Real relTolerance
  relative tolerance used by cross validation subspace dimension id method
• Real decreaseTolerance
  decrease tolerance used by cross validation subspace dimension id method
• int subspaceCVMaxRank
  maximum rank considered by cross validation subspace dimension id method
• bool subspaceCVIncremental
  flag to use incremental dimension estimation in the cross validation metric
• unsigned short subspaceIdCVMethod
  Contains which cutoff method to use in the cross validation metric.
• bool autoRefine
  whether automatic surrogate refinement is enabled
• int maxFunctionEvals
  maximum evals in refinement
• String refineCVMetric
  metric to use in cross-validation guided refinement
• int softConvergenceLimit
  max number of iterations in refinement without improvement
• int refineCVFolds
  number of cross-validation folds in guided refinement
• unsigned short adaptedBasisSparseGridLev
sparse grid level for low-order PCE used to compute rotation matrix within adapted basis approach to dimension reduction

- unsigned short adaptedBasisExpOrder
  
  expansion order for low-order PCE used to compute rotation matrix within adapted basis approach to dimension reduction

- Real adaptedBasisCollocRatio
  
  collocation ratio for low-order PCE used to compute rotation matrix within adapted basis approach to dimension reduction

- unsigned short randomFieldIdForm
  
  Contains which type of random field model.

- unsigned short analyticCovIdForm
  
  Contains which type of analytic covariance function.

- Real truncationTolerance
  
  truncation tolerance on build process: percent variance explained

- String propagationModelPointer
  
  pointer to the model through which to propagate the random field

- String rfDataFileName
  
  File from which to build the random field.

Private Member Functions

- DataModelRep ()
  
  constructor

- ~DataModelRep ()
  
  destructor

- void write (std::ostream &s) const
  
  write a DataModelRep object to an std::ostream

- void read (MPIUnpackBuffer &s)
  
  read a DataModelRep object from a packed MPI buffer

- void write (MPIPackBuffer &s) const
  
  write a DataModelRep object to a packed MPI buffer

Private Attributes

- int referenceCount
  
  number of handle objects sharing this dataModelRep

Friends

- class DataModel
  
  the handle class can access attributes of the body class directly
13.45.1 Detailed Description

Body class for model specification data.

The DataModelRep class is used to contain the data from a model keyword specification. Default values are managed in the DataModelRep constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within ProblemDescDB since ProblemDescDB::dataModelList is private.

The documentation for this class was generated from the following files:

13.46.1 Detailed Description

Handle class for responses specification data.

The `DataResponses` class is used to provide a memory management handle for the data in `DataResponsesRep`. It is populated by IDRProblemDescDB::responses_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of `DataResponses` objects is maintained in ProblemDescDB::dataResponsesList, one for each responses specification in an input file.

The documentation for this class was generated from the following files:

- DataResponses.hpp
- DataResponses.cpp

13.47 DataResponsesRep Class Reference

Body class for responses specification data.

Public Attributes

- String idResponses
  
  string identifier for the responses specification data set (from the id_responses specification in RespSetId)

- StringArray responseLabels
  
  the response labels array (from the response_descriptors specification in RespLabels)

- size_t numObjectiveFunctions
  
  number of objective functions (from the num_objective_functions specification in RespFnOpt)

- size_t numLeastSqTerms
  
  number of least squares terms (from the num_calibration_terms specification in RespFnLS)

- size_t numNonlinearIneqConstraints
  
  number of nonlinear inequality constraints (from the num_nonlinear_inequality_constraints specification in RespFnOpt)

- size_t numNonlinearEqConstraints
  
  number of nonlinear equality constraints (from the num_nonlinear_equality_constraints specification in RespFnOpt)

- size_t numResponseFunctions
  
  number of generic response functions (from the num_response_functions specification in RespFnGen)

- size_t numScalarObjectiveFunctions
  
  scalar_objectives: number of objective functions which are scalar

- size_t numScalarLeastSqTerms
  
  scalar_calibration_terms: number of calibration terms which are scalar

- size_t numScalarNonlinearIneqConstraints
  
  number of scalar nonlinear inequality constraints (from the num_scalar_nonlinear_inequality_constraints specification in RespFnOpt)

- size_t numScalarNonlinearEqConstraints
  
  number of scalar nonlinear equality constraints (from the num_scalar_nonlinear_equality_constraints specification in RespFnOpt)

- size_t numScalarResponseFunctions
  
  scalar_responses: number of response functions which are scalar
• `size_t numFieldObjectiveFunctions`

  *field_objectives:* number of objective functions which are field-valued

• `size_t numFieldLeastSqTerms`

  *field_calibration_terms:* number of calibration terms which are field-valued

• `size_t numFieldNonlinearIneqConstraints`

  number of field nonlinear inequality constraints (from the `num_scalar_nonlinear_inequality_constraints` specification in RespFnOpt)

• `size_t numFieldNonlinearEqConstraints`

  number of field nonlinear equality constraints (from the `num_scalar_nonlinear_equality_constraints` specification in RespFnOpt)

• `size_t numFieldResponseFunctions`

  *field_responses:* number of response functions which are field-valued

• `StringArray primaryRespFnSense`

  optimization sense for each objective function: minimize or maximize

• `RealVector primaryRespFnWeights`

  vector of weightings for multiobjective optimization or weighted nonlinear least squares (from the `multi_objective_weights` specification in RespFnOpt and the `least_squares_weights` specification in RespFnLS)

• `RealVector nonlinearIneqLowerBnds`

  vector of nonlinear inequality constraint lower bounds (from the `nonlinear_inequality_lower_bounds` specification in RespFnOpt)

• `RealVector nonlinearIneqUpperBnds`

  vector of nonlinear inequality constraint upper bounds (from the `nonlinear_inequality_upper_bounds` specification in RespFnOpt)

• `RealVector nonlinearEqTargets`

  vector of nonlinear equality constraint targets (from the `nonlinear_equality_targets` specification in RespFnOpt)

• `StringArray primaryRespFnScaleTypes`

  vector of primary response function scaling types (from the `objective_function_scale_types` specification in RespFnOpt and the `least_squares.term_scale_types` specification in RespFnLS)

• `RealVector primaryRespFnScales`

  vector of primary response function scaling factors (from the `objective_function_scales` specification in RespFnOpt and the `least_squares.term_scales` specification in RespFnLS)

• `StringArray nonlinearIneqScaleTypes`

  vector of nonlinear inequality constraint scaling types (from the `nonlinear_inequality_scale_types` specification in RespFnOpt)

• `RealVector nonlinearIneqScales`

  vector of nonlinear inequality constraint scaling factors (from the `nonlinear_inequality_scales` specification in RespFnOpt)

• `StringArray nonlinearEqScaleTypes`

  vector of nonlinear equality constraint scaling types (from the `nonlinear_equality_scale_types` specification in RespFnOpt)

• `RealVector nonlinearEqScales`

  vector of nonlinear equality constraint scaling factors (from the `nonlinear_equality_scales` specification in RespFnOpt)

• `bool calibrationDataFlag`
whether calibration data was specified

• size_t numExperiments
  number of distinct experiments in experimental data

• size_t numExpConfigVars
  number of experimental configuration vars (state variables) in each row of data

• RealVector expConfigVars
  list of num_experiments x num_config_vars configuration variable values

• RealVector simVariance
  list of variances of errors to be added to simulation responses

• bool interpolateFlag
  whether one should interpolate between the experiment and simulation field data

• RealVector expObservations
  list of num_calibration_terms observation data

• RealVector expStdDeviations
  list of 1 or num_calibration_terms observation standard deviations

• String scalarDataFileName
  name of experimental data file containing response data (with optional state variable and sigma data) to read

• unsigned short scalarDataFormat
  tabular format of the scalar data file

• String gradientType
  gradient type: none, numerical, analytic, or mixed (from the no_gradients, numerical_gradients, analytic_gradients, and mixed_gradients specifications in RespGrad)

• String hessianType
  Hessian type: none, numerical, quasi, analytic, or mixed (from the no_hessians, numerical_hessians, quasi_hessians, analytic_hessians, and mixed_hessians specifications in RespHess)

• bool ignoreBounds
  option to ignore bounds when doing finite differences (default is to honor bounds)

• bool centralHess
  Temporary(?) option to use old 2nd-order diffs when computing finite-difference Hessians; default is forward differences.

• String quasiHessianType
  quasi-Hessian type: bfgs, damped_bfgs, or sr1 (from the bfgs and sr1 specifications in RespHess)

• String methodSource
  numerical gradient method source: dakota or vendor (from the method_source specification in RespGradNum and RespGradMixed)

• String intervalType
  numerical gradient interval type: forward or central (from the interval_type specification in RespGradNum and RespGradMixed)

• RealVector fdGradStepSize
  vector of finite difference step sizes for numerical gradients, one step size per active continuous variable, used in computing 1st-order forward or central differences (from the fd_gradient_step_size specification in RespGradNum and RespGradMixed)

• String fdGradStepType
  type of finite difference step to use for numerical gradient: relative - step length is relative to x absolute - step length is what is specified bounds - step length is relative to range of x
CHAPTER 13. CLASS DOCUMENTATION

- **RealVector fdHessStepSize**
  vector of finite difference step sizes for numerical Hessians, one step size per active continuous variable, used in computing 1st-order gradient-based differences and 2nd-order function-based differences (from the `fd_hessian_step_size` specification in `RespHessNum` and `RespHessMixed`)

- **String fdHessStepType**
  type of finite difference step to use for numerical Hessian: relative - step length is relative to x absolute - step length is what is specified bounds - step length is relative to range of x

- **IntSet idNumericalGrads**
  mixed gradient numerical identifiers (from the `id_numerical_gradients` specification in `RespGradMixed`)

- **IntSet idAnalyticGrads**
  mixed gradient analytic identifiers (from the `id_analytic_gradients` specification in `RespGradMixed`)

- **IntSet idNumericalHessians**
  mixed Hessian numerical identifiers (from the `id_numerical_hessians` specification in `RespHessMixed`)

- **IntSet idQuasiHessians**
  mixed Hessian quasi identifiers (from the `id_quasi_hessians` specification in `RespHessMixed`)

- **IntSet idAnalyticHessians**
  mixed Hessian analytic identifiers (from the `id_analytic_hessians` specification in `RespHessMixed`)

- **IntVector fieldLengths**
  number of entries in each field

- **IntVector numCoordsPerField**
  number of coordinates per field

- **bool readFieldCoords**
  Field data related storage: whether to read simulation field coordinates.

- **StringArray varianceType**
  Array which specifies the sigma type per response (none, one constant value, one per response (vector) or a full covariance matrix

**Private Member Functions**

- **DataResponsesRep ()**
  constructor

- **~DataResponsesRep ()**
  destructor

- **void write (std::ostream &s) const**
  write a `DataResponsesRep` object to an std::ostream

- **void read (MPIUnpackBuffer &s)**
  read a `DataResponsesRep` object from a packed MPI buffer

- **void write (MPIPackBuffer &s) const**
  write a `DataResponsesRep` object to a packed MPI buffer

**Private Attributes**

- **int referenceCount**
  number of handle objects sharing this `DataResponsesRep`
13.48. **DATATRANFORMMODEL CLASS REFERENCE**

**Friends**
- class `DataResponses`
  
  *the handle class can access attributes of the body class directly*

### 13.47.1 Detailed Description

Body class for responses specification data.

The `DataResponsesRep` class is used to contain the data from a responses keyword specification. Default values are managed in the `DataResponsesRep` constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within `ProblemDescDB` since `ProblemDescDB::dataResponsesList` is private.

The documentation for this class was generated from the following files:

- `DataResponses.hpp`
- `DataResponses.cpp`

### 13.48 DataTransformModel Class Reference

Data transformation specialization of `RecastModel`.

Inheritance diagram for DataTransformModel:

```
Model
  |
  v
RecastModel
  |
  v
DataTransformModel
```

**Public Member Functions**

- **DataTransformModel** (const `Model` &sub_model, const `ExperimentData` &exp_data, size_t num_hyper=0, unsigned short `mult_mode`=CALIBRATE_NONE, short `recastResp_deriv_order`=1)
  
  *standard constructor*

- **~DataTransformModel** ()
  
  *destructor*

- void `data_transform_response` (const `Variables` &sub_model_vars, const `Response` &sub_model_resp, `Response` &residual_resp)
  
  *Convenience function to help recover a residual response from the submodel.*

- void `data_resize` ()
  
  *The size of the ExperimentData changed; update the residualModel size.*

- void `print_best_responses` (std::ostream &s, const `Variables` &best_submodel_vars, const `Response` &best_submodel_resp, size_t num_best, size_t best_ind)
  
  *manage best responses including residuals and model responses per config*

- void `archive_best_responses` (const `ResultsManager` &results_db, const StrStrSizet iterator_id, const `Variables` &best_submodel_vars, const `Response` &best_submodel_resp, size_t num_best, size_t best_ind)
  
  *archive best responses*
• int num_config_vars () const
  return number of configuration variables

Protected Types

• typedef std::map<int, IntResponseMap> IntIntResponseMapMap

Protected Member Functions

• void gen_primary_resp_map (const SharedResponseData &srd, Sizet2DArray &primary.resp_map_indices, BoolDequeArray &nonlinear_resp_map) const
  compute the primary response map for a data transform RecastModel
• void derived_evaluate (const ActiveSet &set)
  specialization of evaluate that iterates over configuration variables
• void derived_evaluate_nowait (const ActiveSet &set)
  specialization of evaluate that iterates over configuration variables
• const IntResponseMap & derived_synchronize ()
  synchronize all evaluations (all residuals for all experiment configurations)
• const IntResponseMap & derived_synchronize_nowait ()
  return any evaluations for which all experiment configurations have completed
• const IntResponseMap & filter_submodel_responses ()
• void cache_submodel_responses (const IntResponseMap &sm.resp_map, bool deep_copy)
  cache the subModel responses into a per-RecastModel eval ID map
• void collect_residuals (bool collect_all)
  collect any (or force all) completed subModel evals and populate recastResponseMap with residuals for those that are fully completed
• void transform_response_map (const IntResponseMap &submodel_resp, const Variables &recast_vars, Response &residual_resp)
  transform a set of per-configuration subModel Responses to a single evaluation’s residuals
• void scale_response (const Variables &submodel_vars, const Variables &recast_vars, Response &recast_response)
  scale the populated residual response by any covariance information, including hyper-parameter multipliers
• void init_continuous_vars ()
  Initialize continuous variable values/labels.
• template<typename T>
  void expand_array (const SharedResponseData &srd, const T &submodel_array, size_t recast_size, T &recast_array) const
    (if non-empty) expand submodel_array by replicates to populate a recast_array
• template<typename T>
  void expand_scales_array (const SharedResponseData &srd, const T &submodel_array, size_t submodel_size, size_t recast_size, T &recast_array) const
    If size greater than 1, expand submodel_array by replicates to populate a pre-sized recast_array, otherwise copy.
• void print_residual_response (const Response &resid_resp)
• void recover_submodel_responses (std::ostream &s, const Variables &best_submodel_vars, size_t num_best, size_t best_ind, Response &residual_resp)
void archive_submodel_responses (const ResultsManager &results_db, const StrStrSizet &iterator_id, const Variables &best_submodel_vars, size_t num_best, size_t best_ind, Response &residualresp)
archive original model responses
void archive_best_original (const ResultsManager &results_db, const StrStrSizet &iterator_id, const RealVector &function_values, const int &exp_index, const int &num_best, const int &best_index)
Archive the best model responses (undifferenced with experimental data) for experiment exp_index and final solution soln_index.
void archive_best_config_variables (const ResultsManager &results_db, const StrStrSizet &iterator_id, const Variables &vars, const int &exp_index, const int &num_best, const int &best_index)
Archive the best configuration variables associated with each model response.
void archive_best_residuals (const ResultsManager &results_db, const StrStrSizet &iterator_id, const int num_fns, const RealVector &best_terms, const Real wssr, const int num_points, const int point_index)
Archive the best residuals.

Static Protected Member Functions

static SizetArray variables_expand (const Model &sub_model, size_t num_hyper)
expand the variable counts to account for hyper-parameters
static int get_hyperparam_vc_index (const Model &sub_model)
determine the index into vc_totals corresponding to where the hyper-parameters go
static short response_order (const Model &sub_model, short recast_resp_order=1)
helper to compute the recast response order during member initialization; recast_resp_order passed is the minimum request client needs
static void vars_mapping (const Variables &recast_vars, Variables &submodel_vars)
map the inbound expanded variables to the sub-model, discarding hyperparams (assumes hyper-parameters are at end of active continuous variables)
static void set_mapping (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &submodel_set)
map the inbound ActiveSet to the sub-model (map derivative variables)
static void primary_resp_differencer (const Variables &submodel_vars, const Variables &recast_vars, const Response &submodel_response, Response &recast_response)
Recast callback function to difference residuals with observed data.

Protected Attributes

const ExperimentData & expData
Reference to the experiment data used to construct this Model.
size_t numHyperparams
Number of calibrated variance multipliers.
unsigned short obsErrorMultiplierMode
Calibration mode for the hyper-parameters.
IntIntResponseMapMap cachedResp

Static Protected Attributes

static DataTransformModel * dtModelInstance
static pointer to this class for use in static callbacks

Additional Inherited Members

13.48.1 Detailed Description

Data transformation specialization of RecastModel.

Specialization of RecastModel to create a residual model that maps (1) from an augmented set of calibration parameters (including hyper-parameters) to those needed by the underlying simulation model and (2) from the simulation model response to a set of residuals, whose overall size may differ from the simulation (sub-model) response. The residuals may be scaled by experiment covariance information. This class provides a simple constructor that forwards to the more complicated RecastModel API.

13.48.2 Constructor & Destructor Documentation

DataTransformModel ( const Model & sub_model, const ExperimentData & exp_data, size_t num_hyper = 0, unsigned short mult_mode = CALIBRATE_NONE, short recast_resp_deriv_order = 1 )

standard constructor

This constructor computes various indices and mappings, then updates the properties of the RecastModel. Hyper-parameters are assumed to trail the active continuous variables when presented to this RecastModel.

References Dakota::abort_handler(), Model::current_response(), Model::cv(), Model::div(), Model::drv(), Model::dsv(), DataTransformModel::dtModelInstance, DataTransformModel::expand_array(), DataTransformModel::expand_scales_array(), DataTransformModel::expData, DataTransformModel::gen_primary_resp_map(), Model::icv(), Model::idiv(), Model::idrv(), Model::idsv(), Model::inactive_view(), DataTransformModel::init_continuous_vars(), RecastModel::init_maps(), Model::modelId, DataTransformModel::num_config_vars(), ExperimentData::num_config_vars(), Model::num_primary_fns(), Model::num_secondary_fns(), ExperimentData::num_total_exppoints(), DataTransformModel::numHyperparams, DataTransformModel::primary_response_differencer(), Model::primary_response_fn_sense(), Model::primary_response_fn_weights(), Model::primaryRespFnSense, Model::primaryRespFnWts, RecastModel::recast_model_id(), RecastModel::root_model_id(), Model::scaling_options(), Model::scalingOpts, DataTransformModel::set_mapping(), Response::shared_data(), RecastModel::subModel, and DataTransformModel::vars_mapping().

13.48.3 Member Function Documentation

Size_tArray variables_expand ( const Model & sub_model, size_t num_hyper ) [static], [protected]

expand the variable counts to account for hyper-parameters

Incorporate the hyper parameters into Variables, assuming they are at the end of the active continuous variables. For example, append them to continuous design or continuous aleatory uncertain.

References SharedVariablesData::components_totals(), Model::current_variables(), DataTransformModel::get_hyperparam_vc_index(), Variables::shared_data(), and Dakota::svd().

void derived_evaluate ( const ActiveSet & set ) [protected], [virtual]

specialization of evaluate that iterates over configuration variables

Blocking evaluation over all experiment configurations to compute a single set of expanded residuals. If the subModel supports asynchronous evaluate_nowait(), do the configuration evals concurrently and then synchronize.

Reimplemented from Model.

References Response::active_set(), Model::asynch_flag(), ExperimentData::config_vars(), Model::current_response(), Model::current_variables(), Model::currentResponse, Model::currentVariables, RecastModel::derived_evaluate(),
Model::evaluate(), Model::evaluate_nowait(), Model::evaluation_id(), DataTransformModel::expData, DataTransformModel::filter_submodel_responses(), ExperimentData::form_residuals(), Model::inactive_variables(), ExperimentData::num_experiments(), Model::outputLevel, RecastModel::recastIdMap, RecastModel::recastModelEvalCntr, DataTransformModel::scale_response(), RecastModel::subModel, DataTransformModel::transform_response_map(), RecastModel::transform_set(), and RecastModel::transform_variables().

```cpp
void derived_evaluate_nowait ( const ActiveSet & set ) [protected], [virtual]
```
specialization of evaluate that iterates over configuration variables

- Non-blocking evaluation (scheduling) over all experiment configurations. Assumes that if this model supports nowait, its subModel does too and schedules them all.
- Reimplemented from `Model`.
- References `ExperimentData::config_vars()`, `Variables::copy()`, `Model::current_variables()`, `Model::currentVariables`, `RecastModel::derived_evaluate_nowait()`, `Model::evaluate_nowait()`, `Model::evaluation_id()`, `DataTransformModel::expData`, `Model::inactive_variables()`, `ExperimentData::num_experiments()`, `Model::outputLevel`, `RecastModel::recastIdMap`, `RecastModel::recastModelEvalCntr`, `RecastModel::recastSetMap`, `RecastModel::recastVarsMap`, `RecastModel::subModel`, `RecastModel::transform_set()`, and `RecastModel::transform_variables()`.

```cpp
const IntResponseMap & derived_synchronize ( ) [protected], [virtual]
```
synchronize all evaluations (all residuals for all experiment configurations)

- Collect all the subModel evals and build the residual sets for all evaluations. Like rekey functions in DakotaModel, but many sub-model to one recast-model. For the blocking synchronize case, we force the subModel to synch and have all needed data.
- Reimplemented from `Model`.
- References `DataTransformModel::cache_submodel_responses()`, `DataTransformModel::collect_residuals()`, `ExperimentData::config_vars()`, `RecastModel::derived_synchronize()`, `DataTransformModel::expData`, `RecastModel::recursiveResponseMap`, `RecastModel::subModel`, and `Model::synchronize()`.

```cpp
const IntResponseMap & derived_synchronize_nowait ( ) [protected], [virtual]
```
return any evaluations for which all experiment configurations have completed

- Collect any completed subModel evals and build the residual sets for any fully completed evaluations. Like rekey functions in DakotaModel, but many sub-model to one recast-model. We do not force the subModel to synch.
- Reimplemented from `Model`.
- References `DataTransformModel::cache_submodel_responses()`, `DataTransformModel::collect_residuals()`, `ExperimentData::config_vars()`, `RecastModel::derived_synchronize_nowait()`, `DataTransformModel::expData`, `RecastModel::recursiveResponseMap`, `RecastModel::subModel`, and `Model::synchronize_nowait()`.

```cpp
const IntResponseMap & filter_submodel_responses ( ) [protected]
```
(We don’t quite want the rekey behavior since multiple subModel evals map to one recast eval.)

- References `Model::cache_unmatched_response()`, `RecastModel::recastIdMap`, `RecastModel::subModel`, and `Model::synchronize()`.
- Referenced by `DataTransformModel::derived_evaluate()`.
void transform_response_map ( const IntResponseMap & submodel_resp, const Variables & recast_vars, Response & residual_resp ) [protected]
transform a set of per-configuration subModel Responses to a single evaluation’s residuals
This transformation assumes the residuals are in submodel eval_id order.
References Dakota::abort_handler(), Model::current_variables(), DataTransformModel::expData, ExperimentData::form_residuals(), ExperimentData::num_experiments(), DataTransformModel::scale_response(), and RecastModel::subModel.
Referenced by DataTransformModel::collect_residuals(), and DataTransformModel::derived_evaluate().

void set_mapping ( const Variables & recast_vars, const ActiveSet & recast_set, ActiveSet & sub_model_set ) [static], [protected]
map the inbound ActiveSet to the sub-model (map derivative variables)
RecastModel sets up a default set mapping before calling this update, so focus on updating the derivative variables vector
References Model::cv(), ActiveSet::derivative_vector(), DataTransformModel::dtModelInstance, DataTransformModel::numHyperparams, ActiveSet::request_vector(), and RecastModel::subordinate_model().
Referenced by DataTransformModel::DataTransformModel().

void init_continuous_vars ( ) [protected]
Initialize continuous variable values/labels.
Pull up the continuous variable values and labels into the RecastModel, inserting the hyper-parameter values/labels
References Model::all_continuous_lower_bound(), Model::all_continuous_lower_bounds(), Model::all_continuous_upper_bound(), Model::all_continuous_upper_bounds(), Model::all_continuous_variable_label(), Model::all_continuous_variable_labels(), Model::all_continuous_variables(), SharedVariablesData::components_totals(), Model::current_variables(), DataTransformModel::expData, DataTransformModel::get_hyperparam_vc_index(), ExperimentData::hyperparam_labels(), DataTransformModel::numHyperparams, DataTransformModel::obsErrorMultiplierMode, Variables::shared_data(), RecastModel::subModel, and Dakota::svd().
Referenced by DataTransformModel::DataTransformModel().

void expand_scales_array ( const SharedResponseData & srd, const T & submodel_array, size_t submodel_size, size_t recast_size, T & recast_array ) const [protected]
If size greater than 1, expand submodel_array by replicates to populate a pre-sized recast_array, otherwise copy.
Passing the inbound array size so we can use one function for Teuchos and std containers (size vs. length)
References DataTransformModel::expand_array().
Referenced by DataTransformModel::DataTransformModel().

void archive_best_config_variables ( const ResultsManager & results_db, const StrStrSizet & iterator_id, const Variables & vars, const int & exp_index, const int & num_best, const int & best_index ) [protected]
Archive the best configuration variables associated with each model response.
Archive best configuration variables.
References ResultsManager::active(), Variables::inactive_continuous_variable_labels(), Variables::inactive_continuous_variables(), Variables::inactive_discrete_int_variable_labels(), Variables::inactive_discrete_int_variables(), Variables::inactive_discrete_real_variable_labels(), Variables::inactive_discrete_real_variables(), Variables::inactive_discrete_string_variable_labels(), Variables::inactive_discrete_string_variables(), and ResultsManager::insert().

  pointer to the body (handle-body idiom)

Friends
• class ProblemDescDB
• class NIDRProblemDescDB

13.49.1 Detailed Description
Handle class for variables specification data.

The DataVariables class is used to provide a memory management handle for the data in DataVariablesRep. It is populated by IDRProblemDescDB::variables_kwhandler() and is queried by the ProblemDescDB::get_<datatype>() functions. A list of DataVariables objects is maintained in ProblemDescDB::dataVariablesList, one for each variables specification in an input file.

The documentation for this class was generated from the following files:
• DataVariables.hpp
• DataVariables.cpp

13.50 DataVariablesRep Class Reference
Body class for variables specification data.

Public Attributes
• String idVariables
  string identifier for the variables specification data set (from the id_variables specification in VarSetId)
• short varsView
user selection/override of variables view: {DEFAULT, ALL, DESIGN, UNCERTAIN, ALEATORY, UNCERTAIN, EPISTEMIC, UNCERTAIN, STATE}_VIEW

- short varsdDomain

user selection/override of variables domain: {DEFAULT, MIXED, RELAXED}_DOMAIN

- bool uncertainVarsInitPt

flag indicating user specification of initial points (for local optimization-based UQ methods) for at least one uncertain variable type

- size_t numContinuousDesVars

  number of continuous design variables (from the continuous_design specification in VarDV)

- size_t numDiscreteDesRangeVars

  number of discrete design variables defined by an integer range (from the discrete_design_range specification in VarDV)

- size_t numDiscreteDesSetIntVars

  number of discrete design variables defined by a set of integers (from the discrete_design_set integer specification in VarDV)

- size_t numDiscreteDesSetStrVars

  number of discrete design variables defined by a set of strings (from the discrete_design_set string specification in VarDV)

- size_t numDiscreteDesSetRealVars

  number of discrete design variables defined by a set of reals (from the discrete_design_set real specification in VarDV)

- size_t numNormalUncVars

  number of normal uncertain variables (from the normal_uncertain specification in VarAUV)

- size_t numLognormalUncVars

  number of lognormal uncertain variables (from the lognormal_uncertain specification in VarAUV)

- size_t numUniformUncVars

  number of uniform uncertain variables (from the uniform_uncertain specification in VarAUV)

- size_t numLoguniformUncVars

  number of loguniform uncertain variables (from the loguniform_uncertain specification in VarAUV)

- size_t numTriangularUncVars

  number of triangular uncertain variables (from the triangular_uncertain specification in VarAUV)

- size_t numExponentialUncVars

  number of exponential uncertain variables (from the exponential_uncertain specification in VarAUV)

- size_t numBetaUncVars

  number of beta uncertain variables (from the beta_uncertain specification in VarAUV)

- size_t numGammaUncVars

  number of gamma uncertain variables (from the gamma_uncertain specification in VarAUV)

- size_t numGumbelUncVars

  number of gumbel uncertain variables (from the gumbel_uncertain specification in VarAUV)

- size_t numFrechetUncVars

  number of frechet uncertain variables (from the frechet_uncertain specification in VarAUV)

- size_t numWeibullUncVars

  number of weibull uncertain variables (from the weibull_uncertain specification in VarAUV)

- size_t numHistogramBinUncVars
• \texttt{size_t numPoissonUncVars}
  number of Poisson uncertain variables (from the \texttt{poisson_uncertain} specification in VarAUV)

• \texttt{size_t numBinomialUncVars}
  number of binomial uncertain variables (from the \texttt{binomial_uncertain} specification in VarAUV)

• \texttt{size_t numNegBinomialUncVars}
  number of negative binomial uncertain variables (from the \texttt{negative_binomial_uncertain} specification in VarAUV)

• \texttt{size_t numGeometricUncVars}
  number of geometric uncertain variables (from the \texttt{geometric_uncertain} specification in VarAUV)

• \texttt{size_t numHyperGeomUncVars}
  number of hypergeometric uncertain variables (from the \texttt{hypergeometric_uncertain} specification in VarAUV)

• \texttt{size_t numHistogramPtIntUncVars}
  number of integer-valued histogram point uncertain variables (from the \texttt{histogram_point_uncertain} specification in VarAUV)

• \texttt{size_t numHistogramPtStrUncVars}
  number of string-valued histogram point uncertain variables (from the \texttt{histogram_point_uncertain} specification in VarAUV)

• \texttt{size_t numHistogramPtRealUncVars}
  number of real-valued histogram point uncertain variables (from the \texttt{histogram_point_uncertain} specification in VarAUV)

• \texttt{size_t numContinuousIntervalUncVars}
  number of continuous epistemic interval uncertain variables (from the \texttt{continuous_interval_uncertain} specification in VarEUV)

• \texttt{size_t numDiscreteIntervalUncVars}
  number of discrete epistemic interval uncertain variables (from the \texttt{discrete_interval_uncertain} specification in VarEUV)

• \texttt{size_t numDiscreteUncSetIntVars}
  number of discrete epistemic uncertain integer set variables (from the \texttt{discrete_uncertain_set_integer} specification in VarEUV)

• \texttt{size_t numDiscreteUncSetStrVars}
  number of discrete epistemic uncertain string set variables (from the \texttt{discrete_uncertain_set_string} specification in VarEUV)

• \texttt{size_t numDiscreteUncSetRealVars}
  number of discrete epistemic uncertain real set variables (from the \texttt{discrete_uncertain_set_real} specification in VarEUV)

• \texttt{size_t numContinuousStateVars}
  number of continuous state variables (from the \texttt{continuous_state} specification in VarSV)

• \texttt{size_t numDiscreteStateRangeVars}
  number of discrete state variables defined by an integer range (from the \texttt{discrete_state_range} specification in VarDV)

• \texttt{size_t numDiscreteStateSetIntVars}
  number of discrete state variables defined by a set of integers (from the \texttt{discrete_state_set_integer} specification in VarDV)
13.50. DATAVARIABLESREP CLASS REFERENCE

- size_t numDiscreteStateSetStrVars
  number of discrete state variables defined by a set of strings (from the discrete_state_set string specification in VarDV)
- size_t numDiscreteStateSetRealVars
  number of discrete state variables defined by a set of reals (from the discrete_state_set real specification in VarDV)
- RealVector continuousDesignVars
  initial values for the continuous design variables array (from the continuous_design initial_point specification in VarDV)
- RealVector continuousDesignLowerBnds
  lower bounds array for the continuous design variables (from the continuous_design lower_bounds specification in VarDV)
- RealVector continuousDesignUpperBnds
  upper bounds array for the continuous design variables (from the continuous_design upper_bounds specification in VarDV)
- StringArray continuousDesignScaleTypes
  scale types array for the continuous design variables (from the continuous_design scale_types specification in VarDV)
- RealVector continuousDesignScales
  scales array for the continuous design variables (from the continuous_design scales specification in VarDV)
- IntVector discreteDesignRangeVars
  initial values for the discrete design variables defined by an integer range (from the discrete_design_range initial_point specification in VarDV)
- IntVector discreteDesignRangeLowerBnds
  lower bounds array for the discrete design variables defined by an integer range (from the discrete_design_range lower_bounds specification in VarDV)
- IntVector discreteDesignRangeUpperBnds
  upper bounds array for the discrete design variables defined by an integer range (from the discrete_design_range upper_bounds specification in VarDV)
- BitArray discreteDesignRangeCat
  is each ddr var strictly categorical (true) or relaxable (false)
- IntVector discreteDesignSetIntVars
  initial values for the discrete design variables defined by an integer set (from the discrete_design_set integer initial_point specification in VarDV)
- StringArray discreteDesignSetStrVars
  initial values for the discrete design variables defined by a string set (from the discrete_design_set string initial_point specification in VarDV)
- RealVector discreteDesignSetRealVars
  initial values for the discrete design variables defined by a real set (from the discrete_design_set real initial_point specification in VarDV)
- IntSetArray discreteDesignSetInt
  complete set of admissible values for each of the discrete design variables defined by an integer set (from the discrete_design_set integer set_values specification in VarDV)
- StringSetArray discreteDesignSetStr
complete set of admissible values for each of the discrete design variables defined by a string set (from the
discrete_design_set string set values specification in VarDV)

- RealSetArray discreteDesignSetString
  complete set of admissible values for each of the discrete design variables defined by a real set (from the discrete-
design_set real set values specification in VarDV)

- BitArray discreteDesignSetIntCat
  is each ddsi var strictly categorical (true) or relaxable (false)

- BitArray discreteDesignSetRealCat
  is each ddsr var strictly categorical (true) or relaxable (false)

- RealMatrixArray discreteDesignSetIntAdj
  Adjacency matrices for each of the discrete design variables defined by an integer set (from the discrete-
design_set integer categorical adjacency specification in VarDV)

- RealMatrixArray discreteDesignSetStrAdj
  Adjacency matrices for each of the discrete design variables defined by a string set (from the discrete_design-
set string adjacency specification in VarDV)

- RealMatrixArray discreteDesignSetRealAdj
  Adjacency matrices for each of the discrete design variables defined by a real set (from the discrete_design-
set real categorical adjacency specification in VarDV)

- StringArray continuousDesignLabels
  labels array for the continuous design variables (from the continuous_design descriptors specification
  in VarDV)

- StringArray discreteDesignRangeLabels
  labels array for the discrete design variables defined by an integer range (from the discrete_design_range
  descriptors specification in VarDV)

- StringArray discreteDesignSetIntLabels
  labels array for the discrete design variables defined by an integer set (from the discrete_design_set int
descriptors specification in VarDV)

- StringArray discreteDesignSetStrLabels
  labels array for the discrete design variables defined by a string set (from the discrete_design_set string
descriptors specification in VarDV)

- StringArray discreteDesignSetRealLabels
  labels array for the discrete design variables defined by a real set (from the discrete_design_set real;
descriptors specification in VarDV)

- RealVector normalUncMeans
  means of the normal uncertain variables (from the means specification in VarCAUV_Normal)

- RealVector normalUncStdDevs
  standard deviations of the normal uncertain variables (from the std deviations specification in VarCAUV_-Normal)

- RealVector normalUncLowerBnds
  distribution lower bounds for the normal uncertain variables (from the lower bounds specification in VarCAU-
V_Normal)

- RealVector normalUncUpperBnds
  distribution upper bounds for the normal uncertain variables (from the upper bounds specification in VarCAU-
V_Normal)

- RealVector normalUncVars
  initial values of the normal uncertain variables (from the initial_point specification in VarCAUV_Normal)
- RealVector lognormalUncLambdas
  * lambdas (means of the corresponding normals) of the lognormal uncertain variables (from the lambdas specification in VarCAUV_Lognormal)
- RealVector lognormalUncZetas
  * zetas (standard deviations of the corresponding normals) of the lognormal uncertain variables (from the zetas specification in VarCAUV_Lognormal)
- RealVector lognormalUncMeans
  * means of the lognormal uncertain variables (from the means specification in VarCAUV_Lognormal)
- RealVector lognormalUncStdDevs
  * standard deviations of the lognormal uncertain variables (from the std deviations specification in VarCAUV_Lognormal)
- RealVector lognormalUncErrFacts
  * error factors for the lognormal uncertain variables (from the error factors specification in VarCAUV_Lognormal)
- RealVector lognormalUncLowerBnds
  * distribution lower bounds for the lognormal uncertain variables (from the lower bounds specification in VarCAUV_Lognormal)
- RealVector lognormalUncUpperBnds
  * distribution upper bounds for the lognormal uncertain variables (from the upper bounds specification in VarCAUV_Lognormal)
- RealVector lognormalUncVars
  * initial values of the lognormal uncertain variables (from the initial point specification in VarCAUV_Lognormal)
- RealVector uniformUncLowerBnds
  * distribution lower bounds for the uniform uncertain variables (from the lower bounds specification in VarCAUV_Uniform)
- RealVector uniformUncUpperBnds
  * distribution upper bounds for the uniform uncertain variables (from the upper bounds specification in VarCAUV_Uniform)
- RealVector uniformUncVars
  * initial values of the uniform uncertain variables (from the initial point specification in VarCAUV_Uniform)
- RealVector loguniformUncLowerBnds
  * distribution lower bounds for the loguniform uncertain variables (from the lower bounds specification in VarCAUV_Loguniform)
- RealVector loguniformUncUpperBnds
  * distribution upper bounds for the loguniform uncertain variables (from the upper bounds specification in VarCAUV_Loguniform)
- RealVector loguniformUncVars
  * initial values of the loguniform uncertain variables (from the initial point specification in VarCAUV_Loguniform)
- RealVector triangularUncModes
  * modes of the triangular uncertain variables (from the modes specification in VarCAUV_Triangular)
- RealVector triangularUncLowerBnds
  * distribution lower bounds for the triangular uncertain variables (from the lower bounds specification in VarCAUV_Triangular)
- RealVector triangularUncUpperBnds
  * distribution upper bounds for the triangular uncertain variables (from the upper bounds specification in VarCAUV_Triangular)
• RealVector triangularUncVars
  initial values of the triangular uncertain variables (from the initial_point specification in VarCAUV_Triangular)

• RealVector exponentialUncBetas
  beta factors for the exponential uncertain variables (from the betas specification in VarCAUV_Exponential)

• RealVector exponentialUncVars
  initial values of the exponential uncertain variables (from the initial_point specification in VarCAUV_Exponential)

• RealVector betaUncAlphas
  alpha factors for the beta uncertain variables (from the means specification in VarCAUV_Beta)

• RealVector betaUncBetas
  beta factors for the beta uncertain variables (from the std.deviations specification in VarCAUV_Beta)

• RealVector betaUncLowerBnds
  distribution lower bounds for the beta uncertain variables (from the lower_bounds specification in VarCAUV_Beta)

• RealVector betaUncUpperBnds
  distribution upper bounds for the beta uncertain variables (from the upper_bounds specification in VarCAUV_Beta)

• RealVector betaUncVars
  initial values of the beta uncertain variables (from the initial_point specification in VarCAUV_Beta)

• RealVector gammaUncAlphas
  alpha factors for the gamma uncertain variables (from the alphas specification in VarCAUV_Gamma)

• RealVector gammaUncBetas
  beta factors for the gamma uncertain variables (from the betas specification in VarCAUV_Gamma)

• RealVector gammaUncVars
  initial values of the gamma uncertain variables (from the initial_point specification in VarCAUV_Gamma)

• RealVector gumbelUncAlphas
  alpha factors for the gumbel uncertain variables (from the alphas specification in VarCAUV_Gumbel)

• RealVector gumbelUncBetas
  beta factors for the gumbel uncertain variables (from the betas specification in VarCAUV_Gumbel)

• RealVector gumbelUncVars
  initial values of the gumbel uncertain variables (from the initial_point specification in VarCAUV_Gumbel)

• RealVector frechetUncAlphas
  alpha factors for the frechet uncertain variables (from the alphas specification in VarCAUV_Frechet)

• RealVector frechetUncBetas
  beta factors for the frechet uncertain variables (from the betas specification in VarCAUV_Frechet)

• RealVector frechetUncVars
  initial values of the frechet uncertain variables (from the initial_point specification in VarCAUV_Frechet)

• RealVector weibullUncAlphas
  alpha factors for the weibull uncertain variables (from the alphas specification in VarCAUV_Weibull)

• RealVector weibullUncBetas
  beta factors for the weibull uncertain variables (from the betas specification in VarCAUV_Weibull)

• RealVector weibullUncVars
  initial values of the weibull uncertain variables (from the initial_point specification in VarCAUV_Weibull)

• RealRealMapArray histogramUncBinPairs
An array for each real-valued bin-based histogram uncertain variable. Each array entry is a map from a real value to its probability. (See continuous linear histogram in LHS manual; from the histogram_bin_uncertain specification in VarCAUV_Bin_Histogram). (x,y) ordinate specifications are converted to (x,c) counts within NIDR.

- RealVector **histogramBinUncVars**
  - initial values of the histogram bin uncertain variables (from the initial_point specification in VarCAUV_Bin_Histogram)

- RealVector **poissonUncLambdas**
  - lambdas (rate parameter) for the poisson uncertain variables (from the lambdas specification in VarDAUV_Poisson)

- IntVector **poissonUncVars**
  - initial values of the poisson uncertain variables (from the initial_point specification in VarDAUV_Poisson)

- BitArray **poissonUncCat**
  - is each poisson var strictly categorical (true) or relaxable (false)

- RealVector **binomialUncProbPerTrial**
  - probabilities per each trial (p) for the binomial uncertain variables from the prob_per_trial specification in VarDAUV_Binomial

- IntVector **binomialUncNumTrials**
  - Number of trials (N) for the binomial uncertain variables from the num_trials specification in VarDAUV_Binomial

- IntVector **binomialUncVars**
  - initial values of the binomial uncertain variables (from the initial_point specification in VarDAUV_Binomial)

- BitArray **binomialUncCat**
  - is each binomial var strictly categorical (true) or relaxable (false)

- RealVector **negBinomialUncProbPerTrial**
  - probabilities per each trial (p) for the negative binomial uncertain variables from the prob_per_trial specification in VarDAUV_Negative_Binomial

- IntVector **negBinomialUncNumTrials**
  - Number of trials (N) for the negative binomial uncertain variables from the num_trials specification in VarDAUV_Negative_Binomial

- IntVector **negBinomialUncVars**
  - initial values of the negative binomial uncertain variables (from the initial_point specification in VarDAUV_Negative_Binomial)

- BitArray **negBinomialUncCat**
  - is each negbinomial var strictly categorical (true) or relaxable (false)

- RealVector **geometricUncProbPerTrial**
  - probabilities per each trial (p) for the geometric uncertain variables from the prob_per_trial specification in VarDAUV_Geometric

- IntVector **geometricUncVars**
  - initial values of the geometric uncertain variables (from the initial_point specification in VarDAUV_Geometric)

- BitArray **geometricUncCat**
  - is each geometric var strictly categorical (true) or relaxable (false)

- IntVector **hyperGeomUncTotalPop**
  - Size of total populations (N) for the hypergeometric uncertain variables from the total_population specification in VarDAUV_Hypergeometric

- IntVector **hyperGeomUncSelectedPop**
CHAPTER 13. CLASS DOCUMENTATION

Size of selected populations for the hypergeometric uncertain variables from the `selected_population` specification in `VarDAUV_Hypergeometric`

- `IntVector hyperGeomUncNumDrawn`
  Number failed in the selected populations for the hypergeometric variables from the `num_drawn` specification in `VarDAUV_Hypergeometric`

- `IntVector hyperGeomUncVars`
  initial values of the hypergeometric uncertain variables (from the `initial_point` specification in `VarDAUV_Hypergeometric`)

- `BitArray hyperGeomUncCat`
  is each hypergeom var strictly categorical (true) or relaxable (false)

- `IntRealMapArray histogramUncPointIntPairs`
  An array for each integer-valued point-based histogram uncertain variable. Each array entry is a map from an integer value to its probability. (See discrete histogram in LHS manual; from the `histogram_point` uncertain specification in `VarDAUV_Point_Histogram`)

- `IntVector histogramPointIntUncVars`
  initial values of the real-valued histogram point uncertain variables (from the `initial_point` specification in `VarDAUV_Point_Histogram`)

- `BitArray histogramUncPointIntCat`
  is each hupi var strictly categorical (true) or relaxable (false)

- `StringRealMapArray histogramUncPointStrPairs`
  An array for each string-valued point-based histogram uncertain variable. Each array entry is a map from a string value to its probability. (See discrete histogram in LHS manual; from the `histogram_point` uncertain specification in `VarDAUV_Point_Histogram`)

- `StringArray histogramPointStrUncVars`
  initial values of the real-valued histogram point uncertain variables (from the `initial_point` specification in `VarDAUV_Point_Histogram`)

- `RealRealMapArray histogramUncPointRealPairs`
  An array for each real-valued point-based histogram uncertain variable. Each array entry is a map from a real value to its probability. (See discrete histogram in LHS manual; from the `histogram_point` uncertain specification in `VarDAUV_Point_Histogram`)

- `RealVector histogramPointRealUncVars`
  initial values of the real-valued histogram point uncertain variables (from the `initial_point` specification in `VarDAUV_Point_Histogram`)

- `BitArray histogramUncPointRealCat`
  is each hupr var strictly categorical (true) or relaxable (false)

- `RealSymMatrix uncertainCorrelations`
  correlation matrix for all uncertain variables (from the `uncertain_correlation_matrix` specification in `VarCEUV_Correlations`). This matrix specifies rank correlations for LHS sampling and correlation coefficients ($\rho_{ij} = \text{normalized covariance matrix}$) for other methods.

- `RealRealPairRealMapArray continuousIntervalUncBasicProbs`
  Probability values per interval cell per epistemic interval uncertain variable (from the `continuous_interval_uncertain_interval_probs` specification in `VarCEUV_INTERVAL`)

- `RealVector continuousIntervalUncVars`
  initial values of the continuous interval uncertain variables (from the `initial_point` specification in `VarCEUV_INTERVAL`)

- `IntIntPairRealMapArray discreteIntervalUncBasicProbs`
Probability values per interval cell per epistemic interval uncertain variable (from the discrete.interval._uncertain interval.probs specification in VarDIUV)

- IntVector discreteIntervalUncVars
  initial values of the discrete interval uncertain variables (from the initial_point specification in VarDIUV)
- BitArray discreteIntervalUncCat
  is each diu var strictly categorical (true) or relaxable (false)
- IntRealMapArray discreteUncSetIntValuesProbs
  complete set of admissible values with associated basic probability assignments for each of the discrete epistemic uncertain variables defined by an integer set (from the discrete.uncertain_set integer set.values specification in VarDUSIV)
- IntVector discreteUncSetIntVars
  initial values of the discrete uncertain set integer variables (from the initial_point specification in VarDUSIV)
- BitArray discreteUncSetIntCat
  is each dusi var strictly categorical (true) or relaxable (false)
- StringRealMapArray discreteUncSetStrValuesProbs
  complete set of admissible values with associated basic probability assignments for each of the discrete epistemic uncertain variables defined by a string set (from the discrete.uncertain_set string set.values specification in VarDUSIV)
- StringArray discreteUncSetStrVars
  initial values of the discrete uncertain set integer variables (from the initial_point specification in VarDUSIV)
- RealRealMapArray discreteUncSetRealValuesProbs
  complete set of admissible values with associated basic probability assignments for each of the discrete epistemic uncertain variables defined by a real set (from the discrete.uncertain_set real set.values specification in VarDUSRV)
- RealVector discreteUncSetRealVars
  initial values of the discrete uncertain set real variables (from the initial_point specification in VarDUSRV)
- BitArray discreteUncSetRealCat
  is each dusr var strictly categorical (true) or relaxable (false)
- RealVector continuousStateVars
  initial values for the continuous state variables array (from the continuous.state initial_point specification in VarSV)
- RealVector continuousStateLowerBnds
  lower bounds array for the continuous state variables (from the continuous.state lower.bounds specification in VarSV)
- RealVector continuousStateUpperBnds
  upper bounds array for the continuous state variables (from the continuous.state upper.bounds specification in VarSV)
- IntVector discreteStateRangeVars
  initial values for the discrete state variables defined by an integer range (from the discrete.state.range initial_point specification in VarSV)
- IntVector discreteStateRangeLowerBnds
  lower bounds array for the discrete state variables defined by an integer range (from the discrete.state.range lower.bounds specification in VarSV)
- IntVector discreteStateRangeUpperBnds
  upper bounds array for the discrete state variables defined by an integer range (from the discrete.state.range upper.bounds specification in VarSV)
• BitArray discreteStateRangeCat
  is each dsr var strictly categorical (true) or relaxable (false)
• IntVector discreteStateSetIntVars
  initial values for the discrete state variables defined by an integer set (from the discrete_state_set integer initial_point specification in VarSV)
• StringArray discreteStateSetStrVars
  initial values for the discrete state variables defined by a string set (from the discrete_state_set string initial_point specification in VarSV)
• RealVector discreteStateSetRealVars
  initial values for the discrete state variables defined by a real set (from the discrete_state_set real initial_point specification in VarSV)
• IntSetArray discreteStateSetInt
  complete set of admissible values for each of the discrete state variables defined by an integer set (from the discrete_state_set integer set_values specification in VarSV)
• StringSetArray discreteStateSetStr
  complete set of admissible values for each of the discrete state variables defined by a string set (from the discrete_state_set string set_values specification in VarSV)
• RealSetArray discreteStateSetReal
  complete set of admissible values for each of the discrete state variables defined by a real set (from the discrete_state_set real set_values specification in VarSV)
• BitArray discreteStateSetIntCat
  is each dssi var strictly categorical (true) or relaxable (false)
• BitArray discreteStateSetRealCat
  is each dssr var strictly categorical (true) or relaxable (false)
• StringArray continuousStateLabels
  labels array for the continuous state variables (from the continuous_state descriptors specification in VarSV)
• StringArray discreteStateRangeLabels
  labels array for the discrete state variables defined by an integer range (from the discrete_state_range descriptors specification in VarSV)
• StringArray discreteStateSetIntLabels
  labels array for the discrete state variables defined by an integer set (from the discrete_state_set descriptors specification in VarSV)
• StringArray discreteStateSetStrLabels
  labels array for the discrete state variables defined by a string set (from the discrete_state_set descriptors specification in VarSV)
• StringArray discreteStateSetRealLabels
  labels array for the discrete state variables defined by a real set (from the discrete_state_set descriptors specification in VarSV)
• IntVector discreteDesignSetIntLowerBnds
  discrete design integer set lower bounds inferred from set values
• IntVector discreteDesignSetIntUpperBnds
  discrete design integer set upper bounds inferred from set values
• StringArray discreteDesignSetStrLowerBnds
  discrete design string set lower bounds inferred from set values
• **StringArray discreteDesignSetStrUpperBnds**
  discrete design string set upper bounds inferred from set values
• **RealVector discreteDesignSetRealLowerBnds**
  discrete design real set lower bounds inferred from set values
• **RealVector discreteDesignSetRealUpperBnds**
  discrete design real set upper bounds inferred from set values
• **RealVector continuousAleatoryUncVars**
  array of values for all continuous aleatory uncertain variables
• **RealVector continuousAleatoryUncLowerBnds**
  distribution lower bounds for all continuous aleatory uncertain variables (collected from nuv, lnuv, uuuv, luuv, tvuv, and buv specifications in VarAUV, and derived for gamma, gumbel, frechet, weibull and histogram bin specifications)
• **RealVector continuousAleatoryUncUpperBnds**
  distribution upper bounds for all continuous aleatory uncertain variables (collected from nuv, lnuv, uuuv, luuv, tvuv, and buv specifications in VarAUV, and derived for gamma, gumbel, frechet, weibull and histogram bin specifications)
• **StringArray continuousAleatoryUncLabels**
  labels for all continuous aleatory uncertain variables (collected from nuv, lnuv, uuuv, luuv, tvuv, buv, gauv, guuv, fuv, wuv, and buv descriptors in VarAUV)
• **IntVector discreteIntAleatoryUncVars**
  array of values for all discrete integer aleatory uncertain variables
• **IntVector discreteIntAleatoryUncLowerBnds**
  distribution lower bounds for all discrete integer aleatory uncertain variables
• **IntVector discreteIntAleatoryUncUpperBnds**
  distribution upper bounds for all discrete integer aleatory uncertain variables
• **StringArray discreteIntAleatoryUncLabels**
  labels for all discrete integer aleatory uncertain variables
• **StringArray discreteStrAleatoryUncVars**
  array of values for all discrete string epistemic uncertain variables
• **StringArray discreteStrAleatoryUncLowerBnds**
  distribution lower bounds for all discrete string epistemic uncertain variables
• **StringArray discreteStrAleatoryUncUpperBnds**
  distribution upper bounds for all discrete string epistemic uncertain variables
• **StringArray discreteStrAleatoryUncLabels**
  labels for all discrete string epistemic uncertain variables
• **RealVector discreteRealAleatoryUncVars**
  array of values for all discrete real aleatory uncertain variables
• **RealVector discreteRealAleatoryUncLowerBnds**
  distribution lower bounds for all discrete real aleatory uncertain variables
• **RealVector discreteRealAleatoryUncUpperBnds**
  distribution upper bounds for all discrete real aleatory uncertain variables
• **StringArray** `discreteRealAleatoryUncLabels`
  labels for all discrete real aleatory uncertain variables

• **RealVector** `continuousEpistemicUncVars`
  array of values for all continuous epistemic uncertain variables

• **RealVector** `continuousEpistemicUncLowerBnds`
  distribution lower bounds for all continuous epistemic uncertain variables

• **RealVector** `continuousEpistemicUncUpperBnds`
  distribution upper bounds for all continuous epistemic uncertain variables

• **StringArray** `continuousEpistemicUncLabels`
  labels for all continuous epistemic uncertain variables

• **IntVector** `discreteIntEpistemicUncVars`
  array of values for all discrete integer epistemic uncertain variables

• **IntVector** `discreteIntEpistemicUncLowerBnds`
  distribution lower bounds for all discrete integer epistemic uncertain variables

• **IntVector** `discreteIntEpistemicUncUpperBnds`
  distribution upper bounds for all discrete integer epistemic uncertain variables

• **StringArray** `discreteIntEpistemicUncLabels`
  labels for all discrete integer epistemic uncertain variables

• **StringArray** `discreteStrEpistemicUncVars`
  array of values for all discrete string epistemic uncertain variables

• **StringArray** `discreteStrEpistemicUncLowerBnds`
  distribution lower bounds for all discrete string epistemic uncertain variables

• **StringArray** `discreteStrEpistemicUncUpperBnds`
  distribution upper bounds for all discrete string epistemic uncertain variables

• **StringArray** `discreteStrEpistemicUncLabels`
  labels for all discrete string epistemic uncertain variables

• **RealVector** `discreteRealEpistemicUncVars`
  array of values for all discrete real epistemic uncertain variables

• **RealVector** `discreteRealEpistemicUncLowerBnds`
  distribution lower bounds for all discrete real epistemic uncertain variables

• **RealVector** `discreteRealEpistemicUncUpperBnds`
  distribution upper bounds for all discrete real epistemic uncertain variables

• **StringArray** `discreteRealEpistemicUncLabels`
  labels for all discrete real epistemic uncertain variables

• **IntVector** `discreteStateSetIntLowerBnds`
  discrete state integer set lower bounds inferred from set values

• **IntVector** `discreteStateSetIntUpperBnds`
  discrete state integer set upper bounds inferred from set values

• **StringArray** `discreteStateSetStrLowerBnds`
  discrete state string set lower bounds inferred from set values

• **StringArray** `discreteStateSetStrUpperBnds`
  discrete state string set upper bounds inferred from set values

• **RealVector** `discreteStateSetRealLowerBnds`
discrete state real set lower bounds inferred from set values

- RealVector `discreteStateSetRealUpperBnds`
  discrete state real set upper bounds inferred from set values

- RealVector `linearIneqConstraintCoeffs`
  coefficient matrix for the linear inequality constraints (from the `linear.inequality.constraint.matrix` specification in `MethodIndControl`)

- RealVector `linearIneqLowerBnds`
  lower bounds for the linear inequality constraints (from the `linear.inequality.lower.bounds` specification in `MethodIndControl`)

- RealVector `linearIneqUpperBnds`
  upper bounds for the linear inequality constraints (from the `linear.inequality.upper.bounds` specification in `MethodIndControl`)

- StringArray `linearIneqScaleTypes`
  scaling types for the linear inequality constraints (from the `linear.inequality.scale.types` specification in `MethodIndControl`)

- RealVector `linearIneqScales`
  scaling factors for the linear inequality constraints (from the `linear.inequality.scales` specification in `MethodIndControl`)

- RealVector `linearEqConstraintCoeffs`
  coefficient matrix for the linear equality constraints (from the `linear.equality.constraint.matrix` specification in `MethodIndControl`)

- RealVector `linearEqTargets`
  targets for the linear equality constraints (from the `linear.equality.targets` specification in `MethodIndControl`)

- StringArray `linearEqScaleTypes`
  scaling types for the linear equality constraints (from the `linear.equality.scale.types` specification in `MethodIndControl`)

- RealVector `linearEqScales`
  scaling factors for the linear equality constraints (from the `linear.equality.scales` specification in `MethodIndControl`)

**Private Member Functions**

- `DataVariablesRep ()`
  default constructor

- `~DataVariablesRep ()`
  destructor

- `void write (std::ostream &s) const`
  write a `DataVariablesRep` object to an `std::ostream`

- `void read (MPIUnpackBuffer &s)`
  read a `DataVariablesRep` object from a packed MPI buffer

- `void write (MPIPackBuffer &s) const`
  write a `DataVariablesRep` object to a packed MPI buffer
Private Attributes

- int referenceCount
  - number of handle objects sharing dataVarsRep

Friends

- class DataVariables
  - the handle class can access attributes of the body class directly

13.50.1 Detailed Description

Body class for variables specification data.

The DataVariablesRep class is used to contain the data from a variables keyword specification. Default values are managed in the DataVariablesRep constructor. Data is public to avoid maintaining set/get functions, but is still encapsulated within ProblemDescDB since ProblemDescDB::dataVariablesList is private.

The documentation for this class was generated from the following files:

- DataVariables.hpp
- DataVariables.cpp

13.51 DDACEDesignCompExp Class Reference

Wrapper class for the DDACE design of experiments library.

Inheritance diagram for DDACEDesignCompExp:

```
  Iterator
  |
  Analyzer
  |
  PStudyDACE
  |
  DDACEDesignCompExp
```

Public Member Functions

- DDACEDesignCompExp (ProblemDescDB &problem_db, Model &model)
  - primary constructor for building a standard DACE iterator
- DDACEDesignCompExp (Model &model, int samples, int symbols, int seed, unsigned short sampling_method)
  - alternate constructor used for building approximations
- ~DDACEDesignCompExp ()
  - destructor
- bool resize ()
  - reinitializes iterator based on new variable size
### Protected Member Functions

- **void** `pre_run()`  
  `pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori`
- **void** `core_run()`  
  `core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post`
- **void** `post_input()`  
  `read tabular data for post-run mode`
- **void** `post_run(std::ostream &s)`  
  `post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read Variables/Responses and perform final analysis phase in a standalone way`
- **int** `num_samples()` const
- **void** `sampling_reset(int min_samples, bool all_data_flag, bool stats_flag)`  
  `reset sampling iterator to use at least min_samples`
- **unsigned short** `sampling_scheme()` const  
  `return sampling name`
- **void** `vary_pattern(bool pattern_flag)`  
  `sets varyPattern in derived classes that support it`
- **void** `get_parameter_sets(Model &model)`  
  `Generate one block of numSamples samples (ndim * num_samples), populating allSamples; ParamStudy is the only class that specializes to use allVariables.`
- **void** `get_parameter_sets(Model &model, const int num_samples, RealMatrix &design_matrix)`  
  `Generate one block of numSamples samples (ndim * num_samples), populating design_matrix.`

### Private Member Functions

- **void** `compute_main_effects()`  
  `builds a DDaceMainEffects::OneWayANOVA if mainEffectsFlag is set`
- **boost::shared_ptr < DDaceSamplerBase >** `create_sampler(Model &model)`  
  `create a DDACE sampler`
- **void** `resolve_samples_symbols()`  
  `convenience function for resolving number of samples and number of symbols from input.`

### Private Attributes

- **unsigned short** `daceMethod`  
  `oas, lhs, oa_lhs, random, box_behnken, central_composite, or grid`
- **int** `samplesSpec`  
  `initial specification of number of samples`
- **int** `symbolsSpec`  
  `initial specification of number of symbols`
- **int** `numSamples`  
  `current number of samples to be evaluated`
• int numSymbols
  current number of symbols to be used in generating the sample set (inversely related to number of replications)
• const int seedSpec
  the user seed specification for the random number generator (allows repeatable results)
• int randomSeed
  current seed for the random number generator
• bool allDataFlag
  flag which triggers the update of allVars/allResponses for use by Iterator::allVariables() and Iterator::allResponses()
• size_t numDACERuns
  counter for number of executions for this object
• bool varyPattern
  flag for continuing the random number sequence from a previous execution (e.g., for surrogate-based optimization)
  so that multiple executions are repeatable but not correlated.
• bool mainEffectsFlag
  flag which specifies main effects
• std::vector< std::vector< int >> symbolMapping
  mapping of symbols for main effects calculations

Additional Inherited Members

13.5.1 Detailed Description

Wrapper class for the DDACE design of experiments library.

The DDACEDesignCompExp class provides a wrapper for DDACE, a C++ design of experiments library from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site. This class uses design and analysis of computer experiments (DACE) methods to sample the design space spanned by the bounds of a Model. It returns all generated samples and their corresponding responses as well as the best sample found.

13.5.2 Constructor & Destructor Documentation

DDACEDesignCompExp ( ProblemDescDB & problemDb,
  Model & model )

primary constructor for building a standard DACE iterator

This constructor is called for a standard iterator built with data from probDescDB.

References Dakota::abort_handler(), DDACEDesignCompExp::daceMethod, DDACEDesignCompExp::mainEffectsFlag, Iterator::maxEvalConcurrency, Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, and DDACEDesignCompExp::numSamples.

DDACEDesignCompExp ( Model & model, int samples, int symbols, int seed, unsigned short samplingMethod )

alternate constructor used for building approximations

This alternate constructor is used for instantiations on-the-fly, using only the incoming data. No problem description database queries are used.

References Dakota::abort_handler(), Iterator::maxEvalConcurrency, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, DDACEDesignCompExp::numSamples, and DDACEDesignCompExp::resolve_samples_symbols().
13.51.3 Member Function Documentation

```cpp
void pre_run( ) [protected], [virtual]
```

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally re-implement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented from Analyzer.

References DDACEDesignCompExp::get_parameter_sets(), Analyzer::get_vbd_parameter_sets(), Iterator::iteratedModel, DDACEDesignCompExp::numSamples, Analyzer::pre_run(), DDACEDesignCompExp::resolve_samples_symbols(), and PStudyDACE::varBasedDecompFlag.

```cpp
void core_run( ) [protected], [virtual]
```

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.

References DDACEDesignCompExp::allDataFlag, Analyzer::evaluate_parameter_sets(), Iterator::iteratedModel, DDACEDesignCompExp::mainEffectsFlag, Analyzer::numLSqTerms, Analyzer::numObjFns, and Iterator::subIteratorFlag.

```cpp
void post_run ( std::ostream & s ) [protected], [virtual]
```

post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally re-implement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically after performing its own implementation steps.

Reimplemented from Analyzer.

References Dakota::abort_handler(), Analyzer::allResponses, Analyzer::allSamples, SensAnalysisGlobal::compute_correlations(), DDACEDesignCompExp::compute_main_effects(), Analyzer::compute_vbd_stats(), DDACEDesignCompExp::create_sampler(), Iterator::iteratedModel, DDACEDesignCompExp::mainEffectsFlag, DDACEDesignCompExp::numSamples, Analyzer::post_run(), PStudyDACE::pStudyDACESensGlobal, DDACEDesignCompExp::seedSpec, Iterator::subIteratorFlag, DDACEDesignCompExp::symbolMapping, and PStudyDACE::varBasedDecompFlag.

```cpp
int num_samples( ) const [inline], [protected], [virtual]
```

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Analyzer.

References DDACEDesignCompExp::numSamples.

Referenced by DDACEDesignCompExp::get_parameter_sets().

```cpp
void resolve_samples_symbols( ) [private]
```

convenience function for resolving number of samples and number of symbols from input.
This function must define a combination of samples and symbols that is acceptable for a particular sampling algorithm. Users provide requests for these quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

References Dakota::abort_handler(), DDACEDesignCompExp::daceMethod, Analyzer::numContinuousVars, DDACEDesignCompExp::numSamples, DDACEDesignCompExp::numSymbols, and Iterator::submethod_enum_to_string().

Referenced by DDACEDesignCompExp::DDACEDesignCompExp(), DDACEDesignCompExp::post_input(), and DDACEDesignCompExp::pre_run().

The documentation for this class was generated from the following files:

- DDACEDesignCompExp.hpp
- DDACEDesignCompExp.cpp

### 13.52 DerivInformedPropCovLogitTK\(< V, M >\) Class Template Reference

*Dakota* transition kernel that updates proposal covariance based on derivatives (for logit random walk case)

Inherits TransformedScaledCovMatrixTKGroup\(< V, M >\).

#### Public Member Functions

- **DerivInformedPropCovLogitTK** (const char *prefix, const QUESO::VectorSet< V, M > &vectorSet, const std::vector<double> &scales, const M &covMatrix, NonDQUESOBayesCalibration *queso_instance)

  Constructor for derivative-informed logit proposal covariance.

- virtual ~DerivInformedPropCovLogitTK ()

  Destructor for derivative-informed logit proposal covariance.

- virtual void updateTK () override

- virtual bool covMatrixIsDirty () override

  whether the covariance matrix has been updated

- virtual void cleanCovMatrix () override

  dependent algorithms have taken necessary cleanup actions

#### Private Attributes

- const QUESO::VectorSet< V, M > & m_vectorSet

  calibration parameter vector set (note: hides base class member)

- bool covIsDirty

  whether we've updated the proposal covariance

- unsigned int chainIndex

  index into current chain position

- NonDQUESOBayesCalibration * nonDQUESOInstance

  *Dakota* QUESO instance for callbacks.
13.52.1 Detailed Description

```c++,template<class V, class M>class Dakota::DerivInformedPropCovLogitTK<V, M>```

**Dakota** transition kernel that updates proposal covariance based on derivatives (for logit random walk case)

The documentation for this class was generated from the following files:

- NonDQUESOBayesCalibration.hpp
- QUESOImpl.hpp
- QUESOImpl.cpp

13.53 DerivInformedPropCovTK<V, M> Class Template Reference

**Dakota** transition kernel that updates proposal covariance based on derivatives (for random walk case)

Inherits ScaledCovMatrixTKGroup<V, M>.

**Public Member Functions**

- **DerivInformedPropCovTK** (const char *prefix, const QUESO::VectorSpace<V, M> &vectorSpace, const std::vector<double> &scales, const M &covMatrix, NonDQUESOBayesCalibration *queso_instance)
  
  Constructor for derivative-informed proposal covariance.

- virtual ~DerivInformedPropCovTK()
  
  Destructor for derivative-informed proposal covariance.

- virtual void updateTK () override
  
  update the transition kernel with new covariance information

- virtual bool covMatrixIsDirty () override
  
  whether the covariance matrix has been updated

- virtual void cleanCovMatrix () override
  
  dependent algorithms have taken necessary cleanup actions

**Private Attributes**

- const QUESO::VectorSpace<V, M> & m_vectorSpace
  
  calibration parameter vector space (note: hides base class member)

- bool covIsDirty
  
  whether we’ve updated the proposal covariance

- unsigned int chainIndex
  
  index into current chain position

- NonDQUESOBayesCalibration * nonDQUESOInstance
  
  Dakota QUESO instance for callbacks.
13.53.1 Detailed Description

**template<class V, class M>class Dakota::DerivInformedPropCovTK< V, M >**

*Dakota* transition kernel that updates proposal covariance based on derivatives (for random walk case)

The documentation for this class was generated from the following files:

- NonDQUESOBayesCalibration.hpp
- QUESOImpl.hpp
- QUESOImpl.cpp

13.54 DirectApplicInterface Class Reference

Derived application interface class which spawns simulation codes and testers using direct procedure calls.

Inheritance diagram for DirectApplicInterface:

```
  Interface
    ApplicationInterface
      DirectApplicInterface
        MatlabInterface
        PythonInterface
        ScilabInterface
        TestDriverInterface
        ParallelDirectApplicInterface
        SerialDirectApplicInterface
```

**Public Member Functions**

- **DirectApplicInterface** (const ProblemDescDB &problem_db) 
  
  *constructor*

- **∼DirectApplicInterface** ()
  
  *destructor*

- void **derived_map** (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)
  
  *Called by map() and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.*

- void **derived_map_async** (const ParamResponsePair &pair)
  
  *Called by map() and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.*

- void **wait_local_evaluations** (PRPQueue &prp_queue)
  
  *For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.*

- void **test_local_evaluations** (PRPQueue &prp_queue)
  
  *For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.*

- int **synchronous_local_analysis** (int analysis_id)

- const StringArray & **analysis_drivers** () const
  
  *retrieve the analysis drivers specification for application interfaces*

- void **init_communicators_checks** (int max_eval_concurrency)

- void **set_communicators_checks** (int max_eval_concurrency)
Protected Member Functions

- `virtual int derived_map_if` (const Dakota::String &if_name)
  
  execute the input filter portion of a direct evaluation invocation

- `virtual int derived_map_ac` (const Dakota::String &ac_name)
  
  execute an analysis code portion of a direct evaluation invocation

- `virtual int derived_map_of` (const Dakota::String &of_name)
  
  execute the output filter portion of a direct evaluation invocation

- `virtual void set_local_data` (const Variables &vars, const ActiveSet &set)
  
  convenience function for local test simulators which sets per-evaluation variable and active set attributes; derived classes reimplementing this likely need to invoke the base class API

- `virtual void set_local_data` (const Response &response)
  
  convenience function for local test simulators which sets per-evaluation response attributes; derived classes reimplementing this likely need to invoke the base class API

- `virtual void set_local_data` (const Variables &vars, const ActiveSet &set, const Response &response)
  
  convenience function for local test simulators which sets per-evaluation variable, active set, and response attributes; derived classes reimplementing this likely need to invoke the base class API

- `void overlay_response` (Response &response)
  
  convenience function for local test simulators which overlays response contributions from multiple analyses using MPI_Reduce

Protected Attributes

- `String iFilterName`
  
  name of the direct function input filter

- `String oFilterName`
  
  name of the direct function output filter

- `driver_t iFilterType`
  
  enum type of the direct function input filter

- `driver_t oFilterType`
  
  enum type of the direct function output filter

- `bool gradFlag`
  
  signals use of fnGrads in direct simulator functions

- `bool hessFlag`
  
  signals use of fnHessians in direct simulator functions

- `size_t numFns`
  
  number of functions in fnVals

- `size_t numVars`
  
  total number of continuous and discrete variables

- `size_t numACV`
  
  total number of continuous variables

- `size_t numADIV`
  
  total number of discrete integer variables

- `size_t numADRV`
  
  total number of discrete real variables
• `size_t numADSV`
  total number of discrete string variables

• `size_t numDerivVars`
  number of active derivative variables

• `unsigned short localDataView`
  bit-wise record of which local data views are active; see enum `local DataView`

• `RealVector xC`
  continuous variables used within direct simulator fns

• `IntVector xDI`
  discrete int variables used within direct simulator fns

• `RealVector xDR`
  discrete real variables used within direct simulator fns

• `StringMultiArray xDS`
  discrete string variables used within direct simulator fns

• `StringMultiArray xCLabels`
  continuous variable labels

• `StringMultiArray xDILabels`
  discrete integer variable labels

• `StringMultiArray xDRLabels`
  discrete real variable labels

• `StringMultiArray xDSLabels`
  discrete string variable labels

• `std::map<std::string, var_t> varTypeMap`
  map from variable label to enum

• `std::map<std::string, driver_t> driverTypeMap`
  map from driver name to enum

• `std::map<var_t, Real> xCM`
  map from var_t enum to continuous value

• `std::map<var_t, int> xDIM`
  map from var_t enum to discrete int value

• `std::map<var_t, Real> xDRM`
  map from var_t enum to discrete real value

• `std::map<var_t, String> xDSM`
  map from var_t enum to discrete string value

• `std::vector<var_t> varTypeDVV`
  var_t enumerations corresponding to DVV components

• `std::vector<var_t> xCMLabels`
  var_t enumerations corresponding to continuous variable labels

• `std::vector<var_t> xDIMLabels`
  var_t enumerations corresponding to discrete integer variable labels

• `std::vector<var_t> xDRMLabels`
  var_t enumerations corresponding to discrete real variable labels

• `std::vector<var_t> xDSMLabels`
var enumerations corresponding to discrete string variable labels

- **ShortArray** `directFnASV`  
  class scope active set vector
- **SizetArray** `directFnDVS`  
  class scope derivative variables vector
- **RealVector** `fnVals`  
  response fn values within direct simulator fns
- **RealMatrix** `fnGrads`  
  response fn gradients w/i direct simulator fns
- **RealSymMatrixArray** `fnHessians`  
  response fn Hessians within direct fns
- **StringArray** `analysisDrivers`  
  the set of analyses within each function evaluation (from the analysis_drivers interface specification)

**Private Member Functions**

- void `map_labels_to_enum` (StringMultiArrayConstView &src, std::vector < var > &dest)  
  map labels in src to var in dest

**13.54.1 Detailed Description**

Derived application interface class which spawns simulation codes and testers using direct procedure calls. DirectApplicInterface uses a few linkable simulation codes and several internal member functions to perform parameter to response mappings.

**13.54.2 Member Function Documentation**

**int synchronous_local_analysis ( int analysis_id ) [inline], [virtual]**

This code provides the derived function used by ApplicationInterface::serve_analyses_synch(). Reimplemented from ApplicationInterface.

References DirectApplicInterface::analysisDriverIndex, DirectApplicInterface::analysisDrivers, and DirectApplicInterface::derived_map_ac().

**void init_communicators_checks ( int max_eval_concurrency ) [inline], [virtual]**

Process init issues as warnings since some contexts (e.g., HierarchSurrModel) initialize more configurations than will be used and DirectApplicInterface allows override by derived plug-ins.

Reimplemented from ApplicationInterface.

References ApplicationInterface::check_asyncynchronous(), and ApplicationInterface::check_multiprocessor_asyncynchronous().
void set_communicators_checks ( int max_eval_concurrency ) [inline], [virtual]

Process run-time issues as hard errors.
   Reimplemented from ApplicationInterface.
   Reimplemented in SerialDirectApplicInterface, and ParallelDirectApplicInterface.
   References Dakota::abort_handler(), ApplicationInterface::check_asynchronous(), and ApplicationInterface-::check_multiprocessor_asynchronous().

int derived_map_ac ( const Dakota::String & ac_name ) [protected], [virtual]

execute an analysis code portion of a direct evaluation invocation
   When a direct analysis/filter is a member function, the (vars,set,response) data does not need to be passed through the API. If, however, non-member analysis/filter functions are added, then pass (vars,set,response) through to the non-member fns:

   // API declaration
   int sim(const Variables& vars, const ActiveSet& set, Response& response);
   // use of API within derived_map_ac()
   if (ac_name == "sim")
      fail_code = sim(directFnVars, directFnActSet, directFnResponse);

   Reimplemented in SerialDirectApplicInterface, ParallelDirectApplicInterface, MatlabInterface, PythonInterface, TestDriverInterface, and ScilabInterface.
   References Dakota::abort_handler(), and ApplicationInterface::analysisServerId.
   Referenced by DirectApplicInterface::derived_map(), and DirectApplicInterface::synchronous_local_analysis().
   The documentation for this class was generated from the following files:
   • DirectApplicInterface.hpp
   • DirectApplicInterface.cpp

13.55 DiscrepancyCorrection Class Reference

Base class for discrepancy corrections.

Public Member Functions

• DiscrepancyCorrection ()
   default constructor
• DiscrepancyCorrection (Model &surr_model, const IntSet &surr_fn_indices, short corr_type, short corr_order)
   standard constructor
• DiscrepancyCorrection (const IntSet &surr_fn_indices, size_t num_fns, size_t num_vars, short corr_type, short corr_order)
   alternate constructor
• ~DiscrepancyCorrection ()
   destructor
• void initialize (Model &surr_model, const IntSet &surr_fn_indices, short corr_type, short corr_order)
   initialize the DiscrepancyCorrection data
• void initialize (const IntSet &surr_fn_indices, size_t num_fns, size_t num_vars, short corr_type, short corr_order)
initialize the DiscrepancyCorrection data

- void initialize (const IntSet &surr_fn_indices, size_t num_fns, size_t num_vars, short corr_type, short corr_order, const String &approx_type)

initialize the DiscrepancyCorrection data

- void compute (const Variables &vars, const Response &truth_response, const Response &approx_response, bool quiet_flag=false)
  compute the correction required to bring approx_response into agreement with truth_response and store in {add,mult}Corrections

- void compute (const Response &truth_response, const Response &approx_response, Response &discrepancy_response, bool quiet_flag=false)
  compute the correction required to bring approx_response into agreement with truth_response and store in discrepancy_response

- void compute (const VariablesArray &vars_array, const ResponseArray &truth_response_array, const ResponseArray &approx_response, bool quiet_flag=false)
  compute the correction required to bring approx_response into agreement with truth_response as a function of the variables and store in {add,mult}Corrections

- void apply (const Variables &vars, Response &approx_response, bool quiet_flag=false)
  apply the correction computed in compute() to approx_response

- void compute_variance (const VariablesArray &vars_array, RealMatrix &approx_variance, bool quiet_flag=false)
  compute the variance of approx_response

- void correction_type (short corr_type)
  update correctionType

- short correction_type () const
  return correctionType

- void correction_order (short order)
  update correctionOrder

- short correction_order () const
  return correctionOrder

- void data_order (short order)
  update dataOrder

- short data_order () const
  return dataOrder

- bool computed () const
  return correctionComputed

- bool initialized () const
  return initializedFlag

Protected Attributes

- IntSet surrogateFnIndices
  for mixed response sets, this array specifies the response function subset that is approximated

- bool initializedFlag
  indicates that discrepancy correction instance has been initialized following construction

- short correctionType
  approximation correction approach to be used: NO_CORRECTION, ADDITIVE_CORRECTION, MULTIPLICATIVE_CORRECTION, or COMBINED_CORRECTION.
• short correctionOrder
  approximation correction order to be used: 0, 1, or 2
• short dataOrder
  order of correction data in 3-bit format: overlay of 1 (value), 2 (gradient), and 4 (Hessian)
• bool correctionComputed
  flag indicating whether or not a correction has been computed and is available for application
• size_t numFns
  total number of response functions (of which surrogateFnIndices may define a subset)
• size_t numVars
  number of continuous variables active in the correction

Private Member Functions

• void initialize_corrections ()
  internal convenience function shared by overloaded initialize() variants
• bool check_multiplicative (const RealVector &truth_fns, const RealVector &approx_fns)
  define badScalingFlag
• void compute_additive (const Response &truth_response, const Response &approx_response, int index,
  Real &discrep_fn, RealVector &discrep_grad, RealSymMatrix &discrep_hess)
  internal convenience function for computing additive corrections between truth and approximate responses
• void compute_multiplicative (const Response &truth_response, const Response &approx_response, int index,
  Real &discrep_fn, RealVector &discrep_grad, RealSymMatrix &discrep_hess)
  internal convenience function for computing multiplicative corrections between truth and approximate responses
• void apply_additive (const Variables &vars, Response &approx_response)
  internal convenience function for applying additive corrections to an approximate response
• void apply_multiplicative (const Variables &vars, Response &approx_response)
  internal convenience function for applying multiplicative corrections to an approximate response
• void apply_additive (const Variables &vars, RealVector &approx_fns)
  internal convenience function for applying additive corrections to a set of response functions
• void apply_multiplicative (const Variables &vars, RealVector &approx_fns)
  internal convenience function for applying multiplicative corrections to a set of response functions
• const Response & search_db (const Variables &search_vars, const ShortArray &search_asv)
  search data pairs for missing approximation data

Private Attributes

• Pecos::DiscrepancyCalculator discrepCalc
  helper utility for calculating discrepancies
• bool badScalingFlag
  flag used to indicate function values near zero for multiplicative corrections; triggers an automatic switch to additive corrections
• bool computeAdditive
  flag indicating the need for additive correction calculations
• bool computeMultiplicative
flag indicating the need for multiplicative correction calculations

- **String approxType**
  string indicating the discrepancy approximation type

- **SharedApproxData sharedData**
  data that is shared among all correction Approximations

- **std::vector< Approximation > addCorrections**
  array of additive corrections; surrogate models of a model discrepancy function (formed from model differences)

- **std::vector< Approximation > multCorrections**
  array of multiplicative corrections; surrogate models of a model discrepancy function (formed from model ratios)

- **Model surrModel**
  shallow copy of the surrogate model instance as returned by Model::surrogate_model() (the DataFitSurrModel or HierarchSurrModel::lowFidelityModel instance)

- **RealVector combineFactors**
  factors for combining additive and multiplicative corrections. Each factor is the weighting applied to the additive correction and 1-factor is the weighting applied to the multiplicative correction. The factor value is determined by an additional requirement to match the high fidelity function value at the previous correction point (e.g., previous trust region center). This results in a multipoint correction instead of a strictly local correction.

- **Variables correctionPrevCenterPt**
  copy of center point from the previous correction cycle

- **RealVector truthFnsCenter**
  truth function values at the current correction point

- **RealVector approxFnsCenter**
  Surrogate function values at the current correction point.

- **RealMatrix approxGradsCenter**
  Surrogate gradient values at the current correction point.

- **RealVector truthFnsPrevCenter**
  copy of truth function values at center of previous correction cycle

- **RealVector approxFnsPrevCenter**
  copy of approximate function values at center of previous correction cycle

### 13.55.1 Detailed Description

Base class for discrepancy corrections.

The DiscrepancyCorrection class provides common functions for computing and applying corrections to approximations.

### 13.55.2 Member Function Documentation

void compute ( const Variables & vars, const Response & truth_response, const Response & approx_response, bool quiet_flag = false )

compute the correction required to bring approx_response into agreement with truth_response and store in {add,mult}Corrections

Compute an additive or multiplicative correction that corrects the approx_response to have 0th-order consistency (matches values), 1st-order consistency (matches values and gradients), or 2nd-order consistency (matches values, gradients, and Hessians) with the truth_response at a single point (e.g., the center of a trust region). The 0th-order, 1st-order, and 2nd-order corrections use scalar values, linear scaling functions, and quadratic scaling functions, respectively, for each response function.

### 13.56 DLSolverTraits Class Reference

A version of TraitsBase specialized for DLSolver.

Inheritance diagram for DLSolverTraits:

```
    TraitsBase
      └── DLSolverTraits
```

#### Public Member Functions

- **DLSolverTraits ()**
  
  *default constructor*

- **virtual ~DLSolverTraits ()**
  
  *destructor*

- **virtual bool is_derived ()**
  
  *A temporary query used in the refactor.*

- **bool supports_continuous_variables ()**
  
  *Return the flag indicating whether method supports continuous variables.*

- **bool supports_linear_equality ()**
  
  *Return the flag indicating whether method supports linear equalities.*

- **bool supports_linear_inequality ()**
  
  *Return the flag indicating whether method supports linear inequalities.*
13.57. DOTTRAITZ CLASS REFERENCE

- bool supports_nonlinear_equality ()
  Return the flag indicating whether method supports nonlinear equalities.
- bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear inequalities.
- NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format ()
  Return the format used for nonlinear inequality constraints.

13.56.1 Detailed Description

A version of TraitsBase specialized for DLSolver.

The documentation for this class was generated from the following file:
- DLSolver.hpp

13.57 DOTTraits Class Reference

Wrapper class for the DOT optimization library.

Inheritance diagram for DOTTraits:

```
TraitsBase

DOTTraits
```

Public Member Functions

- DOTTraits ()
  default constructor
- virtual ~DOTTraits ()
  destructor
- virtual bool is Derived ()
  A temporary query used in the refactor.
- bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.
- bool supports_linear_equality ()
  Return the flag indicating whether method supports linear equalities.
- bool supports_linear_inequality ()
  Return the flag indicating whether method supports linear inequalities.
- LINEAR_INEQUALITY_FORMAT linear_inequality_format ()
  Return the format used for linear inequality constraints.
- bool supports_nonlinear_equality ()
  Return the flag indicating whether method supports nonlinear equalities.
- bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear inequalities.
- NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format ()
  Return the format used for nonlinear inequality constraints.
13.57.1 Detailed Description

Wrapper class for the DOT optimization library.

The DOTOptimizer class provides a wrapper for DOT, a commercial Fortran 77 optimization library from Vanderplaats Research and Development. It uses a reverse communication mode, which avoids the static member function issues that arise with function pointer designs (see NPSOLOptimizer and SNLLOptimizer).

The user input mappings are as follows: max_iterations is mapped into DOT’s ITMAX parameter within its IPRM array, max_function_evaluations is implemented directly in the core_run() loop since there is no DOT parameter equivalent, convergence_tolerance is mapped into DOT’s DELOBJ parameter (the relative convergence tolerance) within its RPRM array, output verbosity is mapped into DOT’s IPRINT parameter within its function call parameter list (verbose: IPRINT = 7; quiet: IPRINT = 3), and optimization_type is mapped into DOT’s MINMAX parameter within its function call parameter list. Refer to [Vanderplaats Research and Development, 1995] for information on IPRM, RPRM, and the DOT function call parameter list. A version of TraitsBase specialized for DOT optimizers.

The documentation for this class was generated from the following file:

- DOTOptimizer.hpp

13.58 JEGAOptimizer::Driver Class Reference

A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm. Inherits Driver.

Public Member Functions

- GeneticAlgorithm * ExtractAllData (const AlgorithmConfig &algConfig)
  
  Reads all required data from the problem description database stored in the supplied algorithm config.
- DesignOFSortSet PerformIterations (GeneticAlgorithm *theGA)
  
  Performs the required iterations on the supplied GA.
- void DestroyAlgorithm (GeneticAlgorithm *theGA)
  
  Deletes the supplied GA.
- Driver (const ProblemConfig &probConfig)
  
  Default constructs a Driver.

13.58.1 Detailed Description

A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

This is necessary because DAKOTA requires that all problem information be extracted from the problem description DB at the time of Optimizer construction and the front end does it all in the execute algorithm method which must be called in core_run.

13.58.2 Constructor & Destructor Documentation

Driver ( const ProblemConfig & probConfig ) [inline]

Default constructs a Driver.
Parameters

| probConfig | The definition of the problem to be solved by this Driver whenever ExecuteAlgorithm is called. |

The problem can be solved in multiple ways by multiple algorithms even using multiple different evaluators by issuing multiple calls to ExecuteAlgorithm with different AlgorithmConfigs.

### 13.58.3 Member Function Documentation

**GeneticAlgorithm* ExtractAllData (const AlgorithmConfig & algConfig)** [inline]

Reads all required data from the problem description database stored in the supplied algorithm config.

The returned GA is fully configured and ready to be run. It must also be destroyed at some later time. You MUST call DestroyAlgorithm for this purpose. Failure to do so could result in a memory leak and an eventual segmentation fault! Be sure to call DestroyAlgorithm prior to destroying the algorithm config that was used to create it!

This is just here to expose the base class method to users.

**Parameters**

| algConfig | The fully loaded configuration object containing the database of parameters for the algorithm to be run on the known problem. |

**Returns**

The fully configured and loaded GA ready to be run using the PerformIterations method.

Referenced by JEGAOptimizer::core_run().

**DesignOFSortSet PerformIterations (GeneticAlgorithm *theGA)** [inline]

Performs the required iterations on the supplied GA.

This includes the calls to AlgorithmInitialize and AlgorithmFinalize and logs some information if appropriate.

This is just here to expose the base class method to users.

**Parameters**

| theGA | The GA on which to perform iterations. This parameter must be non-null. |

**Returns**

The final solutions reported by the supplied GA after all iterations and call to AlgorithmFinalize.

Referenced by JEGAOptimizer::core_run().

**void DestroyAlgorithm (GeneticAlgorithm *theGA)** [inline]

Deletes the supplied GA.

Use this method to destroy a GA after all iterations have been run. This method knows if the log associated with the GA was created here and needs to be destroyed as well or not.

This is just here to expose the base class method to users.

Be sure to use this prior to destroying the algorithm config object which contains the target. The GA destructor needs the target to be in tact.
Parameters

- **theGA**: The algorithm that is no longer needed and thus must be destroyed.

Referenced by JEGAOptimizer::core_run().

The documentation for this class was generated from the following file:

- JEGAOptimizer.cpp

### 13.59 EffGlobalMinimizer Class Reference

Inheritance diagram for EffGlobalMinimizer:

  - *initialize and update the penaltyParameter*
13.59. EFFGLOBALMINIMIZER CLASS REFERENCE

Static Private Member Functions

- static void{EIF.objective_eval} (const Variables &sub_model.vars, const Variables &recast.vars, const Response &sub_model.response, Response &recast_response)

  static function used as the objective function in the Expected Improvement (EIF) problem formulation for PMA

Private Attributes

- String setUpType
  controls iteration mode: "model" (normal usage) or "user.functions" (user-supplied functions mode for "on the fly" instantiations).
- Real distanceTol
  convergence tolerance on distance between predicted best points
- Model fHatModel
  GP model of response, one approximation per response function.
- Model eifModel
  recast model which assimilates mean and variance to solve the max(EIF) sub-problem
- Real meritFnStar
  minimum penalized response from among true function evaluations
- RealVector truthFnStar
  true function values corresponding to the minimum penalized response
- RealVector varStar
  point that corresponds to the optimal value meritFnStar
- short dataOrder
  order of the data used for surrogate construction, in ActiveSet request vector 3-bit format; user may override responses spec

Static Private Attributes

- static EffGlobalMinimizer * effGlobalInstance
  pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data

Additional Inherited Members

13.59.1 Detailed Description

The EffGlobalMinimizer class provides an implementation of the Efficient Global Optimization algorithm developed by Jones, Schonlau, & Welch as well as adaptation of the concept to nonlinear least squares.

13.59.2 Constructor & Destructor Documentation

~EffGlobalMinimizer ()
a alternate constructor for instantiations "on the fly"

destructor
13.59.3 Member Function Documentation

void core_run() [virtual]
core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.
References Dakota::abort_handler(), EffGlobalMinimizer::minimize_surrogates_on_model(), and EffGlobal-
Minimizer::setUpType.

const Model & algorithm_space_model() const [inline], [virtual]
default definition that gets redefined in selected derived Minimizers
Reimplemented from Minimizer.
References EffGlobalMinimizer::fHatModel.

void get_best_sample() [private]
called by minimize_surrogates for setUpType == "user_functions"
determine best solution from among sample data for expected improvement function
References Model::approximation_data(), SurrBasedMinimizer::augmented_lagrangian_merit(), Model::continuous-
variables(), Dakota::copy_data(), Model::current_response(), Model::evaluate(), EffGlobalMinimizer::fHatModel,
Response::function_values(), Iterator::iteratedModel, EffGlobalMinimizer::meritFnStar, Minimizer::numFunctions,
SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer-
::origNonlinIneqUpperBnds, Model::primary_response_fn_sense(), Model::primary_response_fn_weights(), Eff-
GlobalMinimizer::truthFnStar, and EffGlobalMinimizer::varStar.
Referenced by EffGlobalMinimizer::minimize_surrogates_on_model().

void EIF_objective_eval(const Variables & sub_model_vars, const Variables & recast_vars, const
Response & sub_model_response, Response & recast_response) [static], [private]
static function used as the objective function in the Expected Improvement (EIF) problem formulation for PMA
To maximize expected improvement, the approxSubProbMinimizer will minimize -(expected improvement).
References Response::active_set_request_vector(), Model::approximation_variances(), EffGlobalMinimizer::eff-
GlobalInstance, EffGlobalMinimizer::expected_improvement(), EffGlobalMinimizer::fHatModel, Response::function-
_value(), and Response::function_values().
Referenced by EffGlobalMinimizer::minimize_surrogates_on_model().
The documentation for this class was generated from the following files:

- EffGlobalMinimizer.cpp

13.60 EffGlobalTraits Class Reference

Implementation of Efficient Global Optimization/Least Squares algorithms.
Inheritance diagram for EffGlobalTraits:
13.61. EMBEDHYBRIDMETAITERATOR CLASS REFERENCE

Public Member Functions

- **EffGlobalTraits ()**
  *default constructor*

- **virtual ~EffGlobalTraits ()**
  *destructor*

- **virtual bool is_derived ()**
  *A temporary query used in the refactor.*

- **bool supports_continuous_variables ()**
  *Return the flag indicating whether method supports continuous variables.*

- **bool supports_nonlinear_equality ()**
  *Return the flag indicating whether method supports nonlinear equalities.*

- **bool supports_nonlinear_inequality ()**
  *Return the flag indicating whether method supports nonlinear inequalities.*

13.60.1 Detailed Description

Implementation of Efficient Global Optimization/Least Squares algorithms.
A version of TraitsBase specialized for efficient global minimizer
The documentation for this class was generated from the following file:

- EffGlobalMinimizer.hpp

13.61 EmbedHybridMetaIterator Class Reference

Meta-iterator for closely-coupled hybrid iteration, typically involving the embedding of local search methods within global search methods.

Inheritance diagram for EmbedHybridMetaIterator:

```
Iterator
  
MetaIterator
  
EmbedHybridMetaIterator
```
Public Member Functions

- `EmbedHybridMetaIterator (ProblemDescDB &problem_db)`
  standard constructor
- `EmbedHybridMetaIterator (ProblemDescDB &problem_db, Model &model)`
  alternate constructor
- `~EmbedHybridMetaIterator ()`
  destructor

Protected Member Functions

- `void core_run ()`
  Performs the hybrid iteration by executing global and local iterators, using a set of models that may vary in fidelity.
- `void derived_init_communicators (ParLevLIter pl_iter)`
  derived class contributions to initializing the communicators associated with this Iterator instance
- `void derived_set_communicators (ParLevLIter pl_iter)`
  derived class contributions to setting the communicators associated with this Iterator instance
- `void derived_free_communicators (ParLevLIter pl_iter)`
  derived class contributions to freeing the communicators associated with this Iterator instance
- `IntIntPair estimate_partition_bounds ()`
  estimate the minimum and maximum partition sizes that can be utilized by this Iterator
- `const Variables & variables_results () const`
  return the final solution from the embedded hybrid (variables)
- `const Response & response_results () const`
  return the final solution from the embedded hybrid (response)

Private Attributes

- `Iterator globalIterator`
  the top-level outer iterator (e.g., global minimizer)
- `Model globalModel`
  the model employed by the top-level outer iterator
- `Iterator localIterator`
  the inner iterator (e.g., local minimizer)
- `Model localModel`
  the model employed by the inner iterator
- `bool singlePassedModel`
  use of constructor that enforces use of a single passed Model
- `Real localSearchProb`
  the probability of running a local search refinement within phases of the global minimization for tightly-coupled hybrids
Additional Inherited Members

13.61.1 Detailed Description

Meta-iterator for closely-coupled hybrid iteration, typically involving the embedding of local search methods within global search methods.

This meta-iterator uses multiple methods in close coordination, generally using a local search minimizer repeatedly within a global minimizer (the local search minimizer refines candidate minima which are fed back to the global minimizer).

The documentation for this class was generated from the following files:

- EmbedHybridMetaIterator.hpp
- EmbedHybridMetaIterator.cpp

13.62 Environment Class Reference

Base class for the environment class hierarchy.

Inheritance diagram for Environment:

```
Environment
|-- ExecutableEnvironment
|-- LibraryEnvironment
```

Public Member Functions

- **Environment ()**
  
  default constructor: empty envelope

- **Environment (int argc, char *argv[])**
  
  envelope constructor for ExecutableEnvironment letter

- **Environment (ProgramOptions prog_opts)**

- **Environment (MPI_Comm dakota_mpi_comm, ProgramOptions prog_opts=ProgramOptions())**

- **Environment (const String &env_type)**
  
  envelope constructor for letter type identified by String

- **Environment (const Environment &env)**
  
  copy constructor

- virtual **~Environment ()**
  
  destructor

- **Environment operator= (const Environment &env)**
  
  assignment operator

- virtual void **execute ()**
  
  the run function for the environment: invoke the iterator(s) on the model(s). Called from main.cpp.

- **bool check () const**

  Print status of check and return true if in a "check" mode, including version and help. Return false if proceeding to a run mode.
• MPIManager & mpi_manager ()
  return mpiManager
• ProgramOptions & program_options ()
  return programOptions
• OutputManager & output_manager ()
  return outputManager
• ParallelLibrary & parallel_library ()
  return parallelLib
• ProblemDescDB & problem_description_db ()
  return probDescDB
• const Variables & variables_results () const
  return the final environment solution (variables)
• const Response & response_results () const
  return the final environment solution (response)
• void exit_mode (const String &mode="exit")
  allow environment clients to set Dakota exit behavior (throw vs. exit)

Protected Member Functions

• Environment (BaseConstructor)
  constructor initializes the base class part of default-constructed letters
• Environment (BaseConstructor, int argc, char *argv[])
  constructor initializes the base class part of executable letter classes
• Environment (BaseConstructor, ProgramOptions prog_opts, MPI_Comm dakota_mpi_comm=MPI_COMM_WORLD)
  constructor initializes the base class part of library letter classes
• void parse (bool check_bcast_database=true, DbCallbackFunctionPtr callback=NULL, void *callback_data=NULL)
  parse inputs, callbacks, and optionally check and broadcast
• void construct ()
  Instantiate topLevelIterator.
• void destruct ()
  Deallocate parallel partitioning for topLevelIterator.
• bool assign_model_pointer () const

Protected Attributes

• MPIManager mpiManager
  the MPI manager instance
• ProgramOptions programOptions
  the command line options manager
• OutputManager outputManager
  (tagged) output stream manager
• ParallelLibrary parallelLib
the parallel library instance
- ProblemDescDB probDescDB
  the parser database instance
- Iterator topLevelIterator
  the top level (meta-)iterator
- UsageTracker usageTracker
  tool for Dakota usage tracking (this is a thin wrapper class)

Private Member Functions
- Environment * get_environment (const String &env_type)
  Used by the envelope to instantiate the correct letter class.

Private Attributes
- Environment * environmentRep
  pointer to the letter (initialized only for the envelope)
- int referenceCount
  number of objects sharing environmentRep

13.62.1 Detailed Description
Base class for the environment class hierarchy.

The Environment class is the base class for the class hierarchy providing the top level control in DAKOTA. The environment is responsible for creating and managing iterators and models. For memory efficiency and enhanced polymorphism, the environment hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Environment) serves as the envelope and one of the derived classes (selected in Environment::get_environment()) serves as the letter.

13.62.2 Constructor & Destructor Documentation

Environment ()
default constructor: empty envelope

Environment ( int argc, char * argv[] )
envelope constructor for ExecutableEnvironment letter

Environment ( ProgramOptions prog_opts )
Envelope constructor for LibraryEnvironment. Selection of derived type by get_environment() is not necessary in this case.

References Dakota::abort_handler(), and Environment::environmentRep.
CHAPTER 13. CLASS DOCUMENTATION

Environment ( MPI_Comm dakota_mpi_comm, ProgramOptions prog_opts = ProgramOptions () )

Envelope constructor for LibraryEnvironment. Selection of derived type by get_environment() is not necessary in this case.
References Dakota::abort_handler(), and Environment::environmentRep.

Environment ( const String & env_type )

Envelope constructor for letter type identified by String
Alternate construction by String. Envelope constructor invokes get_environment() which instantiates a derived class letter; the derived constructor selects a BaseConstructor constructor in its initialization list to avoid the recursion of a base class constructor calling get_environment() again.
References Dakota::abort_handler(), Environment::environmentRep, and Environment::get_environment().

Environment ( const Environment & env )

Copy constructor
Copy constructor manages sharing of environmentRep and incrementing of referenceCount.
References Environment::environmentRep, and Environment::referenceCount.

∼Environment ( ) [virtual]

Destructor decrements referenceCount and only deletes environmentRep when referenceCount reaches zero.
References Environment::destruct(), Environment::environmentRep, and Environment::referenceCount.

Environment ( BaseConstructor ) [protected]

Constructor initializes the base class part of default-constructed letters
This letter constructor initializes base class data for inherited environments that are default constructed. Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ∼Environment).
Use cases: library with no options, no MPI comm
References ProgramOptions::exit_mode(), Environment::exit_mode(), WorkdirHelper::initialize(), and Environment::programOptions.

Environment ( BaseConstructor, int argc, char * argv[] ) [protected]

Constructor initializes the base class part of executable letter classes
This letter constructor initializes base class data for inherited environments: instantiate/initialize the environment, options, parallel library, and problem description database objects. Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ∼Environment).
Use cases: executable with command-line args
References ProgramOptions::exit_mode(), Environment::exit_mode(), WorkdirHelper::initialize(), and Environment::programOptions.

Environment ( BaseConstructor, ProgramOptions prog_opts, MPI_Comm dakota_mpi_comm = MPI_COMM_WORLD ) [protected]

Constructor initializes the base class part of library letter classes
This letter constructor initializes base class data for inherited environments. Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Environment).

Use cases: library with program options library with program options and MPI comm

References ProgramOptions::exit_mode(), Environment::exit_mode(), WorkdirHelper::initialize(), and Environment-::programOptions.

13.62.3 Member Function Documentation

**Environment operator= ( const Environment & env )**

Assignment operator

References Environment::environmentRep, and Environment::referenceCount.

**void exit_mode ( const String & mode = "exit" )**

allow environment clients to set Dakota exit behavior (throw vs. exit)

Set the global variable controlling Dakota’s exit behavior. Call with no arguments to reset to default behavior.

References Dakota::abort_handler(), and Dakota::abort_mode.

Referenced by Environment::Environment(), and run_dakota_data().

**void parse ( bool check_bcast_database = true, DbCallbackFunctionPtr callback = NULL, void * callback_data = NULL ) [protected]**

parse inputs, callbacks, and optionally check and broadcast

Parse input file and invoked any callbacks, then optionally check and sync database if check_bcast_database = true

References ProblemDescDB::check_and_broadcast(), ProgramOptions::input_file(), ProgramOptions::input_string(), ProblemDescDB::parse_inputs(), Environment::probDescDB, and Environment::programOptions.

Referenced by ExecutableEnvironment::ExecutableEnvironment(), and LibraryEnvironment::LibraryEnvironment().

**Environment * get_environment ( const String & env_type ) [private]**

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize environmentRep to the appropriate derived type, as given by the environmentName attribute.

Referenced by Environment::Environment().

The documentation for this class was generated from the following files:

- DakotaEnvironment.hpp
- DakotaEnvironment.cpp

13.63 NomadOptimizer::Evaluator Class Reference

NOMAD-based Evaluator class.

Inherits Evaluator.
Public Member Functions

- **Evaluator** (const NOMAD::Parameters &p, Model &model)
  - Constructor.
- **~Evaluator** (void)
  - Destructor.
- bool **eval** (NOMAD::EvalPoint &x, const NOMAD::Double &h_max, bool &count_eval) const
  - Main Evaluation Method.
- void **set_constraint_map** (int numNomadNonlinearIneqConstraints, int numNomadNonlinearEqConstraints,
  std::vector<int> constraintMapIndices, std::vector<double> constraintMapMultipliers, std::vector<double> constraintMapOffsets)
  - publishes constraint transformation
- void **set_surrogate_usage** (std::string useSurrogate)
  - publishes surrogate usage

Private Attributes

- Model & _model
- int _n_cont
- int _n_disc_int
- int _n_disc_real
- int numNomadNonlinearIneqConstr
  - Number of nonlinear constraints after put into Nomad format.
- int numNomadNonlinearEqConstr
  - std::vector<int> constrMapIndices
  - map from Dakota constraint number to Nomad constraint number
- std::vector<double> constrMapMultipliers
  - multipliers for constraint transformations
- std::vector<double> constrMapOffsets
  - offsets for constraint transformations
- std::string useSgte
  - defines use of surrogate in NOMAD

13.63.1 Detailed Description

NOMAD-based **Evaluator** class.

The NOMAD process requires an evaluation step, which calls the Simulation program. In the simplest version of this call, NOMAD executes the black box executable, which proceeds to write a file in a NOMAD-compatible format, which NOMAD reads to continue the process.

Because DAKOTA files are different form NOMAD files, and the simulations processed by DAKOTA already produce DAKOTA-compatible files, we cannot use this method for NOMAD. Instead, we implement the Nomad-Evaluator class, which takes the NOMAD inputs and passes them to DAKOTA's Interface for processing. The evaluator then passes the evaluation Responses into the NOMAD objects for further analysis.
13.63.2 Constructor & Destructor Documentation

Evaluator ( const NOMAD::Parameters & p, Model & model )

Constructor.
   NOMAD Evaluator Constructor
### 13.63.3 Member Function Documentation

```cpp
bool eval_x ( NOMAD::Eval_Point & x, const NOMAD::Double & h_max, bool & count_eval ) const
```

Main Evaluation Method.

Method that handles the communication between the NOMAD search process and the Black Box Evaluation managed by DAKOTA's [Interface](#).

**Parameters**

| x | Object that contains the points that need to evaluated. Once the evaluation is completed, this object also stores the output back to be read by NOMAD. |
| h_max | Current value of the barrier parameter. Not used in this implementation. |
| count_eval | Flag that indicates whether this evaluation counts towards the max number of evaluations, often set to false when the evaluation does not meet certain costs during expensive evaluations. Not used in this implementation. |

**Returns**

`true` if the evaluation was successful; `false` otherwise.

**References** Dakota::set_index_to_value().

The documentation for this class was generated from the following files:

- NomadOptimizer.hpp
- NomadOptimizer.cpp

### 13.64 JEGAOptimizer::Evaluator Class Reference

An evaluator specialization that knows how to interact with Dakota. Inherits GeneticAlgorithmEvaluator.

**Public Member Functions**

- virtual bool Evaluate (DesignGroup &group) 
  
  *Does evaluation of each design in group.*

- virtual bool Evaluate (Design &des) 
  
  *This method cannot be used!!*

- virtual std::string GetName () const 
  
  *Returns the proper name of this operator.*

- virtual std::string GetDescription () const 
  
  *Returns a full description of what this operator does and how.*

- virtual GeneticAlgorithmOperator * Clone (GeneticAlgorithm &algorithm) const 
  
  *Creates and returns a pointer to an exact duplicate of this operator.*

- Evaluator (GeneticAlgorithm &algorithm, Model &model)
13.64. **JEGAOPTIMIZER::EVALUATOR CLASS REFERENCE**

Constructs a *Evaluator* for use by *algorithm*.

- **Evaluator** (const *Evaluator* &copy)
  
  *Evaluator* constructs a *Evaluator*.

- **Evaluator** (const *Evaluator* &copy, *GeneticAlgorithm* &algorithm, *Model* &model)
  
  *Evaluator* constructs a *Evaluator* for use by *algorithm*.

### Static Public Member Functions

- static const std::string & **Name** ()

  *Returns the proper name of this operator.*

- static const std::string & **Description** ()

  *Returns a full description of what this operator does and how.*

### Protected Member Functions

- void **SeparateVariables** (const *Design* &from, *RealVector* &intoCont, *IntVector* &intoDiscInt, *RealVector* &intoDiscReal, *StringMultiArray* &intoDiscString) const

  *This method fills intoCont, intoDiscInt and intoDiscReal appropriately using the values of from.*

- void **RecordResponses** (const *RealVector* &from, *Design* &into) const

  *Records the computed objective and constraint function values into into.*

- std::size_t **GetNumberNonLinearConstraints** () const

  *Returns the number of non-linear constraints for the problem.*

- std::size_t **GetNumberLinearConstraints** () const

  *Returns the number of linear constraints for the problem.*

### Private Member Functions

- **Evaluator** (*GeneticAlgorithm* &algorithm)

  *This constructor has no implementation and cannot be used.*

### Private Attributes

- *Model* & **_model**

  *The Model known by this evaluator.*

13.64.1 **Detailed Description**

An evaluator specialization that knows how to interact with *Dakota*.

This evaluator knows how to use the model to do evaluations both in synchronous and asynchronous modes.

13.64.2 **Constructor & Destructor Documentation**

**Evaluator** ( *GeneticAlgorithm* & *algorithm*, *Model* & *model* ) [inline]

Constructs a *Evaluator* for use by *algorithm*.

The optimizer is needed for purposes of variable scaling.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>algorithm</code></td>
<td>The GA for which the new evaluator is to be used.</td>
</tr>
<tr>
<td><code>model</code></td>
<td>The model through which evaluations will be done.</td>
</tr>
</tbody>
</table>

**Evaluator ( const Evaluator & copy ) [inline]**

Copy constructs a Evaluator.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy</code></td>
<td>The evaluator from which properties are to be duplicated into this.</td>
</tr>
</tbody>
</table>

**Evaluator ( const Evaluator & copy, GeneticAlgorithm & algorithm, Model & model ) [inline]**

Copy constructs a Evaluator for use by algorithm.

The optimizer is needed for purposes of variable scaling.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy</code></td>
<td>The existing Evaluator from which to retrieve properties.</td>
</tr>
<tr>
<td><code>algorithm</code></td>
<td>The GA for which the new evaluator is to be used.</td>
</tr>
<tr>
<td><code>model</code></td>
<td>The model through which evaluations will be done.</td>
</tr>
</tbody>
</table>

**Evaluator ( GeneticAlgorithm & algorithm ) [private]**

This constructor has no implementation and cannot be used.

This constructor can never be used. It is provided so that this operator can still be registered in an operator registry even though it can never be instantiated from there.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>algorithm</code></td>
<td>The GA for which the new evaluator is to be used.</td>
</tr>
</tbody>
</table>

### 13.64.3 Member Function Documentation

**static const std::string& Name() [inline], [static]**

Returns the proper name of this operator.

Returns

The string "DAKOTA JEGA Evaluator".

**static const std::string& Description() [inline], [static]**

Returns a full description of what this operator does and how.

The returned text is:

This evaluator uses Sandia’s DAKOTA optimization software to evaluate the passed in Designs. This makes it possible to take advantage of the fact that DAKOTA is designed to run on massively parallel machines.
void SeparateVariables ( const Design & from, RealVector & intoCont, IntVector & intoDiscInt, RealVector & intoDiscReal, StringMultiArray & intoDiscString ) const [protected]

This method fills intoCont, intoDiscInt and intoDiscReal appropriately using the values of from. The discrete integer design variable values are placed in intoDiscInt, the discrete real design variable values are placed in intoDiscReal, and the continuum are placed into intoCont. The values are written into the vectors from the beginning so any previous contents of the vectors will be overwritten.

Parameters

<table>
<thead>
<tr>
<th>from</th>
<th>The Design class object from which to extract the discrete design variable values.</th>
</tr>
</thead>
<tbody>
<tr>
<td>intoDiscInt</td>
<td>The vector into which to place the extracted discrete integer values.</td>
</tr>
<tr>
<td>intoDiscReal</td>
<td>The vector into which to place the extracted discrete real values.</td>
</tr>
<tr>
<td>intoCont</td>
<td>The vector into which to place the extracted continuous values.</td>
</tr>
</tbody>
</table>

References JEGAOptimizer::Evaluator::model, Model::cv(), Model::discrete_int_sets(), Model::discrete_set_string_values(), Model::div(), Model::drv(), Model::dsv(), and Dakota::set_index_to_value().

void RecordResponses ( const RealVector & from, Design & into ) const [protected]

Records the computed objective and constraint function values into into.

This method takes the response values stored in from and properly transfers them into the into design. The response vector from is expected to contain values for each objective function followed by values for each non-linear constraint in the order in which the info objects were loaded into the target by the optimizer class.

Parameters

<table>
<thead>
<tr>
<th>from</th>
<th>The vector of responses to install into into.</th>
</tr>
</thead>
<tbody>
<tr>
<td>into</td>
<td>The Design to which the responses belong and into which they must be written.</td>
</tr>
</tbody>
</table>

std::size_t GetNumberNonLinearConstraints ( ) const [inline], [protected]

Returns the number of non-linear constraints for the problem. This is computed by adding the number of non-linear equality constraints to the number of non-linear inequality constraints. These values are obtained from the model.

Returns

The total number of non-linear constraints.

std::size_t GetNumberLinearConstraints ( ) const [inline], [protected]

Returns the number of linear constraints for the problem. This is computed by adding the number of linear equality constraints to the number of linear inequality constraints. These values are obtained from the model.

Returns

The total number of linear constraints.
bool Evaluate ( DesignGroup & group ) [virtual]

Does evaluation of each design in group.

This method uses the Model known by this class to get Designs evaluated. It properly formats the Design class information in a way that Dakota will understand and then interprets the Dakota results and puts them back into the Design class object. It respects the asynchronous flag in the Model so evaluations may occur synchronously or asynchronously.

Prior to evaluating a Design, this class checks to see if it is marked as already evaluated. If it is, then the evaluation of that Design is not carried out. This is not strictly necessary because Dakota keeps track of evaluated designs and does not re-evaluate. An exception is the case of a population read in from a file complete with responses where Dakota is unaware of the evaluations.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>The group of Design class objects to be evaluated.</td>
</tr>
</tbody>
</table>

Returns

ture if all evaluations completed and false otherwise.

virtual bool Evaluate ( Design & des ) [inline], [virtual]

This method cannot be used!!

This method does nothing and cannot be called. This is because in the case of asynchronous evaluation, this method would be unable to conform. It would require that each evaluation be done in a synchronous fashion.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>des</td>
<td>A Design that would be evaluated if this method worked.</td>
</tr>
</tbody>
</table>

Returns

Would return true if the Design were evaluated and false otherwise. Never actually returns here. Issues a fatal error. Otherwise, it would always return false.

virtual std::string GetName ( ) const [inline], [virtual]

Returns the proper name of this operator.

Returns

See Name().

virtual std::string GetDescription ( ) const [inline], [virtual]

Returns a full description of what this operator does and how.

Returns

See Description().

virtual GeneticAlgorithmOperator* Clone ( GeneticAlgorithm & algorithm ) const [inline], [virtual]

Creates and returns a pointer to an exact duplicate of this operator.
13.65. **JEGAOPTIMIZER::EVALUATORCREATOR CLASS REFERENCE**

Parameters

| algorithm | The GA for which the clone is being created. |

Returns

A clone of this operator.

### 13.64.4 Member Data Documentation

Model& _model [private]

The Model known by this evaluator.
- It is through this model that evaluations will take place.
- Referenced by JEGAOptimizer::Evaluator::SeparateVariables().
- The documentation for this class was generated from the following file:
  - JEGAOptimizer.cpp

13.65  **JEGAOptimizer::EvaluatorCreator Class Reference**

A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.

Inherits EvaluatorCreator.

**Public Member Functions**

- virtual GeneticAlgorithmEvaluator * CreateEvaluator (GeneticAlgorithm &alg)
  - Overridden to return a newly created Evaluator.
- EvaluatorCreator (Model &theModel)
  - Constructs an EvaluatorCreator using the supplied model.

**Private Attributes**

- Model & _theModel
  - The user defined model to be passed to the constructor of the Evaluator.

13.65.1  **Detailed Description**

A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.

13.65.2  **Constructor & Destructor Documentation**

EvaluatorCreator ( Model & theModel ) [inline]

Constructs an EvaluatorCreator using the supplied model.

Parameters
### 13.65.3 Member Function Documentation

```
virtual GeneticAlgorithmEvaluator* CreateEvaluator ( GeneticAlgorithm & alg ) [inline], [virtual]
```

Overridden to return a newly created `Evaluator`.

The GA will assume ownership of the evaluator so we needn’t worry about keeping track of it for destruction. The additional parameters needed by the `Evaluator` are stored as members of this class at construction time.

**Parameters**

- `alg` The GA for which the evaluator is to be created.

**Returns**

A pointer to a newly created `Evaluator`.

The documentation for this class was generated from the following file:

- `JEGAOptimizer.cpp`

### 13.66 ExecutableEnvironment Class Reference

`Environment` corresponding to execution as a stand-alone application.

Inheritance diagram for `ExecutableEnvironment`:

```
Environment

ExecutableEnvironment
```

**Public Member Functions**

- `ExecutableEnvironment ()`
  - default constructor
- `ExecutableEnvironment (int argc, char *argv[])`
  - constructor
- `~ExecutableEnvironment ()`
  - destructor
- `void execute ()`
  - the run function for the environment: invoke the iterator(s) on the model(s). Called from `main.cpp`.
13.67. EXPERIMENTDATA CLASS REFERENCE

Additional Inherited Members

13.66.1  Detailed Description

Environment corresponding to execution as a stand-alone application.

This environment corresponds to a stand-alone executable program, e.g., main.cpp. It sets up the Parallel-
Library, ProgramOptions, and ProblemDescDB objects based on access to command line arguments.

The documentation for this class was generated from the following files:

- ExecutableEnvironment.hpp
- ExecutableEnvironment.cpp

13.67  ExperimentData Class Reference

Interpolation method for interpolating between experimental and model data. I need to work on inputs/outputs to
this method. For now, this assumes interpolation of functional data.

Public Member Functions

- **ExperimentData ()**
  
  *default constructor*

- **ExperimentData (const ProblemDescDB &prob_desc_db, const SharedResponseData &srd, short output_level)**
  
  *typical DB-based constructor*

- **ExperimentData (size_t num_experiments, size_t num_config_vars, const boost::filesystem::path &data_prefix, const SharedResponseData &srd, const StringArray &variance_types, short output_level, std::string scalarDataFilename="")**
  
  *temporary? constructor for testing*

- **ExperimentData (size_t num_experiments, const SharedResponseData &srd, const RealMatrix &configVars, const IntResponseMap &all_responses, short output_level)**

- **void load_data (const std::string &context_message)**

  *Load experiments from data files (simple scalar or field)*

- **void add_data (const RealVector &one_configvars, const Response &one_response)**

  *Add one data point to the experimental data set.*

- **size_t num_experiments () const**

  *retrieve the number of experiments*

- **size_t num_total_exppoints () const**

  *retrieve the total number of experimental data points over all experiments*

- **size_t num_scalars () const**

  *retrieve the number of scalars (applies to all experiments)*

- **size_t num_fields () const**

  *retrieve the number of fields (applies to all experiments)*

- **size_t num_config_vars () const**

  *number of configuration variables*

- **const std::vector<RealVector> & config_vars () const**

  *values of the configuration variables, 1 RealVector per experiment*
• const RealVector & all_data (size_t experiment)
  return contiguous vector of all data (scalar, followed by field) for the specified experiment
• const Response & response (size_t experiment)
  return response for the specified experiment
• void per_exp_length (IntVector &per_length) const
  return the individual sizes of the experimental data lengths (all function values, scalar and field)
• const IntVector & field_lengths (size_t experiment) const
  return the field lengths for specified experiment index
• Real scalar_data (size_t response, size_t experiment) const
  retrieve the data value for the given response, for the given experiment
• RealVector field_data_view (size_t response, size_t experiment) const
  retrieve a view of the field data for the given response, for the given experiment
• RealMatrix field_coords_view (size_t response, size_t experiment) const
  retrieve a view of the field data coordinates for the given response, for the given experiment
• bool variance_type_active (short variance_type) const
  whether the specified variance type (enum value) is present and active
• bool variance_active () const
  whether any variance type is active
• Real apply_covariance (const RealVector &residuals, size_t experiment) const
  apply the covariance responses to compute the triple product $v^\top \text{inv}(C)v$ for the given experiment
• void apply_covariance_inv_sqrt (const RealVector &residuals, size_t experiment, RealVector &weighted_residuals) const
  apply inverse sqrt of the covariance to compute weighted residuals
• void apply_covariance_inv_sqrt (const RealMatrix &gradients, size_t experiment, RealMatrix &weighted_gradients) const
  apply inverse sqrt of the covariance to compute weighted gradients
• void apply_covariance_inv_sqrt (const RealSymMatrixArray &hessians, size_t experiment, RealSymMatrixArray &weighted_hessians) const
  apply inverse sqrt of the covariance to compute weighted Hessians
• void apply_simulation_error (const RealVector &simulation_error, size_t experiment)
  apply simulation error to experiment data
• void get_main_diagonal (RealVector &diagonal, size_t experiment) const
  return a (copy) vector containing the main diagonal entries of a specified experimental covariance matrix
• void cov_std_deviation (RealVectorArray &std_deviation) const
  get the standard deviation of the observation error process, one vector per experiment
• void cov_as_correlation (RealSymMatrixArray &corr_matrix) const
  get the observation error covariance as a correlation matrix, one vector per experiment
• void covariance (int exp_ind, RealSymMatrix &cov_mat) const
  retrieve an individual covariance entry as a dense matrix
• void form_residuals (const Response &sim_resp, Response &residual) const
  form residuals for all experiments, interpolating if necessary; one simulation response maps to all experiments
• void form_residuals (const Response &sim_resp, const size_t curr_exp, Response &residual) const
  Populate the portion of residual_resp corresponding to experiment curr_exp; the passed simulation response maps only to the specified experiment.
- void form_residuals (const Response &sim, size_t exp_num, const ShortArray &total_asv, size_t residual_offset, Response &residualResp) const
  form residuals for an individual experiment, interpolating if necessary
- void recover_model (size_t num_fns, RealVector &model_fns) const
  recover original model from the first experiment block in a full set of residuals; works in no interpolation case only
- bool interpolate_flag () const
  flag for interpolation. If 0, no interpolation. If 1, interpolate.
- void interpolate_simulation_data (const Response &sim_resp, size_t exp_num, const ShortArray &total_asv, size_t exp_offset, Response &interpResp) const
  Interpolate simulation data (values, gradients and hessians) onto the coordinates of the experimental data.
- void scale_residuals (const Response &residual_response, RealVector &scaled_residuals) const
  Apply the experiment data covariance to the residual data (scale functions by \( \text{Gamma}_{d}^{-1/2} \)), returning in scaled_residuals.
- void scale_residuals (Response &residual_response) const
  Apply the experiment data covariance to the residual data in-place (scale functions, gradients, and Hessians by \( \text{Gamma}_{d}^{-1/2} \))
- void build_gradient_of_sum_square_residuals (const Response &resp, RealVector &ssr_gradient)
  Build the gradient of the ssr from residuals and function gradients based on the response’s active set request vector.
- void build_gradient_of_sum_square_residuals (const Response &resp, const ShortArray &asrv, RealVector &ssr_gradient)
  Build the gradient of the ssr from residuals and function gradients using the passed active set request vector (overrides the response’s request vector)
- void build_gradient_of_sum_square_residuals_from_response (const Response &resp, const ShortArray &asrv, int exp_ind, RealVector &ssr_gradient)
  Update the gradient of ssr with the values from the gradient associated with a single experiment.
- void build_gradient_of_sum_square_residuals_from_function_data (const RealMatrix &func_gradients, const RealVector &residuals, RealVector &ssr_gradient, const ShortArray &asrv)
  Construct the gradient of the sum of squares of residuals.
- void build_hessian_of_sum_square_residuals (const Response &resp, RealSymMatrix &ssr_hessian)
  Build the hessian of the ssr from residuals, function gradients and function Hessians based on the response’s active set request vector.
- void build_hessian_of_sum_square_residuals (const Response &resp, const ShortArray &asrv, RealSymMatrix &ssr_hessian)
  Build the hessian of the ssr from residuals, function gradients and function Hessians using the passed active set request vector (overrides the response’s request vector)
- void build_hessian_of_sum_square_residuals_from_response (const Response &resp, const ShortArray &asrv, int exp_ind, RealSymMatrix &ssr_hessian)
  Update the hessian of ssr with the values from the hessian associated with a single experiment.
- void build_hessian_of_sum_square_residuals_from_function_data (const RealSymMatrixArray &func_hessians, const RealMatrix &func_gradients, const RealVector &residuals, RealSymMatrix &ssr_hessian, const ShortArray &asrv)
  Construct the hessian of the sum of squares of residuals.
- void scale_residuals (const RealVector &multipliers, unsigned short multiplier_mode, size_t num_calib_params, Response &residual_response) const
in-place scale the residual response (functions, gradients, Hessians) by sqrt(multipliers), according to blocks indicated by multiplier mode

- **Real cov_determinant** (const RealVector &multipliers, unsigned short multiplier_mode) const
  returns the determinant of (covariance block-scaled by the passed multipliers)
- **Real half_log_cov_determinant** (const RealVector &multipliers, unsigned short multiplier_mode) const
  returns the log of the determinant of (covariance block-scaled by the passed multipliers)
- **void half_log_cov_det_gradient** (const RealVector &multipliers, unsigned short multiplier_mode, size_t hyper_offset, RealVector &gradient) const
  populated the passed gradient with derivatives w.r.t. the hyper-parameter multipliers, starting at hyper_offset (must be sized)
- **void half_log_cov_det_hessian** (const RealVector &multipliers, unsigned short multiplier_mode, size_t hyper_offset, RealSymMatrix &hessian) const
  populated the passed Hessian with derivatives w.r.t. the hyper-parameter multipliers, starting at hyper_offset (must be sized)
- **StringArray hyperparam_labels** (unsigned short multiplier_mode) const
  generate variable labels for the covariance (error) multiplier hyperparams

Protected Member Functions

- **ShortArray determine_active_request** (const Response &resid_resp) const
  Perform check on the active request vector to make sure it is amenable to interpolation of simulation data and application of apply covariance.
- **SizetArray residuals_per_multiplier** (unsigned short multiplier_mode) const
  count the number of residuals influenced by each multiplier
- **void generate_multipliers** (const RealVector &multipliers, unsigned short multiplier_mode, RealVector &expanded_multipliers) const
  Generate a set of multipliers commensurate with the residual size for the total experiment data set. Instead of repeating the loops all over the place, generate an expanded set of multipliers; the conditionals get too complicated otherwise.
- **void resid2mult_map** (unsigned short multiplier_mode, IntVector &resid2mult_indices) const
  return the index of the multiplier that affects each residual

Private Member Functions

- **void initialize** (const StringArray &variance_types, const SharedResponseData &srd)
  shared body of constructor initialization
- **void parse_sigma_types** (const StringArray &sigma_types)
  parse user-provided sigma type strings and populate enums
- **void load_experiment** (size_t exp_index, std::ifstream &scalar_data_stream, size_t num_field_sigma_matrices, size_t num_field_sigma_diagonals, size_t num_field_sigma_scalars, size_t num_field_sigma_none, Response &exp_resp)
  Load a single experiment exp_index into exp_resp.
- **void read_scalar_sigma** (std::ifstream &scalar_data_stream, RealVector &sigma_scalars, IntVector &scalar_map_indices)
  read or default populate the scalar sigma
- **RealVector residuals_view** (const RealVector &residuals, size_t experiment) const
Return a view (to allowing updating in place) of the residuals associated with a given experiment, from a vector containing residuals from all experiments.

- **RealMatrix gradients_view** (const RealMatrix &gradients, size_t experiment) const
  
  Return a view (to allowing updating in place) of the gradients associated with a given experiment, from a matrix containing gradients from all experiments.

- **RealSymMatrixArray hessians_view** (const RealSymMatrixArray &hessians, size_t experiment) const
  
  Return a view (to allowing updating in place) of the hessians associated with a given experiment, from an array containing the hessians from all experiments.

**Private Attributes**

- **bool calibrationDataFlag**
  
  whether the user specified a calibration data block

- **size_t numExperiments**
  
  the total number of experiments

- **size_t numConfigVars**
  
  number of configuration (state) variables to read for each experiment

- **UShortArray varianceTypes**
  
  type of variance specified for each variable, one per response group; empty varianceType indicates none specified by user

- **Real covarianceDeterminant**
  
  cached product of each experiment covariance’s determinant

- **Real logCovarianceDeterminant**
  
  cached sum of each experiment covariance’s log determinant

- **boost::filesystem::path dataPathPrefix**
  
  path to prepend to any data file names

- **String scalarDataFilename**
  
  the user-specified scalar data filename

- **unsigned short scalarDataFormat**
  
  tabular format of the simple scalar data file; supports TABULAR_NONE, TABULAR_HEADER, TABULAR_EVAL_ID, TABULAR_EXPER_ANNOT

- **size_t scalarSigmaPerRow**
  
  number of sigma values to read from each row in simple data file format (calculated from variance types strings

- **bool readSimFieldCoords**
  
  whether to read coordinate data files for simulation fields

- **SharedResponseData simulationSRD**
  
  archived shared data for use in sizing fields, total functions (historically we read all functions, including constraints, which might not be correct)

- **bool interpolateFlag**
  
  flag for interpolation.

- **short outputLevel**
  
  output verbosity level

- **std::vector< Response > allExperiments**
  
  Vector of numExperiments ExperimentResponses, holding the observed data and error (sigma/covariance) for each experiment.
• std::vector<RealVector> allConfigVars  
  Vector of numExperiments configurations at which data were gathered; empty if no configurations specified.

• IntVector experimentLengths  
  Length of each experiment.

• IntVector expOffsets  
  function index offsets for individual experiment data sets

13.67.1 Detailed Description

Interpolation method for interpolating between experimental and model data. I need to work on inputs/outputs to this method. For now, this assumes interpolation of functional data.

As Brian suggested, this class has the experimental data (coordinates and RealVectorArray interpolated-Results; The ExperimentData class is used to read and populate data (currently from user-specified files and/or the input spec) relating to experimental (physical observations) data for the purposes of calibration. Such data may include (for example): number of experiments, configuration variables, type of data (scalar vs. functional), treatment of sigma (experimental uncertainties). This class also provides an interpolation capability to interpolate between simulation or experimental data so that the differencing between simulation and experimental data may be performed properly.

13.67.2 Member Function Documentation

void form_residuals ( const Response & sim_resp, Response & residual_resp ) const

form residuals for all experiments, interpolating if necessary; one simulation response maps to all experiments

This assumes the source gradient/Hessian are size less or equal to the destination response, and that the leading part is to be populated.

References ExperimentData::determine_active_request(), ExperimentData::numExperiments, and ExperimentData::per_exp_length().

Referenced by DataTransformModel::archive_submodel_responses(), DataTransformModel::derived_evaluate(), ExperimentData::form_residuals(), DataTransformModel::primary_resp_differencer(), and DataTransformModel::transform_response_map().

void form_residuals ( const Response & sim_resp, size_t exp_ind, const ShortArray & total_asv, size_t exp_offset, Response & residual_resp ) const

form residuals for an individual experiment, interpolating if necessary

This assumes the source gradient/Hessian are size less or equal to the destination response, and that the leading part is to be populated.

References ExperimentData::allExperiments, ExperimentData::field_data_view(), Response::field_length(), Response::function_gradient_view(), Response::function_gradients(), Response::function_hessian_view(), Response::function_hessians(), Response::function_values_view(), ExperimentData::gradients_view(), ExperimentData::hessians_view(), ExperimentData::interpolate_simulation_data(), ExperimentData::interpolateFlag, ExperimentData::num_fields(), ExperimentData::num_scalars(), and ExperimentData::outputLevel.

void recover_model ( size_t num_pri_fns, RealVector & best_fns ) const

recover original model from the first experiment block in a full set of residuals; works in no interpolation case only (sizes same)
Add the data back to the residual to recover the model, for use in surrogated-based LSQ where DB lookup will fail (need approx eval DB). best_fns contains primary and secondary responses.

References Dakota::abort_handler(), ExperimentData::allExperiments, Response::function_value(), ExperimentData::interpolateFlag, and Response::num_functions().

```cpp
void build_gradient_of_sum_square_residuals_from_function_data ( const RealMatrix & func_gradients,
const RealVector & residuals, RealVector & ssr_gradient, const ShortArray & asrv )
```

Construct the gradient of the sum of squares of residuals.

<table>

```cpp
void scale_residuals ( const RealVector & multipliers, unsigned short multiplier_mode, size_t num_calib_params, Response & residual_response ) const
```

In-place scale the residual response (functions, gradients, Hessians) by sqrt(multipliers), according to blocks indicated by multiplier mode.

In-place scaling of residual response by hyper-parameter multipliers.

References Dakota::abort_handler(), Response::active_set_request_vector(), Response::function_gradient_view(), Response::function_hessian_view(), Response::function_value(), Response::function_value_view(), ExperimentData::num_total_exppoints(), and ExperimentData::resid2mult_map().

```cpp
Real cov_determinant ( const RealVector & multipliers, unsigned short multiplier_mode ) const
```

returns the determinant of (covariance block-scaled by the passed multipliers)

Determinant of the total covariance used in inference, which has blocks mult_i * I * Cov_i.

References Dakota::abort_handler(), ExperimentData::covarianceDeterminant, ExperimentData::generate_multipliers(), and ExperimentData::num_total_exppoints().
Real half_log_cov_determinant ( const RealVector & multipliers, unsigned short multiplier_mode ) const

returns the log of the determinant of (covariance block-scaled by the passed multipliers)

Determinant of half the log of total covariance used in inference, which has blocks mult_i * I * Cov_i.
References Dakota::abort_handler(), ExperimentData::generate_multipliers(), ExperimentData::logCovariance-Determinant, and ExperimentData::num_total_exppoints().
Referenced by NonDBayesCalibration::log_likelihood(), and NonDQUESOBayesCalibration::print_results().

void half_log_cov_det_gradient ( const RealVector & multipliers, unsigned short multiplier_mode, size_t hyper_offset, RealVector & gradient ) const

populated the passed gradient with derivatives w.r.t. the hyper-parameter multipliers, starting at hyper_offset (must be sized)

Compute the gradient of scalar f(m) 0.5 log(det(mult*Cov)) w.r.t. mults. Since this is the only use case, we include the 0.5 factor and perform an update in-place.
References ExperimentData::num_total_exppoints(), and ExperimentData::residuals_per_multiplier().
Referenced by NonDBayesCalibration::neg_log_post_resp_mapping().

void half_log_cov_det_hessian ( const RealVector & multipliers, unsigned short multiplier_mode, size_t hyper_offset, RealSymMatrix & hessian ) const

populated the passed Hessian with derivatives w.r.t. the hyper-parameter multipliers, starting at hyper_offset (must be sized)

Compute the gradient of scalar f(m) log(det(mult*Cov)) w.r.t. mults
References ExperimentData::num_total_exppoints(), and ExperimentData::residuals_per_multiplier().
Referenced by NonDBayesCalibration::calculate_evidence(), and NonDBayesCalibration::neg_log_post_resp_mapping().

SizetArray residuals_per_multiplier ( unsigned short multiplier_mode ) const [protected]

count the number of residuals influenced by each multiplier

Calculate how many residuals each multiplier affects
References ExperimentData::allExperiments, SharedResponseData::num_field_response_groups(), ExperimentData::num_fields(), SharedResponseData::num_response_groups(), SharedResponseData::num_scalar_responses(), ExperimentData::numExperiments, and ExperimentData::simulationSRD.
Referenced by ExperimentData::half_log_cov_det_gradient(), and ExperimentData::half_log_cov_det_hessian().

void parse_sigma_types ( const StringArray & sigma_types ) [private]

parse user-provided sigma type strings and populate enums

Validate user-provided sigma specification. User can specify 0, 1, or num_response_groups sigmas. If specified, sigma types must be the same for all scalar responses.
References Dakota::abort_handler(), SharedResponseData::num_response_groups(), SharedResponseData::num_scalar_responses(), ExperimentData::scalarDataFilename, ExperimentData::scalarSigmaPerRow, ExperimentData::simulationSRD, and ExperimentData::varianceTypes.
Referenced by ExperimentData::initialize().
void load_experiment ( size_t exp_index, std::ifstream & scalar_data_stream, size_t num_field_sigma_matrices, size_t num_field_sigma_diagonals, size_t num_field_sigma_scalars, size_t num_field_sigma_none, Response & exp_resp ) [private]

Load a single experiment exp_index into exp_resp.

Load an experiment from a mixture of legacy format data and field data format files

References Dakota::abort_handler(), Dakota::convert_to_string(), ExperimentData::dataPathPrefix, Response::field_coords(), Response::field_group_labels(), ExperimentData::field_lengths(), Response::field_values(), Response::function_labels(), Response::function_value(), Dakota::is_matrix_symmetric(), SharedResponseData::num_field_response_groups(), ExperimentData::num_fields(), SharedResponseData::num_scalar_responses(), ExperimentData::num_scalars(), Dakota::read_coord_values(), Dakota::read_covariance(), Dakota::read_field_values(), ExperimentData::read_scalar_sigma(), ExperimentData::scalarDataFilename, ExperimentData::scalarSigmaPerRow, Response::set_full_covariance(), ExperimentData::simulationSRD, and ExperimentData::varianceTypes.

13.68.1 Detailed Description

Container class for response functions and their derivatives. ExperimentResponse provides the body class.

The ExperimentResponse class is the "representation" of the response container class. It is the "body" portion of the "handle-body idiom" (see Coplien "Advanced C++", p. 58). The handle class (Response) provides for memory efficiency in management of multiple response objects through reference counting and representation sharing. The body class (ExperimentResponse) actually contains the response data (functionValues, function-Gradients, functionHessians, etc.). The representation is hidden in that an instance of ExperimentResponse may only be created by Response. Therefore, programmers create instances of the Response handle class, and only need to be aware of the handle/body mechanisms when it comes to managing shallow copies (shared representation) versus deep copies (separate representation used for history mechanisms).

The documentation for this class was generated from the following files:

• ExperimentResponse.hpp
• ExperimentResponse.cpp
13.69 FileReadException Class Reference

base class for Dakota file read exceptions (to allow catching both tabular and general file truncation issues)

Inheritance diagram for FileReadException:

- void wait_local_evaluations (PRPQueue &prp_queue)
  For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.

- void test_local_evaluations (PRPQueue &prp_queue)
  For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.

- pid_t create_analysis_process (bool block_flag, bool new_group)
  spawn a child process for an analysis component within an evaluation using fork()/execvp() and wait for completion using waitpid() if block_flag is true

- size_t wait_local_analyses ()
  wait for asynchronous analyses on the local processor, completing at least one job

- size_t test_local_analyses_send (int analysis_id)
  test for asynchronous analysis completions on the local processor and return results for any completions by sending messages

- void join_evaluation_process_group (bool new_group)
  create (if new_group) and join the process group for async evaluations

- void join_analysis_process_group (bool new_group)
  create (if new_group) and join the process group for async analyses

- void evaluation_process_group_id (pid_t pgid)
  set evalProcGroupId

- pid_t evaluation_process_group_id () const
  return evalProcGroupId

- void analysis_process_group_id (pid_t pgid)
  set analysisProcGroupId

- pid_t analysis_process_group_id () const
  return analysisProcGroupId

- pid_t wait_evaluation (bool block_flag)
  process all available completions within the evaluation process group; if block_flag = true, wait for at least one completion

- pid_t wait_analysis (bool block_flag)
  process all available completions within the analysis process group; if block_flag = true, wait for at least one completion

- void check_group (int err, pid_t proc_group_id)
  check the exit status of setpgid and abort if an error code was returned

Private Member Functions

- pid_t wait (pid_t proc_group_id, std::map< pid_t, int > &process_id_map, bool block_flag)
  core code used by wait_{evaluation,analysis}()

- void join_process_group (pid_t &process_group_id, bool new_group)
  core code used by join_{evaluation,analysis}_{process_group}()
Private Attributes

- `pid_t evalProcGroupId`
  the process group id used to identify a set of child evaluation processes used by this interface instance (to distinguish from other interface instances that could be running at the same time)

- `pid_t analysisProcGroupId`
  the process group id used to identify a set of child analysis processes used by this interface instance (to distinguish from other interface instances that could be running at the same time)

Additional Inherited Members

13.70.1 Detailed Description

Derived application interface class which spawns simulation codes using fork/execvp/waitpid. `ForkApplicInterface` is used on Unix systems and is a peer to `SpawnApplicInterface` for Windows systems.

The documentation for this class was generated from the following files:

- `ForkApplicInterface.hpp`
- `ForkApplicInterface.cpp`

13.71 FSUDesignCompExp Class Reference

Wrapper class for the FSUDace QMC/CVT library.

Inheritance diagram for FSUDesignCompExp:

```
  IntelliJ IDEA
  FSUDesignCompExp
    PStudyDACE
      Analyzer
        Iterator
          Iterator
```

Public Member Functions

- `FSUDesignCompExp (ProblemDescDB &problem_db, Model &model)`
  primary constructor for building a standard DACE iterator

- `FSUDesignCompExp (Model &model, int samples, int seed, unsigned short sampling_method)`
  alternate constructor for building a DACE iterator on-the-fly

- `~FSUDesignCompExp ()`
  destructor

- `bool resize ()`
  reinitializes iterator based on new variable size
Protected Member Functions

- void pre_run()
  
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori
- void core_run()
  
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
- void post_input()
  
  read tabular data for post-run mode
- void post_run(ostream &s)
  
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way
- int num_samples() const
- void sampling_reset(int min_samples, bool all_data_flag, bool stats_flag)
  
  reset sampling iterator to use at least min_samples
- unsigned short sampling_scheme() const
  
  return sampling name
- void vary_pattern(bool pattern_flag)
  
  sets varyPattern in derived classes that support it
- void get_parameter_sets(Model &model)
  
  Generate one block of numSamples samples (ndim * num_samples), populating allSamples; ParamStudy is the only class that specializes to use allVariables.
- void get_parameter_sets(Model &model, const int num_samples, RealMatrix &design_matrix)
  
  Generate one block of numSamples samples (ndim * num_samples), populating design_matrix.

Private Member Functions

- void enforce_input_rules()
  
  enforce sanity checks/modifications for the user input specification

Private Attributes

- int samplesSpec
  
  initial specification of number of samples
- int numSamples
  
  current number of samples to be evaluated
- bool allDataFlag
  
  flag which triggers the update of allVars/allResponses for use by Iterator::all_variables() and Iterator::all_responses()
- size_t numDACERuns
  
  counter for number of executions for this object
- bool latinizeFlag
  
  flag which specifies latinization of QMC or CVT sample sets
- IntVector sequenceStart
  
  Integer vector defining a starting index into the sequence for random variable sampled. Default is 0 0 0 (e.g. for three random variables).
13.71. FSUDESIGNCOMPEXP CLASS REFERENCE

- **IntVector sequenceLeap**  
  Integer vector defining the leap number for each sequence being generated. Default is 1 1 1 (e.g. for three random vars.)

- **IntVector primeBase**  
  Integer vector defining the prime base for each sequence being generated. Default is 2 3 5 (e.g., for three random vars.)

- **int seedSpec**  
  The user seed specification for the random number generator (allows repeatable results)

- **int randomSeed**  
  Current seed for the random number generator

- **bool varyPattern**  
  Flag for continuing the random number or QMC sequence from a previous execution (e.g., for surrogate-based optimization) so that multiple executions are repeatable but not identical.

- **int numCVTTrials**  
  Specifies the number of sample points taken at internal CVT iteration

- **int trialType**  
  Trial type in CVT. Specifies where the points are placed for consideration relative to the centroids. Choices are grid (2), halton (1), uniform (0), or random (-1). Default is random.

### Additional Inherited Members

#### 13.71.1 Detailed Description

Wrapper class for the FSUDace QMC/CVT library.

The FSUDesignCompExp class provides a wrapper for FSUDace, a C++ design of experiments library from Florida State University. This class uses quasi Monte Carlo (QMC) and Centroidal Voronoi Tessellation (CVT) methods to uniformly sample the parameter space spanned by the active bounds of the current Model. It returns all generated samples and their corresponding responses as well as the best sample found.

#### 13.71.2 Constructor & Destructor Documentation

**FSUDesignCompExp ( ProblemDescDB & problem_db, Model & model )**

Primary constructor for building a standard DACE iterator

This constructor is called for a standard iterator built with data from probDescDB.

References Dakota::abort_handler(), ProblemDescDB::get_bool(), ProblemDescDB::get_int(), ProblemDescDB::get_iv(), ProblemDescDB::get_string(), Iterator::maxEvalConcurrency, Iterator::methodName, Analyzer::numContinuousVars, FSUDesignCompExp::numCVTTrials, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, FSUDesignCompExp::numSamples, FSUDesignCompExp::primeBase, Iterator::probDescDB, FSUDesignCompExp::randomSeed, FSUDesignCompExp::seedSpec, FSUDesignCompExp::sequenceLeap, FSUDesignCompExp::sequenceStart, FSUDesignCompExp::trialType, and FSUDesignCompExp::varyPattern.

**FSUDesignCompExp ( Model & model, int samples, int seed, unsigned short sampling_method )**

Alternate constructor for building a DACE iterator on-the-fly

This alternate constructor is used for instantiations on-the-fly, using only the incoming data. No problem description database queries are used.
CHAPTER 13. CLASS DOCUMENTATION

References Dakota::abort_handler(), Iterator::maxEvalConcurrency, Analyzer::numContinuousVars, FSUDesignCompExp::numCVTrials, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, FSUDesignCompExp::numSamples, FSUDesignCompExp::primeBase, FSUDesignCompExp::randomSeed, FSUDesignCompExp::seedSpec, FSUDesignCompExp::sequenceLeap, FSUDesignCompExp::sequenceStart, and FSUDesignCompExp::trialType.

13.71.3 Member Function Documentation

void pre_run ( ) [protected], [virtual]

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented from Analyzer.

References FSUDesignCompExp::enforce_input_rules(), FSUDesignCompExp::get_parameter_sets(), Analyzer::get_vbd_parameter_sets(), Iterator::iteratedModel, FSUDesignCompExp::numSamples, Analyzer::pre_run(), and PStudyDACE::varBasedDecompFlag.

void core_run ( ) [protected], [virtual]

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.

References FSUDesignCompExp::allDataFlag, Analyzer::evaluate_parameter_sets(), Iterator::iteratedModel, Analyzer::numLSqTerms, Analyzer::numObjFns, and Iterator::subIteratorFlag.

void post_run ( std::ostream & s ) [protected], [virtual]

post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically after performing its own implementation steps.

Reimplemented from Analyzer.

References Analyzer::allResponses, Analyzer::allSamples, SensAnalysisGlobal::compute_correlations(), Analyzer::compute_vbd_stats(), FSUDesignCompExp::enforce_input_rules(), FSUDesignCompExp::numSamples, Analyzer::post_run(), PStudyDACE::pStudyDACEGlobal, Iterator::subIteratorFlag, and PStudyDACE::varBasedDecompFlag.

int num_samples ( ) const [inline], [protected], [virtual]

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Analyzer.

References FSUDesignCompExp::numSamples.

Referenced by FSUDesignCompExp::get_parameter_sets().
void enforce_input_rules() [private]
enforce sanity checks/modifications for the user input specification

Users may input a variety of quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

References Dakota::abort_handler(), Iterator::methodName, Analyzer::numContinuousVars, FSUDesignCompExp::numSamples, and FSUDesignCompExp::primeBase.

Referenced by FSUDesignCompExp::post_input(), FSUDesignCompExp::post_run(), and FSUDesignCompExp::pre_run().

The documentation for this class was generated from the following files:

- FSUDesignCompExp.hpp
- FSUDesignCompExp.cpp

13.72 FunctionEvalFailure Class Reference

exception class for function evaluation failures

Inherits runtime_error.

Public Member Functions

- FunctionEvalFailure (const std::string &msg)

13.72.1 Detailed Description

exception class for function evaluation failures

The documentation for this class was generated from the following file:

- dakota_global_defs.hpp

13.73 GaussProcApproximation Class Reference

Derived approximation class for Gaussian Process implementation.

Inheritance diagram for GaussProcApproximation:

```
Approximation
\|
GaussProcApproximation
```
• **GaussProcApproximation** (const ProblemDescDB &problem_db, const SharedApproxData &shared_data, const String &approx_label)
  
  *standard constructor*

• **~GaussProcApproximation** ()
  
  *destructor*

### Protected Member Functions

• **int min_coefficients** () const

  *return the minimum number of samples (unknowns) required to build the derived class approximation type in num-Vars dimensions*

• **void build** ()

  *find the covariance parameters governing the Gaussian process response*

• **Real value** (const Variables &vars)

  *retrieve the function value for a given parameter set*

• **const RealVector & gradient** (const Variables &vars)

  *retrieve the function gradient at the predicted value for a given parameter set*

• **Real prediction_variance** (const Variables &vars)

  *retrieve the variance of the predicted value for a given parameter set*

### Private Member Functions

• **void GPmodel_build** ()

  *Function to compute hyperparameters governing the GP.*

• **void GPmodel_apply** (const RealVector &new_x, bool variance_flag, bool gradients_flag)

  *Function returns a response value using the GP surface.*

• **void normalize_training_data** ()

  *Normalizes the initial inputs upon which the GP surface is based.*

• **void get_trend** ()

  *Gets the trend (basis) functions for the calculation of the mean of the GP If the order = 0, the trend is a constant, if the order = 1, trend is linear, if order = 2, trend is quadratic.*

• **void get_beta_coefficients** ()

  *Gets the beta coefficients for the calculation of the mean of the GP.*

• **int get_cholesky_factor** ()

  *Gets the Cholesky factorization of the covariance matrix, with error checking.*

• **void get_process_variance** ()

  *Gets the estimate of the process variance given the values of beta and the correlation lengthscales.*

• **void get_cov_matrix** ()

  *calculates the covariance matrix for a given set of input points*

• **void get_cov_vector** ()

  *calculates the covariance vector between a new point x and the set of inputs upon which the GP is based*

• **void optimize_theta_global** ()

  *sets up and performs the optimization of the negative log likelihood to determine the optimal values of the covariance parameters using NCSUDirect*

• **void optimize_theta_multipoint** ()
sets up and performs the optimization of the negative log likelihood to determine the optimal values of the covariance parameters using a gradient-based solver and multiple starting points

- **void predict** (bool variance_flag, bool gradients_flag)
  Calculates the predicted new response value for $x$ in normalized space.

- **Real calc_nll** ()
  Calculates the negative log likelihood function (based on covariance matrix)

- **void calc_grad_nll** ()
  Gets the gradient of the negative log likelihood function with respect to the correlation lengthscales, $\theta$.

- **void get_grad_cov_vector** ()
  Calculate the derivatives of the covariance vector, with respect to each component of $x$.

- **void run_point_selection** ()
  Runs the point selection algorithm, which will choose a subset of the training set with which to construct the GP model, and estimate the necessary parameters.

- **void initialize_point_selection** ()
  Initializes the point selection routine by choosing a small initial subset of the training points.

- **void pointsel_get_errors** (RealArray &delta)
  Uses the current GP model to compute predictions at all of the training points and find the errors.

- **int addpoint** (int, IntArray &added_index)
  Adds a point to the effective training set. Returns 1 on success.

- **int pointsel_add_sel** (const RealArray &delta)
  Accepts a vector of unsorted prediction errors, determines which points should be added to the effective training set, and adds them.

- **Real maxval** (const RealArray &)
  Return the maximum value of the elements in a vector.

- **void pointsel_write_points** ()
  Writes out the training set before and after point selection.

- **void lhood_2d_grid_eval** ()
  For problems with 2D input, evaluates the negative log likelihood on a grid.

- **void writex** (const char[ ])
  Writes out the current training set (in original units) to a specified file.

- **void writeCovMat** (char[ ])
  Writes out the covariance matrix to a specified file.

**Static Private Member Functions**

- **static void negloglik** (int mode, int n, const Teuchos::SerialDenseVector< int, double > &X, Real &fx, Teuchos::SerialDenseVector< int, double > &grad_x, int &result_mode)
  static function used by OPT++ as the objective function to optimize the hyperparameters in the covariance of the GP by minimizing the negative log likelihood

- **static void constraint_eval** (int mode, int n, const Teuchos::SerialDenseVector< int, double > &X, Teuchos::SerialDenseVector< int, double > &g, Teuchos::SerialDenseMatrix< int, double > &gradC, int &result_mode)
  static function used by OPT++ as the constraint function in the optimization of the negative log likelihood. Currently this function is empty: it is an unconstrained optimization.

- **static double negloglikNCSU** (const RealVector &x)
  function used by NCSU/Optimizer to optimize negloglik objective
Private Attributes

- **Real approxValue**
  value of the approximation returned by `value()`
- **Real approxVariance**
  value of the approximation returned by `prediction_variance()`
- **RealMatrix trainPoints**
  A 2-D array (num sample sites = rows, num vars = columns) used to create the Gaussian process.
- **RealMatrix trainValues**
  An array of response values; one response value per sample site.
- **RealVector trainMeans**
  The mean of the input columns of `trainPoints`.
- **RealVector trainStdvs**
  The standard deviation of the input columns of `trainPoints`.
- **RealMatrix normTrainPoints**
  Current working set of normalized points upon which the GP is based.
- **RealMatrix trendFunction**
  matrix to hold the trend function
- **RealMatrix betaCoeffs**
  matrix to hold the beta coefficients for the trend function
- **RealSymMatrix covMatrix**
  The covariance matrix where each element (i,j) is the covariance between points Xi and Xj in the initial set of samples.
- **RealMatrix covVector**
  The covariance vector where each element (j,0) is the covariance between a new point X and point Xj from the initial set of samples.
- **RealMatrix approxPoint**
  Point at which a prediction is requested. This is currently a single point, but it could be generalized to be a vector of points.
- **RealMatrix gradNegLogLikTheta**
  matrix to hold the gradient of the negative log likelihood with respect to the theta correlation terms
- **Teuchos::SerialSpdDenseSolver< int, Real > covSlvr**
  The global solver for all computations involving the inverse of the covariance matrix.
- **RealMatrix gradCovVector**
  A matrix, where each column is the derivative of the `covVector` with respect to a particular component of X.
- **RealMatrix normTrainPointsAll**
  Set of all original samples available.
- **RealMatrix trainValuesAll**
  All original samples available.
- **RealMatrix trendFunctionAll**
  Trend function values corresponding to all original samples.
- **RealMatrix Rinv_YFb**
  Matrix for storing inverse of correlation matrix Rinv*(Y-FB)
• size_t numObs

  The number of observations on which the GP surface is built.

• size_t numObsAll

  The original number of observations.

• short trendOrder

  The number of variables in each X variable (number of dimensions of the problem).

• RealVector thetaParams

  Theta is the vector of covariance parameters for the GP. We determine the values of theta by optimization. Currently, the covariance function is \( \theta[0] \times \exp(-0.5 \times \text{sume}) + \delta \times \text{pow}(\text{signe}, 2) \). \text{sume} is the sum squared of weighted distances: it involves a sum of \( \theta[1](x_i(1) - x_j(1))^2 + \theta[2](x_i(2) - x_j(2))^2 + \cdots \) where \( x_i(1) \) is the first dimension value of multi-dimensional variable \( x_i \). \delta \times \text{pow}(\text{signe}, 2) \) is a jitter term used to improve matrix computations.

  \( \text{delta} \) is zero for the covariance between different points and 1 for the covariance between the same point. \text{signe} is the underlying process error.

• Real procVar

  The process variance, the multiplier of the correlation matrix.

• IntArray pointsAddedIndex

  Used by the point selection algorithm, this vector keeps track all points which have been added.

• int cholFlag

  A global indicator for success of the Cholesky factorization.

• bool usePointSelection

  A flag to indicate the use of point selection

Static Private Attributes

• static GaussProcApproximation * GPInstance

  pointer to the active object instance used within the static evaluator

Additional Inherited Members

13.73.1 Detailed Description

Derived approximation class for Gaussian Process implementation.

The GaussProcApproximation class provides a global approximation (surrogate) based on a Gaussian process. The Gaussian process is built after normalizing the function values, with zero mean. Opt++ is used to determine the optimal values of the covariance parameters, those which minimize the negative log likelihood function.

13.73.2 Constructor & Destructor Documentation

GaussProcApproximation( ) [inline]

default constructor

alternate constructor used by EffGlobalOptimization and NonDGlobalReliability that does not use a problem database defaults here are no point selectinn and quadratic trend function.
13.73.3 Member Function Documentation

```cpp
void GPmodel::apply ( const RealVector & new_x, bool variance_flag, bool gradients_flag ) [private]
```

Function returns a response value using the GP surface. The response value is computed at the design point specified by the RealVector function argument. Referenced Dakota::abort_handler(). GaussProcApproximation::approxPoint, GaussProcApproximation::get_cov_vector(), SharedApproxData::numVars, GaussProcApproximation::predict(), Approximation::sharedDataRep, GaussProcApproximation::trainMeans, and GaussProcApproximation::trainStdvs.

Referenced by GaussProcApproximation::gradient(), GaussProcApproximation::pointsel_get_errors(), GaussProcApproximation::prediction_variance(), and GaussProcApproximation::value().

13.73.4 Member Data Documentation

```cpp
short trendOrder [private]
```

The number of variables in each X variable (number of dimensions of the problem). The order of the basis function for the mean of the GP If the order = 0, the trend is a constant, if the order = 1, trend is linear, if order = 2, trend is quadratic.

Referenced by GaussProcApproximation::GaussProcApproximation(), GaussProcApproximation::get_beta_coefficients(), GaussProcApproximation::get_trend(), GaussProcApproximation::GPmodel_build(), and GaussProcApproximation::predict().

The documentation for this class was generated from the following files:

- DakotaVariables.hpp
- GaussProcApproximation.hpp
- GaussProcApproximation.cpp

13.74 GeneralReader Class Reference

Utility used in derived read_core to read in generic format.

Public Member Functions

- template<typename ArrayType >
  ```cpp
  void operator() ( std::istream &s, size_t start_index, size_t num_items, ArrayType &array_data, StringMultiArrayView label_array)
  ```

13.74.1 Detailed Description

Utility used in derived read_core to read in generic format. The documentation for this class was generated from the following file:

- DakotaVariables.hpp

13.75 GeneralWriter Class Reference

Utility used in derived write_core to write in generic format.
Public Member Functions

- `template<typename ArrayType>
  void operator() (std::ostream &s, size_t start_index, size_t num_items, const ArrayType &array_data, StringMultiArrayConstView label_array)

13.75.1 Detailed Description

Utility used in derived write_core to write in generic format.

The documentation for this class was generated from the following file:

- DakotaVariables.hpp

13.76 GetLongOpt Class Reference

GetLongOpt is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France).

Inheritance diagram for GetLongOpt:

```
GetLongOpt
    CommandLineHandler
```

Public Types

- `enum OptType { Valueless, OptionalValue, MandatoryValue }
  enum for different types of values associated with command line options.

Public Member Functions

- `GetLongOpt (const char optmark= '-')
  Constructor.
- `~GetLongOpt ()
  Destructor.
- `int parse (int argc, char *const *argv)
  parse the command line args (argc, argv).
- `int parse (char *const str, char *const p)
  parse a string of options (typically given from the environment).
- `int enroll (const char *const opt, const OptType t, const char *const desc, const char *const val)
  Add an option to the list of valid command options.
- `const char * retrieve (const char *const opt) const
  Retrieve value of option.
- `void usage (std::ostream &outfile=Cout) const
  Print usage information to outfile.
- `void usage (const char *str)
Private Member Functions

- char * basename (char *const p) const
  extract the base name from a string as delimited by '/'
- int setcell (Cell *c, char *valtoken, char *nexttoken, const char *p)
  internal convenience function for setting Cell::value

Private Attributes

- Cell * table
  option table
- const char * ustring
  usage message
- char * pname
  program basename
- char optmarker
  option marker
- int enroll_done
  finished enrolling
- Cell * last
  last entry in option table

13.76.1 Detailed Description

GetLongOpt is a general command line utility from S. Manoharan (Advanced Computer Research Institute, Lyon, France).

GetLongOpt manages the definition and parsing of "long options." Command line options can be abbreviated as long as there is no ambiguity. If an option requires a value, the value should be separated from the option either by whitespace or an "=".

13.76.2 Member Enumeration Documentation

enum OptType

enum for different types of values associated with command line options.

Enumerator

Valueless  option that may never have a value
OptionalValue  option with optional value
MandatoryValue  option with required value
13.76.3 Constructor & Destructor Documentation

**GetLongOpt ( const char optmark = '-' )**

Constructor.

Constructor for `GetLongOpt` takes an optional argument: the option marker. If unspecified, this defaults to `-`, the standard (?) Unix option marker.

13.76.4 Member Function Documentation

**int parse ( int argc, char **const argv )**

parse the command line args (argc, argv).

A return value < 1 represents a parse error. Appropriate error messages are printed when errors are seen. parse returns the the optind (see `getopt(3)`) if parsing is successful.

Referenced by `CommandLineHandler::check_usage()`.

**int parse ( char *const str, char *const p )**

parse a string of options (typically given from the environment).

A return value < 1 represents a parse error. Appropriate error messages are printed when errors are seen. parse takes two strings: the first one is the string to be parsed and the second one is a string to be prefixed to the parse errors.

**int enroll ( const char *const opt, const OptType t, const char *const desc, const char *const val )**

Add an option to the list of valid command options.

enroll adds option specifications to its internal database. The first argument is the option string. The second is an enum saying if the option is a flag (Valueless), if it requires a mandatory value (MandatoryValue) or if it takes an optional value (OptionalValue). The third argument is a string giving a brief description of the option. This description will be used by `GetLongOpt::usage`. `GetLongOpt`, for usage-printing, uses `{ $val }` to represent values needed by the options. `{ <$val> }` is a mandatory value and `{ [$val] }` is an optional value. The final argument to enroll is the default string to be returned if the option is not specified. For flags (options with Valueless), use "" (empty string, or in fact any arbitrary string) for specifying TRUE and 0 (null pointer) to specify FALSE.

References `GetLongOpt::enroll_done`, `GetLongOpt::optmarker`, `GetLongOpt::table`.

Referenced by `CommandLineHandler::initialize_options()`.

**const char * retrieve ( const char *const opt ) const**

Retrieve value of option.

The values of the options that are enrolled in the database can be retrieved using retrieve. This returns a string and this string should be converted to whatever type you want. See atoi, atof, atol, etc. If a "parse" is not done before retrieving all you will get are the default values you gave while enrolling! Ambiguities while retrieving (may happen when options are abbreviated) are resolved by taking the matching option that was enrolled last. For example, -{v} will expand to {-verify}. If you try to retrieve something you didn’t enroll, you will get a warning message.
References GetLongOpt::optmarker, and GetLongOpt::table.
Referenced by CommandLineHandler::check_usage(), ProgramOptions::manage_run_modes(), ProgramOptions-::ProgramOptions(), and CommandLineHandler::read_restart_evals().

```c
void usage ( const char ∗ str ) [inline]
```
Change header of usage output to str.

GetLongOpt::usage is overloaded. If passed a string "str", it sets the internal usage string to "str". Otherwise it simply prints the command usage.

References GetLongOpt::ustring.
The documentation for this class was generated from the following files:

- CommandLineHandler.hpp
- CommandLineHandler.cpp

### 13.77 Graphics Class Reference

The **Graphics** class provides a single interface to 2D (motif) and 3D (PLPLOT) graphics; there is only one instance of this **OutputManager::dakotaGraphics**.

#### Public Member Functions

- **Graphics ()**
  
  constructor

- **∼Graphics ()**
  
  destructor

- **void create_plots_2d (const Variables &vars, const Response &response)**
  
  creates the 2d graphics window and initializes the plots

- **void add_datapoint (int graphics_cntr, const Variables &vars, const Response &response)**
  
  adds data to each window in the 2d graphics based on the results of a model evaluation

- **void add_datapoint (int i, double x, double y)**
  
  adds data to a single window in the 2d graphics

- **void new_dataset (int i)**
  
  creates a separate line graphic for subsequent data points for a single window in the 2d graphics

- **void close ()**
  
  close graphics windows

- **void set_x_labels2d (const char ∗x_label)**
  
  set x label for each plot equal to x_label

- **void set_y_labels2d (const char ∗y_label)**
  
  set y label for each plot equal to y_label

- **void set_x_label2d (int i, const char ∗x_label)**
  
  set x label for ith plot equal to x_label

- **void set_y_label2d (int i, const char ∗y_label)**
  
  set y label for ith plot equal to y_label

Private Attributes

- Graphics2D * graphics2D
  pointer to the 2D graphics object
- bool win2dOn
  flag to indicate if 2D graphics window is active

13.77.1 Detailed Description

The Graphics class provides a single interface to 2D (motif) and 3D (PLPLOT) graphics; there is only one instance of this OutputManager::dakotaGraphics.

13.77.2 Member Function Documentation

void create_plots_2d ( const Variables & vars, const Response & response )

creates the 2d graphics window and initializes the plots

Sets up a single event loop for duration of the dakotaGraphics object, continuously adding data to a single window. There is no reset. To start over with a new data set, you need a new object (delete old and instantiate new).

References Variables::continuous_variable_labels(), Variables::cv(), Variables::discrete_int_variable_labels(), Variables::discrete_real_variable_labels(), Variables::div(), Variables::drv(), Response::function_labels(), Graphics::graphics2D, Response::num_functions(), Dakota::re_match(), and Graphics::win2dOn.

Referenced by SurrBasedMinimizer::initialize_graphics(), NonDReliability::initialize_graphics(), and Iterator::initialize_graphics().

void add_datapoint ( int graphics_cntr, const Variables & vars, const Response & response )

adds data to each window in the 2d graphics based on the results of a model evaluation

Adds data to each 2d plot and each tabular data column (one for each active variable and for each response function). graphicsCntr is used for the x axis in the graphics and the first column in the tabular data.

References Response::active_set_request_vector(), Variables::continuous_variables(), Variables::discrete_int_variables(), Variables::discrete_real_variables(), Response::function_values(), Graphics::graphics2D, and Graphics::win2dOn.

Referenced by OutputManager::add_datapoint(), NonDLocalReliability::mean_value(), and NonDLocalReliability::update_level_data().

void add_datapoint ( int i, double x, double y )

adds data to a single window in the 2d graphics

Adds data to a single 2d plot. Allows complete flexibility in defining other kinds of x-y plotting in the 2D graphics.

References Graphics::graphics2D, and Graphics::win2dOn.

void new_dataset ( int i )

creates a separate line graphic for subsequent data points for a single window in the 2d graphics

Used for displaying multiple data sets within the same plot.

References Graphics::graphics2D, and Graphics::win2dOn.

Referenced by NonDLocalReliability::update_level_data().

The documentation for this class was generated from the following files:
13.78 GridApplicInterface Class Reference

Derived application interface class which spawns simulation codes using grid services such as Condor or Globus.

Inheritance diagram for GridApplicInterface:

```
Interface
   ApplicationInterface
      ProcessApplicInterface
         SysCallApplicInterface
            GridApplicInterface
```

**Public Member Functions**

- **GridApplicInterface** (const ProblemDescDB &problem_db)
  
  *constructor*

- **~GridApplicInterface** ()
  
  *destructor*

- **void derived_map** (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)
  
  *Called by map() and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.*

- **void derived_map_asynch** (const ParamResponsePair &pair)
  
  *Called by map() and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.*

- **void wait_local_evaluations** (PRPQueue &prp_queue)
  
  *For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.*

- **void test_local_evaluations** (PRPQueue &prp_queue)
  
  *Convenience function for common code between wait and nowait case.*

- **int synchronous_local_analysis** (int analysis_id)

**Protected Member Functions**

- **bool grid_file_test** (const String &root_file)
  
  *test file(s) for existence based on root_file name*
Protected Attributes

- IntSet idSet
  Set of function evaluation id’s for active asynchronous system call evaluations.
- IntShortMap failCountMap
  map linking function evaluation id’s to number of response read failures
- start_grid_computing_t start_grid_computing
  handle to dynamically linked start_grid_computing function
- perform_analysis_t perform_analysis
  handle to dynamically linked perform_analysis grid function
- get_jobs_completed_t get_jobs_completed
  handle to dynamically linked get_jobs_completed grid function
- stop_grid_computing_t stop_grid_computing
  handle to dynamically linked stop_grid_computing function

13.78.1 Detailed Description

Derived application interface class which spawns simulation codes using grid services such as Condor or Globus. This class is currently a modified copy of SysCallApplicInterface adapted for use with an external grid services library which was dynamically linked using dlopen() services.

13.78.2 Member Function Documentation

int synchronous_local_analysis ( int analysis_id ) [inline], [virtual]

This code provides the derived function used by ApplicationInterface::serve_analyses_synch(). TODO - allow local analyses?????

Reimplemented from ApplicationInterface.
References SysCallApplicInterface::spawn_analysis_to_shell().
The documentation for this class was generated from the following files:

- GridApplicInterface.hpp
- GridApplicInterface.cpp

13.79 HDF5IOHelper Class Reference

Public Member Functions

- HDF5IOHelper (const std::string &file_name, bool overwrite=false)
- template<typename T >
  void store_scalar (const std::string &dset_name, const T &val)
    Store scalar data to a data set.
- void store_scalar (const std::string &dset_name, const String &val)
  Store string scalar data to a data set.
- template<typename T >
  void store_vector (const std::string &dset_name, const std::vector<T> &array) const
    Store vector (1D) information to a dataset.
- `template<typename T>
  void store_vector (const std::string &dset_name, const Teuchos::SerialDenseVector<int, T> &vec)
  
  Store vector (1D) information to a dataset.

- `void store_vector (const std::string &dset_name, const StringMultiArrayConstView &vec)
  
  Store vector (1D) information to a dataset.

- `void store_vector (const std::string &dset_name, const SizetMultiArrayConstView &vec)
  
  Store vector (1D) information to a dataset.

- `template<typename T>
  void store_matrix (const std::string &dset_name, const Teuchos::SerialDenseMatrix<int, T> &matrix, const bool &transpose=false) const
  
  Store matrix (2D) information to a dataset.

- `template<typename T>
  void store_matrix (const std::string &dset_name, const std::vector<T> &buf, const int &num_cols, const bool &transpose=false) const
  
  Store matrix (2D) information to a dataset.

- `template<typename T>
  void store_matrix (const std::string &dset_name, const std::vector<String> &buf, const int &num_cols, const bool &transpose=false) const
  
  Store matrix (2D) information to a dataset.

- `template<typename T>
  void set_scalar (const String &dset_name, const T &data, const int &index)
  
  Set a scalar in a 1D dataset at index using its name.

- `template<typename T>
  void set_scalar (const String &dset_name, H5::DataSet &ds, const T &data, const int &index)
  
  Set a scalar in a 1D dataset at index using the dataset object.

- `void set_scalar (const String &dset_name, H5::DataSet &ds, const String &data, const int &index)
  
  Set a scalar in a 1D dataset at index using the dataset object.

- `template<typename T>
  void set_vector (const String &dset_name, const T &data, const int &index, const bool &row=true)
  
  Set a row or column in a 2D dataset at index using its name.

- `void set_vector (const String &dset_name, H5::DataSet &ds, const StringMultiArrayConstView &data, const int &index, const bool &row=true)
  
  Set a row or column of Strings in a 2D dataset at index using the dataset object.

- `void set_vector (const String &dset_name, H5::DataSet &ds, const std::vector<String> &data, const int &index, const bool &row=true)
  
  Set a row or column of Strings in a 2D dataset at index using the dataset object.

- `template<typename T>
  void set_vector (const String &dset_name, H5::DataSet &ds, const T &data, const int &index, const bool &row=true)
  
  Set a row or column in a 2D dataset at index using the dataset object.

- `template<typename T>
  void set_matrix (const String &dset_name, const Teuchos::SerialDenseMatrix<int, T> &data, const int &index, const bool &transpose=false)
  
  Set a matrix in a 3D dataset at the index into the 0th dimension by name. Dims of matrix must match those of the trailing dimensions of the dataset.
- template<typename T>
  void set_matrix (const String &dset_name, H5::DataSet &ds, const Teuchos::SerialDenseMatrix<int, T> &data, const int &index, const bool &transpose=false)

  Set a matrix in a 3D dataset at the index into the 0th dimension using a dataset object. Dims of matrix must match those of the trailing dimensions of the dataset.

- template<typename T>
  void set_vector_matrix (const String &dset_name, const std::vector<Teuchos::SerialDenseMatrix<int, T>> &data, const int &index, const bool &transpose=false)

  Set a 3D slab in a 4D dataset at the index into the 0th dimension by name. The length of the vector must match the 1st dimension of the dataset, and the dimensions of the matrices must all match the 2nd and 3rd dimensions.

- int append_empty (const String &dset_name)

  Append an empty "layer" to the 0th dimension and return its index.

- template<typename T>
  void append_scalar (const String &dset_name, const T &data)

  Append a scalar to a 1D dataset.

- void append_scalar (const String &dset_name, const String &data)

  Append a scalar to a 1D dataset.

- template<typename T>
  void append_vector (const String &dset_name, const T &data, const bool &row=true)

  Append a vector as a row or column to a 2D dataset.

- void append_vector (const String &dset_name, const std::vector<String> &data, const bool &row=true)

  Append a vector as a row or column to a 2D dataset.

- void append_vector (const String &dset_name, const StringMultiArrayConstView &data, const bool &row=true)

  Append a vector as a row or column to a 2D dataset.

- template<typename T>
  void append_matrix (const String &dset_name, const Teuchos::SerialDenseMatrix<int, T> &data, const bool &transpose=false)

  Append a SerialDenseMatrix to a 3D dataset. The dataset will be expanded along the 0th dimension. By default, the shape of the matrix, (nrows, ncols), must match the size of the 1st and 2nd dimensions of the dataset. For transpose=true, the reverse must be true.

- template<typename T>
  void append_vector_matrix (const String &dset_name, const std::vector<Teuchos::SerialDenseMatrix<int, T>> &data, const bool &transpose=false)

  Append a std::vector of SerialDenseMatrix's to a 4D dataset. The dataset will be expanded along the 0th dimension. By default, the size of the vector must equal the size of the 1st dimension of the dataset, and the shape of the SDMs (nrows, ncols), must match the sizes of the 2nd and 2nd dimensions of the dataset. For transpose=true, the reverse must be true of the SDMs.

- template<typename T>
  void read_scalar (const std::string &dset_name, T &val)

  Read scalar data from a dataset.
• **void read_scalar** (const std::string &dset_name, String &val)
  
  Read scalar data from a dataset.

• **template<typename T>**
  
  void **read_vector** (const std::string &dset_name, T &array) const
  
  Read vector (1D) information from a dataset.

• **void read_vector** (const std::string &dset_name, StringArray &array) const
  
  Read a vector of Strings from a dataset.

• **template<typename T>**
  
  void **read_matrix** (const std::string &dset_name, Teuchos::SerialDenseMatrix<int, T> &matrix, const bool &transpose=false) const
  
  Read matrix (2D) information from a dataset Currently this involves a wasteful copy to do the transpose and is intended only for purposes of testing.

• **template<typename T>**
  
  void **get_matrix** (const std::string &dset_name, Teuchos::SerialDenseMatrix<int, T> &matrix, const int &index, const bool &transpose=false) const
  
  Get the matrix (2D) at the index into the 0th dimension of the 3D dataset at dsetname. Currently this involves a wasteful copy to do the transpose and is intended only for purposes of testing.

• **template<typename T>**
  
  void **get_vector_matrix** (const std::string &dset_name, std::vector<Teuchos::SerialDenseMatrix<int, T>> &data, const int &index, const bool &transpose=false) const
  
  Read the 3D slice at the index into the 0th dimension of the 4D dataset at dsname. Currently this involves a wasteful copy to do the transpose and is intended only for purposes of testing.

• **void report_num_open** ()
  
  Report the number of open descriptors of each type: just for debugging.

• **void create_empty_dataset** (const String &dset_name, const IntArray &dims, ResultsOutputType stored_type, int chunk_size=0, const void *fill_val=NULL)
  
  Create an empty dataset. Setting the first element of dims to 0 makes the dataset unlimited in that dimension. DSs unlimited in other dimensions currently are unsupported.

• **void attach_scale** (const String &dset_name, const String &scale_name, const String &label, const int &dim) const
  
  attach a dimension scale to a dataset

• **template<typename T>**
  
  void **add_attribute** (const String &location, const String &label, const T &value)
  
  Add an attribute to a group or dataset.

• **void add_attribute** (const String &location, const String &label, const String &value)
  
  Add an attribute to a group or dataset.

• **bool exists** (const String location_name) const
  
  Does a group or dataset exist?

• **bool is_scale** (const H5::DataSet dset) const
  
  Is the dataset a dimensions scale?

• **H5::Group create_groups** (const std::string &name, bool includes_dset=true) const
  
  Create a group hierarchy (final token optionally a dataset name)

• **H5::DataSet create_dataset** (const H5::H5Location &loc, const std::string &name, const H5::DataType &type, const H5::DataSpace &space, const H5::DSetCreatPropList &create_plist=H5::DSetCreatPropList(), const H5::DSetAccPropList &access_plist=H5::DSetAccPropList()) const
Create a dataset with a custom CreatPropList.

- H5::Group `create_group` (const H5::H5Location &loc, const std::string &name) const
  Create a group.
- void `create_softlink` (const String &link_location, const String &source_location)
  Create a soft link.
- void `flush` () const
  Flush cache to file.

Public Attributes

- H5::LinkCreatPropList `linkCreatePL`
  Global link creation property list.
- H5::DSetCreatPropList `datasetCompactPL`
  Global DataSet creation property list for compact datasets.
- H5::DSetCreatPropList `datasetContiguousPL`
  Global DataSet creation property list for contiguous datasets.

Protected Member Functions

- template<typename T>
  H5::Attribute `create_attribute` (const String &location, const String &label, const T &data)
  create an attribute at the location and return it
- template<typename T>
  void `store_vector` (const String &dset_name, const T *data, const int &len) const
  Store vector data using a pointer to the first element and length.
- void `store_vector` (const String &dset_name, const String *data, const int &len) const
  Store vector of Strings using a pointer to the first element and length.

Protected Attributes

- std::string `fileName`
  Name of the HDF5 file.
- H5::H5File `h5File`
  HDF5 file object.
- std::map<String, H5::DataSet> `datasetCache`
  Cache open datasets that have unlimited dimension. This is an optimization to prevent eval-related datasets being repeatedly flushed and reopened, which is very costly.

13.79.1 Detailed Description

This helper class provides wrapper functions that perform low-level access operations in HDF5 databases.

Authors: J. Adam Stephens, Russell Hooper, Elliott Ridgway
13.79.2 Member Function Documentation

void set_scalar ( const String & dset_name, H5::DataSet & ds, const String & data, const int & index )

Set a scalar in a 1D dataset at index using the dataset object.
Set a scalar in a 1D dataset at index using an object.

void read_vector ( const std::string & dset_name, StringArray & array ) const

Read a vector of Strings from a dataset.
Read vector (1D) String information from a dataset.
References Dakota::abort_handler(), and Dakota::h5_mem_dtype().
The documentation for this class was generated from the following files:

- HDF5_IO.hpp
- HDF5_IO.cpp

13.80 HierarchSurrBasedLocalTraits Class Reference

Class for multilevel-multifidelity optimization algorithm.

13.80.1 Detailed Description

Class for multilevel-multifidelity optimization algorithm.

This minimizer uses SurrogateModel(s) to perform minimization leveraging multiple model forms and discretization levels. A version of TraitsBase specialized for multilevel-multifidelity minimizer.

The documentation for this class was generated from the following file:

- HierarchSurrBasedLocalMinimizer.hpp

13.81 HierarchSurrModel Class Reference

Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity).

Inheritance diagram for HierarchSurrModel:

```
Model
  SurrogateModel
  HierarchSurrModel
```

Public Member Functions

- HierarchSurrModel (ProblemDescDB &problem_db)
  constructor
- ~HierarchSurrModel ()
  destructor
- const unsigned short correction_mode () const
  return correctionMode
- void correction_mode (unsigned short corr_mode)
  set correctionMode

Protected Member Functions

- size_t qoi () const
  return number of unique response functions (managing any aggregations)
- DiscrepancyCorrection & discrepancy_correction ()
  return the DiscrepancyCorrection object used by SurrogateModels
- short correction_type ()
  return the correction type from the DiscrepancyCorrection object used by SurrogateModels
- void correction_type (short corr_type)
  set the correction type from the DiscrepancyCorrection object used by SurrogateModels
- bool initialize_mapping (ParLevLIter pl_iter)
  Perform any global updates prior to individual evaluate() calls.
• bool finalize_mapping ()
  
  restore state in preparation for next initialization

• void derived_evaluate (const ActiveSet & set)
  
  portion of evaluate() specific to HierarchSurrModel

• void derived_evaluate_nowait (const ActiveSet & set)
  
  portion of evaluate_nowait() specific to HierarchSurrModel

• const IntResponseMap & derived_synchronize ()
  
  portion of synchronize() specific to HierarchSurrModel

• const IntResponseMap & derived_synchronize_nowait ()
  
  portion of synchronize_nowait() specific to HierarchSurrModel

• Model & surrogate_model ()
  
  return the active low fidelity model

• void surrogate_model_key (unsigned short lf_model_index, unsigned short lf_soln_lev_index=USHRT_MAX)
  
  set the key identifying the active low fidelity model

• void surrogate_model_key (const UShortArray &lf_key)
  
  set the index pair identifying the active low fidelity model

• Model & truth_model ()
  
  return the active high fidelity model

• void truth_model_key (unsigned short hf_model_index, unsigned short hf_soln_lev_index=USHRT_MAX)
  
  set the key identifying the active high fidelity model

• void truth_model_key (const UShortArray &hf_key)
  
  set the index pair identifying the active high fidelity model

• UShortArrayPair fidelity_keys ()
  
  return pair of active low fidelity and high fidelity model keys

• void derived_subordinate_models (ModelList &ml, bool recurse_flag)
  
  return orderedModels and, optionally, their sub-model recursions

• void resize_from_subordinate_model (size_t depth=std::numeric_limits<size_t>::max())
  
  resize currentResponse if needed when one of the subordinate models has been resized

• void update_from_subordinate_model (size_t depth=std::numeric_limits<size_t>::max())
  
  update currentVariables using non-active data from the passed model (one of the ordered models)

• void primary_response_fn_weights (const RealVector &wts, bool recurse_flag=true)
  
  set the relative weightings for multiple objective functions or least squares terms and optionally recurses into LF/HF models

• void surrogate_response_mode (short mode)
  
  set responseMode and pass any bypass request on to the high fidelity model for any lower-level surrogate recursions

• void surrogate_function_indices (const IntSet &surr_fn_indices)
  
  (re)set the surrogate index set in SurrogateModel::surrogateFnIndices

• void build_approximation ()
  
  use the high fidelity model to compute the truth values needed for correction of the low fidelity model results

• void component_parallel_mode (short mode)
  
  update component parallel mode for supporting parallelism in the low ad high fidelity models

• IntIntPair estimate_partition_bounds (int max_eval_concurrency)
estimate the minimum and maximum partition sizes that can be utilized by this Model

void derived_init_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
set up parallel operations for the array of ordered model fidelities

void derived_init_serial ()
set up serial operations for the array of ordered model fidelities

void derived_set_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
set active parallel configuration within the current low and high fidelity models identified by \{low,high\} FidelityKey

void derived_free_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
deallocate communicator partitions for the HierarchSurrModel (request forwarded to the the array of ordered model fidelities)

void serve_run (ParLevLIter pl_iter, int max_eval_concurrency)
Service the low and high fidelity model job requests received from the master; completes when termination message received from stop_servers().

void stop_servers ()
Executed by the master to terminate the low and high fidelity model server operations when iteration on the HierarchSurrModel is complete.

void inactive_view (short view, bool recurse_flag=true)
update the Model’s inactive view based on higher level (nested) context and optionally recurse into

bool evaluation_cache (bool recurse_flag=true) const
if recurse_flag, return true if orderedModels evaluation cache usage

bool restart_file (bool recurse_flag=true) const
if recurse_flag, return true if orderedModels restart file usage

void set_evaluation_reference ()
set the evaluation counter reference points for the HierarchSurrModel (request forwarded to the low and high fidelity models)

void fine_grained_evaluation_counters ()
request fine-grained evaluation reporting within the low and high fidelity models

void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const
print the evaluation summary for the HierarchSurrModel (request forwarded to the low and high fidelity models)

void warm_start_flag (const bool flag)
set the warm start flag, including the orderedModels

Private Member Functions

void key_updates (unsigned short model_index, unsigned short soln_lev_index)
utility for propagating new key values

void check_model_interface_instance ()
update sameInterfaceInstance based on interface ids for models identified by current \{low,high\} FidelityKey

void init_model (Model &model)
update the passed model (one of the ordered models) with data that could change once per set of evaluations (e.g., an outer iterator execution), including active variable labels, inactive variable values/bounds/labels, and linear/nonlinear constraint coeffs/bounds

void update_model (Model &model)
update the passed model (one of the ordered models) with data that could change per function evaluation (active variable values/bounds)

- **void update_from_model (Model &model)**
  
  update currentVariables using non-active data from the passed model (one of the ordered models)

- **void derived_synchronize_sequential (IntResponseMap &hf_resp_map_rekey, IntResponseMap &lf_resp_map_rekey, bool block)**
  
  called from derived_synchronize() and derived_synchronize_nowait() to extract and rekey response maps using blocking or nonblocking synchronization on the LF and HF models

- **void derived_synchronize_competing ()**
  
  called from derived_synchronize() for case of distinct models/interfaces with competing LF/HF job queues

- **void derived_synchronize_combine (const IntResponseMap &hf_resp_map, IntResponseMap &lf_resp_map, IntResponseMap &combined_resp_map)**
  
  combine the HF and LF response maps into a combined response map

- **void derived_synchronize_combine_nowait (const IntResponseMap &hf_resp_map, IntResponseMap &lf_resp_map, IntResponseMap &combined_resp_map)**
  
  combine the available components from HF and LF response maps into a combined response map

- **void resize_response (bool use_virtual_counts=true)**
  
  resize currentResponse based on responseMode

- **void compute_apply_delta (IntResponseMap &lf_resp_map)**
  
  helper function used in the AUTO_CORRECTED_SURROGATE responseMode for computing a correction and applying it to lf_resp_map

- **void single_apply (const Variables &vars, Response &resp, const UShortArrayPair &keys)**
  
  helper function for applying a single deltaCorr correction corresponding to key

- **void recursive_apply (const Variables &vars, Response &resp)**
  
  helper function for applying a correction across a sequence of model forms or discretization levels

- **void stop_model (size_t ordered_model_index)**
  
  stop the servers for the orderedModels instance identified by the passed index

**Private Attributes**

- **DiscrepCorrMap deltaCorr**
  
  manages construction and application of correction functions that are applied to a surrogate model (DataFitSurr or HierarchSurr) in order to reproduce high fidelity data.

- **short corrOrder**
  
  order of correction: 0, 1, or 2

- **unsigned short correctionMode**
  
  vector to specify a sequence of discrepancy corrections to apply in AUTO_CORRECTED_SURROGATE mode

- **ModelArray orderedModels**
  
  Ordered sequence (low to high) of model fidelities. Models are of arbitrary type and supports recursions.

- **bool sameModelInstance**
  
  flag indicating that the {low,high}FidelityKey correspond to the same model instance, requiring modifications to updating and evaluation scheduling processes

- **bool sameInterfaceInstance**
flag indicating that the models identified by \{low,high\}FidelityKey employ the same interface instance, requiring modifications to evaluation scheduling processes

- UShortArray componentParallelKey
  store \{LF,HF\} model key that is active in component.parallel_mode()

- std::map< UShortArray, Response > truthResponseRef
  map of reference truth (high fidelity) responses computed in build_approximation() and used for calculating corrections

- IntResponseMap cachedTruthRespMap
  map of truth (high-fidelity) responses retrieved in derived_synchronize_nowait() that could not be returned since corresponding low-fidelity response portions were still pending

### Additional Inherited Members

#### 13.81.1 Detailed Description

Derived model class within the surrogate model branch for managing hierarchical surrogates (models of varying fidelity).

The HierarchSurrModel class manages hierarchical models of varying fidelity. The class contains an ordered array of model forms (fidelity ordered from low to high), where each model form may also contain a set of solution levels (space/time discretization, convergence tolerances, etc.). At run time, one of these combinations is activated as the low fidelity model and used to perform approximate function evaluations, while another of these combinations is activated as the high fidelity model and used to provide truth evaluations for computing corrections to the low fidelity results.

#### 13.81.2 Member Function Documentation

**bool initialize_mapping ( ParLevLIter pl_iter ) [protected], [virtual]**

Perform any global updates prior to individual evaluate() calls.

Inactive variables must be propagated when a HierarchSurrModel is employed by a sub-iterator (e.g., OUU with MLMC or MLPCE). In current use cases, this can occur once per sub-iterator execution within Model::initialize_mapping().

Reimplemented from Model.

References HierarchSurrModel::init_model(), SurrogateModel::initialize_mapping(), and HierarchSurrModel::orderedModels.

**bool finalize_mapping ( ) [protected], [virtual]**

restore state in preparation for next initialization

Inactive variables must be propagated when a HierarchSurrModel is employed by a sub-iterator (e.g., OUU with MLMC or MLPCE). In current use cases, this can occur once per sub-iterator execution within Model::initialize_mapping().

Reimplemented from Model.

References SurrogateModel::finalize_mapping(), and HierarchSurrModel::orderedModels.

**void derived_evaluate ( const ActiveSet & set ) [protected], [virtual]**

portion of evaluate() specific to HierarchSurrModel
CHAPTER 13. CLASS DOCUMENTATION

Compute the response synchronously using LF model, HF model, or both (mixed case). For the LF model portion, compute the high fidelity response if needed with build_approximation(), and, if correction is active, correct the low fidelity results.

Reimplemented from Model.

References Response::active_set(), SurrogateModel::aggregate_response(), SurrogateModel::approxBuilds, SurrogateModel::asv_split(), HierarchSurrModel::build_approximation(), HierarchSurrModel::component_parallel_mode(), Response::copy(), Model::current_response(), Model::currentResponse, Model::currentVariables, HierarchSurrModel::deltaCorr, ActiveSet::derivative_vector(), Model::eval_tag_prefix(), Model::evalTagPrefix, Model::evaluate(), HierarchSurrModel::fidelity_keys(), SurrogateModel::force_rebuild(), Model::hierarchicalTagging, Model::outputLevel, HierarchSurrModel::recursive_apply(), ActiveSet::request_vector(), SurrogateModel::response_combine(), SurrogateModel::responsemode, HierarchSurrModel::samesurrogateModelInstance, Model::solution_level_index(), SurrogateModel::surrModelEvalCntr, SurrogateModel::surr_response_level_index(), HierarchSurrModel::surr_model(), SurrogateModel::truth_level_index(), HierarchSurrModel::truth_model(), Response::update(), and HierarchSurrModel::update_model().

void derived_evaluate_nowait ( const ActiveSet & set ) [protected], [virtual]

portion of evaluate_nowait() specific to HierarchSurrModel

Compute the response asynchronously using LF model, HF model, or both (mixed case). For the LF model portion, compute the high fidelity response with build_approximation() (for correcting the low fidelity results in derived_synchronize() and derived_synchronize_nowait()) if not performed previously.

Reimplemented from Model.

References SurrogateModel::approxBuilds, SurrogateModel::asv_split(), Model::asynch_flag(), HierarchSurrModel::build_approximation(), SurrogateModel::cachedApproxRespMap, HierarchSurrModel::cachedTruthRespMap, HierarchSurrModel::component_parallel_mode(), Response::copy(), Variables::copy(), Model::current_response(), Model::currentVariables, ActiveSet::derivative_vector(), Model::eval_tag_prefix(), Model::evalTagPrefix, Model::evaluate(), Model::evaluate_nowait(), Model::evaluation_id(), SurrogateModel::force_rebuild(), Model::hierarchicalTagging, SurrogateModel::rawVarsMap, HierarchSurrModel::recursive_apply(), ActiveSet::request_vector(), SurrogateModel::responsemode, HierarchSurrModel::samesurrogateModelInstance, Model::solution_level_index(), SurrogateModel::surrIdMap, SurrogateModel::surrModelEvalCntr, SurrogateModel::surr_response_level_index(), HierarchSurrModel::surr_model(), SurrogateModel::truth_level_index(), HierarchSurrModel::truth_model(), SurrogateModel::truthIdMap, and HierarchSurrModel::update_model().

const IntResponseMap & derived_synchronize ( ) [protected], [virtual]

portion of synchronize() specific to HierarchSurrModel

Blocking retrieval of asynchronous evaluations from LF model, HF model, or both (mixed case). For the LF model portion, apply correction (if active) to each response in the array. derived_synchronize() is designed for the general case where derived_evaluate_nowait() may be inconsistent in its use of low fidelity evaluations, high fidelity evaluations, or both.

Reimplemented from Model.

References HierarchSurrModel::derived_synchronize_combine(), HierarchSurrModel::derived_synchronize_competing(), HierarchSurrModel::derived_synchronize_sequential(), HierarchSurrModel::sameInterfaceInstance, HierarchSurrModel::sameModelInstance, SurrogateModel::surrIdMap, SurrogateModel::surrResponseMap, and SurrogateModel::truthIdMap.

const IntResponseMap & derived_synchronize_nowait ( ) [protected], [virtual]

portion of synchronize_nowait() specific to HierarchSurrModel
Nonblocking retrieval of asynchronous evaluations from LF model, HF model, or both (mixed case). For the LF model portion, apply correction (if active) to each response in the map. `derived_synchronize_nowait()` is designed for the general case where `derived_evaluate_nowait()` may be inconsistent in its use of actual evals, approx evals, or both.

Reimplemented from `Model`.

References `HierarchSurrModel::derived_synchronize_combine_nowait()`, `HierarchSurrModel::derived_synchronize_sequential()`, and `SurrogateModel::surrResponseMap`.

Referenced by `HierarchSurrModel::derived_synchronize_competing()`.

- `Interface operator= (const Interface &interface_in)`
  
  *assignment operator*
• virtual void \texttt{map} \((\text{const Variables &vars, const ActiveSet &set, Response &response, bool async\_flag=false})\)
  
  \textit{the function evaluator: provides a "mapping" from the variables to the responses.}

• virtual const IntResponseMap & \texttt{synchronize ()}
  
  \textit{recovers data from a series of asynchronous evaluations (blocking)}

• virtual const IntResponseMap & \texttt{synchronize\_nowait ()}
  
  \textit{recovers data from a series of asynchronous evaluations (nonblocking)}

• virtual void \texttt{serve\_evaluations ()}
  
  \textit{evaluation server function for multiprocessor executions}

• virtual void \texttt{stop\_evaluation\_servers ()}
  
  \textit{send messages from iterator rank 0 to terminate evaluation servers}

• virtual void \texttt{init\_communicators (const IntArray &message\_lengths, int max\_eval\_concurrency)}
  
  \textit{allocate communicator partitions for concurrent evaluations within an iterator and concurrent multiprocessor analyses within an evaluation.}

• virtual void \texttt{set\_communicators (const IntArray &message\_lengths, int max\_eval\_concurrency)}
  
  \textit{set the local parallel partition data for an interface (the partitions are already allocated in ParallelLibrary).}

• virtual void \texttt{init\_serial ()}
  
  \textit{reset certain defaults for serial interface objects.}

• virtual int \texttt{async\_local\_evaluation\_concurrency () const}
  
  \textit{return the user-specified concurrency for async local evaluations}

• virtual short \texttt{interface\_synchronization () const}
  
  \textit{return the user-specified interface synchronization}

• virtual int \texttt{minimum\_points (bool constraint\_flag) const}
  
  \textit{returns the minimum number of points required to build a particular ApproximationInterface (used by DataFitSurfModels).}

• virtual int \texttt{recommended\_points (bool constraint\_flag) const}
  
  \textit{returns the recommended number of points required to build a particular ApproximationInterface (used by DataFitSurfModels).}

• virtual void \texttt{active\_model\_key (const UShortArray &mi\_key)}
  
  \textit{activate an approximation state based on its multi-index key}

• virtual void \texttt{clear\_model\_keys ()}
  
  \textit{reset initial state by removing all model keys for an approximation}

• virtual void \texttt{surrogate\_model\_key (const UShortArray &key)}
  
  \textit{assign key for the surrogate model within a \{truth,surrogate\} pairing}

• virtual void \texttt{truth\_model\_key (const UShortArray &key)}
  
  \textit{assign key for the truth model within a \{truth,surrogate\} pairing}

• virtual void \texttt{approximation\_function\_indices (const IntSet &approx\_fn\_indices)}
  
  \textit{set the (currently active) approximation function index set}

• virtual void \texttt{link\_multilevel\_approximation\_data ()}
  
  \textit{link together more than one SurrogateData instance within an ApproximationInterface}

• virtual void \texttt{update\_approximation (const Variables &vars, const IntResponsePair &response\_pr)}
  
  \textit{updates the anchor point for an approximation}

• virtual void \texttt{update\_approximation (const RealMatrix &samples, const IntResponseMap &resp\_map)}
  
  \textit{updates the current data points for an approximation}

• virtual void \texttt{update\_approximation (const VariablesArray &vars\_array, const IntResponseMap &resp\_map)}
void append_approximation (const Variables &vars, const IntResponsePair &response_pr)
  appends a single point to an existing approximation
virtual void append_approximation (const RealMatrix &samples, const IntResponseMap &resp_map)
  appends multiple points to an existing approximation
virtual void append_approximation (const VariablesArray &vars_array, const IntResponseMap &resp_map)
  appends multiple points to an existing approximation
virtual void build_approximation (const RealVector &c_l_bnds, const RealVector &c_u_bnds, const IntVector &di_l_bnds, const IntVector &di_u_bnds, const RealVector &dr_l_bnds, const RealVector &dr_u_bnds)
  builds the approximation
virtual void export_approximation ()
  export the approximation to disk
virtual void rebuild_approximation (const BoolDeque &rebuild_deque)
  rebuilds the approximation after a data update
virtual void pop_approximation (bool save_data)
  removes data from last append from the approximation
virtual void push_approximation ()
  retrieves approximation data from a previous state (negates pop)
virtual bool push_available ()
  queries the approximation for the ability to retrieve a previous increment
virtual void finalize_approximation ()
  finalizes the approximation by applying all trial increments
virtual void combine_approximation ()
  combine the current approximation with previously stored data sets
virtual void combined_to_active (bool clear_combined=true)
  promote the combined approximation to the currently active one
virtual void clear_inactive ()
  clear inactive approximation data
virtual Real2DArray cv_diagnostics (const StringArray &metric_types, unsigned num_folds)
  approximation cross-validation quality metrics per response function
virtual RealArray challenge_diagnostics (const String &metric_type, const RealMatrix &challenge_pts)
  approximation challenge data metrics per response function
virtual void clear_current_active_data ()
  clears current data from an approximation interface
virtual void clear_active_data ()
  clears all data from an approximation interface
virtual SharedApproxData & shared_approximation ()
  retrieve the SharedApproxData within an ApproximationInterface
virtual std::vector<Approximation> & approximations ()
  retrieve the Approximations within an ApproximationInterface
virtual const Pecos::SurrogateData & approximation_data (size_t fn_index, size_t d_index=NPOS)
CHAPTER 13. CLASS DOCUMENTATION

- retrieve the approximation data from a particular Approximation within an ApproximationInterface
  - virtual const RealVectorArray & approximation_coefficients (bool normalized=false)
    retrieve the approximation coefficients from each Approximation within an ApproximationInterface
  - virtual void approximation_coefficients (const RealVectorArray &approx_coeffs, bool normalized=false)
    set the approximation coefficients within each Approximation within an ApproximationInterface
  - virtual const RealVector & approximation_variances (const Variables &vars)
    retrieve the approximation variances from each Approximation within an ApproximationInterface
  - virtual const StringArray & analysis_drivers () const
    retrieve the analysis drivers specification for application interfaces
  - virtual const String2DArray & analysis_components () const
    retrieve the analysis components, if available
  - virtual bool evaluation_cache () const
    return flag indicating usage of the global evaluation cache
  - virtual bool restart_file () const
    return flag indicating usage of the restart file
  - virtual void file_cleanup () const
    clean up any interface parameter/response files when aborting
  - void cache_unmatched_response (int raw_id)
    migrate an unmatched response record from rawResponseMap to cachedResponseMap
  - void assign_rep (Interface *interface_rep, bool ref_count_incr=true)
    assign letter or replace existing letter with a new one
  - unsigned short interface_type () const
    returns the interface type
  - const String & interface_id () const
    returns the interface identifier
  - int evaluation_id () const
    returns the value of the (total) evaluation id counter for the interface
  - void fine_grained_evaluation_counters (size_t num_fns)
    set fineGrainEvalCounters to true and initialize counters if needed
  - void init_evaluation_counters (size_t num_fns)
    initialize fine grained evaluation counters, sizing if needed
  - void set_evaluation_reference ()
    set evaluation count reference points for the interface
  - void print_evaluation_summary (std::ostream &s, bool minimal_header, bool relative_count) const
    print an evaluation summary for the interface
  - bool multi_proc_eval () const
    returns a flag signaling the use of multiprocessor evaluation partitions
  - bool iterator_eval_dedicated_master () const
    returns a flag signaling the use of a dedicated master processor at the iterator-evaluation scheduling level
  - bool is_null () const
    function to check interfaceRep (does this envelope contain a letter?)
  - void eval_tag_prefix (const String &eval_id_str, bool append_iface_id=true)
    set the evaluation tag prefix (does not recurse)
Protected Member Functions

- Interface (BaseConstructor, const ProblemDescDB &problem_db)
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- Interface (NoDBBaseConstructor, size_t num_fns, short output_level)
  constructor initializes the base class part of letter classes (NoDBBaseConstructor used for on the fly instantiations without a DB)

- void init_algebraic_mappings (const Variables &vars, const Response &response)
  Define algebraicACVIndices, algebraicACVIds, and algebraicFnIndices.

- void asv_mapping (const ActiveSet &total_set, ActiveSet &algebraic_set, ActiveSet &core_set)
  define the evaluation requirements for algebraic_mappings() (algebraic_set) and the core Application/Approximation mapping (core_set) from the total Interface evaluation requirements (total_set)

- void asv_mapping (const ActiveSet &algebraic_set, ActiveSet &total_set)
  map an algebraic ASV back to original total ordering for asynch recovery

- void algebraic_mappings (const Variables &vars, const ActiveSet &algebraic_set, Response &algebraic_response)
  evaluate the algebraic_response using the AMPL solver library and the data extracted from the algebraic_mappings file

- void response_mapping (const Response &algebraic_response, const Response &core_response, Response &total_response)
  combine the response from algebraic_mappings() with the response from derived_map() to create the total response

- String final_eval_id_tag (int fn_eval_id)
  form and return the final evaluation ID tag, appending iface ID if needed

Protected Attributes

- unsigned short interfaceType
  the interface type: enum for system, fork, direct, grid, or approximation

- String interfaceId
  the interface specification identifier string from the DAKOTA input file

- bool algebraicMappings
  flag for the presence of algebraic_mappings that define the subset of an Interface’s parameter to response mapping that is explicit and algebraic.

- bool coreMappings
  flag for the presence of non-algebraic mappings that define the core of an Interface’s parameter to response mapping (using analysis_drivers for ApplicationInterface or functionSurfaces for ApproximationInterface).

- short outputLevel
  output verbosity level: {SILENT, QUIET, NORMAL, VERBOSE, DEBUG}_OUTPUT

- int currEvalId
  identifier for the current evaluation, which may differ from the evaluation counters in the case of evaluation scheduling: used on iterator master as well as server processors. Currently, this is set prior to all invocations of derived_map() for all processors.

- bool fineGrainEvalCounters
  controls use of fn val/grad/hess counters for detailed evaluation report

- int evalIdCntx
CHAPTER 13. CLASS DOCUMENTATION

- **total interface evaluation counter**
  - `int newEvalIdCntr`
    - new (non-duplicate) interface evaluation counter
  - `int evalIdRefPt`
    - iteration reference point for evalIdCntr
  - `int newEvalIdRefPt`
    - iteration reference point for newEvalIdCntr
- **IntArray fnValCounter**
  - number of value evaluations by resp fn
  - Set of responses returned by either a blocking or nonblocking schedule.
  - `IntArray fnGradCounter`
    - number of gradient evaluations by resp fn
  - `IntArray fnHessCounter`
    - number of Hessian evaluations by resp fn
- **IntArray newFnValCounter**
  - number of new value evaluations by resp fn
  - `IntArray newFnGradCounter`
    - number of new gradient evaluations by resp fn
  - `IntArray newFnHessCounter`
    - number of new Hessian evaluations by resp fn
- **IntArray fnValRefPt**
  - iteration reference point for fnValCounter
  - `IntArray fnGradRefPt`
    - iteration reference point for fnGradCounter
  - `IntArray fnHessRefPt`
    - iteration reference point for fnHessCounter
  - `IntArray newFnValRefPt`
    - iteration reference point for newFnValCounter
  - `IntArray newFnGradRefPt`
    - iteration reference point for newFnGradCounter
  - `IntArray newFnHessRefPt`
    - iteration reference point for newFnHessCounter
- **IntResponseMap rawResponseMap**
  - Set of available asynchronous responses completed within a blocking or nonblocking scheduler that cannot be processed in a higher level context and need to be stored for later.
- **IntResponseMap cachedResponseMap**
  - `StringBuilder fnLabels`
    - response function descriptors (used in `print_evaluation_summary()`) and derived direct interface classes; initialized in `map()` functions due to potential updates after construction
- **bool multiProcEvalFlag**
  - flag for multiprocessor evaluation partitions (evalComm)
- **bool ieDedMasterFlag**
  - flag for dedicated master partitioning at the iterator level
• String `evalTagPrefix`
  set of period-delimited evaluation ID tags to use in evaluation tagging

• bool `appendInterfaceId`
  whether to append the interface ID to the prefix during map (default true)

• String2DArray `analysisComponents`
  Analysis components for interface types that support them.

Private Member Functions

• `Interface * get_interface (ProblemDescDB &problem_db)`
  Used by the envelope to instantiate the correct letter class.

• int `algebraic_function_type (String)`
  Used by algebraic mappings to determine the correct AMPL function evaluation call to make.

Static Private Member Functions

• static String `user_auto_id ()`
  return the next available interface ID for no-ID user methods

• static String `no_spec_id ()`
  return the next available interface ID for on-the-fly methods

Private Attributes

• StringArray `algebraicVarTags`
  set of variable tags from AMPL stub.col

• SizetArray `algebraicACVIndices`
  set of indices mapping AMPL algebraic variables to DAKOTA all continuous variables

• SizetArray `algebraicACVIds`
  set of ids mapping AMPL algebraic variables to DAKOTA all continuous variables

• StringArray `algebraicFnTags`
  set of function tags from AMPL stub.row

• IntArray `algebraicFnTypes`
  function type: > 0 = objective, < 0 = constraint |value|-1 is the objective (constraint) index when making AMPL objval (conival) calls

• SizetArray `algebraicFnIndices`
  set of indices mapping AMPL algebraic objective functions to DAKOTA response functions

• RealArray `algebraicConstraintWeights`
  set of weights for computing Hessian matrices for algebraic constraints;

• int `numAlgebraicResponses`
  number of algebraic responses (objectives+constraints)

• Interface * `interfaceRep`
  pointer to the letter (initialized only for the envelope)

• int `referenceCount`
  number of objects sharing interfaceRep

• ASL * `asl`
  pointer to an AMPL solver library (ASL) object
Static Private Attributes
- static size_t noSpecIdNum = 0
  the last used interface ID number for on-the-fly instantiations (increment before each use)

13.82.1 Detailed Description
Base class for the interface class hierarchy.

The Interface class hierarchy provides the part of a Model that is responsible for mapping a set of Variables into a set of Responses. The mapping is performed using either a simulation-based application interface or a surrogate-based approximation interface. For memory efficiency and enhanced polymorphism, the interface hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Interface) serves as the envelope and one of the derived classes (selected in Interface::get_interface()) serves as the letter.

13.82.2 Constructor & Destructor Documentation

Interface ( )
default constructor
  used in Model envelope class instantiations

Interface ( ProblemDescDB & problem_db )
standard constructor for envelope
  Used in Model instantiation to build the envelope. This constructor only needs to extract enough data to properly execute get_interface, since Interface::Interface(BaseConstructor, problem_db) builds the actual base class data inherited by the derived interfaces.
  References Dakota::abort_handler(), Interface::get_interface(), and Interface::interfaceRep.

Interface ( const Interface & interface_in )
copy constructor
  Copy constructor manages sharing of interfaceRep and incrementing of referenceCount.
  References Interface::interfaceRep, and Interface::referenceCount.

~Interface ( ) [virtual]
destructor
  Destructor decrements referenceCount and only deletes interfaceRep if referenceCount is zero.
  References Interface::interfaceRep, and Interface::referenceCount.

Interface ( BaseConstructor, const ProblemDescDB & problem_db ) [protected]
constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
  This constructor is the one which must build the base class data for all inherited interfaces. get_interface() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_interface() again). Since this is the letter and the letter IS the representation, interfaceRep is set to NULL (an uninitialized pointer causes problems in ~Interface).
References Dakota::abort_handler(), Interface::algebraic_function_type(), Interface::algebraicConstraintWeights, Interface::algebraicFnTags, Interface::algebraicFnTypes, Interface::algebraicMappings, Interface::algebraicVarTags, Interface::asl, ProblemDescDB::get_string(), Interface::interfaceId, Interface::outputLevel, Dakota::strends(), and Interface::user_auto_id().

13.82.3 Member Function Documentation

**Interface operator= ( const Interface & interface_in )**

References Interface::interfaceRep, and Interface::referenceCount.

```cpp
generic

void assign_rep ( Interface * interface_rep, bool ref_count_incr = true )
```

Assign letter or replace existing letter with a new one

Similar to the assignment operator, the assign_rep() function decrements referenceCount for the old interfaceRep and assigns the new interfaceRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref_count_incr:

- ref_count_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.
- ref_count_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after get_interface(): a letter is dynamically allocated using new and passed into assign_rep, the letter’s reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

References Dakota::abort_handler(), Interface::interfaceRep, and Interface::referenceCount.

Referenced by DataFitSurrModel::DataFitSurrModel(), parallel_interface_plugin(), LibraryEnvironment::plugin_interface(), and run_dakota().

```cpp
generic

void eval_tag_prefix ( const String & eval_id_str, bool append_iface_id = true )
```

Set the evaluation tag prefix (does not recurse)

Default implementation just sets the list of eval ID tags; derived classes containing additional models or interfaces should override (currently no use cases)

References Interface::append_ifaceId, Interface::eval_tag_prefix(), Interface::evalTagPrefix, and Interface::interfaceRep.

Referenced by NestedModel::derived_evaluate(), SimulationModel::eval_tag_prefix(), and Interface::eval_tag_prefix().

```cpp
generic

void response_mapping ( const Response & algebraic_response, const Response & core_response, Response & total_response ) [protected]
```

Combine the response from algebraic_mappings() with the response from derived_map() to create the total response

This function will get invoked even when only algebraic mappings are active (no core mappings from derived_map), since the AMPL algebraic_response may be ordered differently from the total_response. In this case, the core_response object is unused.
CHAPTER 13. CLASS DOCUMENTATION

References Dakota::NPOS, Dakota::abort_handler(), Response::active_set_derivative_vector(), Response::active_set_request_vector(), Interface::algebraicACVIds, Interface::algebraicFnIndices, Interface::coreMappings, Dakota::find_index(), Response::function_gradient(), Response::function_gradient_view(), Response::function_gradients(), Response::function_hessian(), Response::function_hessian_view(), Response::function_hessians(), Response::function_value(), Response::function_values(), Response::function_values_view(), Interface::outputLevel, Response::reset(), and Response::reset_inactive().

Referenced by ApproximationInterface::map(), ApplicationInterface::map(), ApplicationInterface::synchronize(), and ApplicationInterface::synchronize_nowait().

Interface * get_interface ( ProblemDescDB & problem_db ) [private]

Used by the envelope to instantiate the correct letter class.

used only by the envelope constructor to initialize interfaceRep to the appropriate derived type.

References ProblemDescDB::get_string(), ProblemDescDB::get_ushort(), and Interface::interface_type().

Referenced by Interface::Interface().

String user_auto_id ( ) [static], [private]

return the next available interface ID for no-ID user methods

Rationale: The parser allows multiple user-specified interfaces with empty (unspecified) ID. However, only a single Interface with empty ID can be constructed (if it’s the only one present, or the "last one parsed"). Therefore decided to prefer NO_ID over NO_ID_<num> for consistency with interface NO_ID convention. Additionally, NO_ID is preferred over NO_INTERFACE_ID (contrast with Iterator and Model) to preserve backward compatibility

Referenced by Interface::Interface().

String no_spec_id ( ) [static], [private]

return the next available interface ID for on-the-fly methods

Rationale: For now NOSPEC_ID is chosen due to historical id="NO_SPECIFICATION” used for internally-constructed Iterators. Longer-term, consider auto-generating an ID that includes the context from which the method is constructed, e.g., the parent method or model’s ID, together with its name.

References Interface::noSpecIdNum.

13.82.4 Member Data Documentation

IntResponseMap rawResponseMap [protected]

Set of responses returned by either a blocking or nonblocking schedule.

The map is a full/partial set of completions which are identified through their evalIdCntr key. The raw set is postprocessed (i.e., finite diff grads merged) in Model::synchronize() where it becomes responseMap.

Referenced by ApplicationInterface::asynchronous_local_evaluations(), Interface::cache_unmatched_response(), ApplicationInterface::process_asynch_local(), ApplicationInterface::process_synch_local(), ApplicationInterface::receive_evaluation(), ApplicationInterface::synchronize(), ApproximationInterface::synchronize(), Application- Interface::synchronize_nowait(), ApproximationInterface::synchronize_nowait(), ApplicationInterface::test_local_backfill(), and ApplicationInterface::test_receives_backfill().

The documentation for this class was generated from the following files:

- DakotaInterface.hpp
- DakotaInterface.cpp
13.83 Iterator Class Reference

Base class for the iterator class hierarchy.

Inheritance diagram for Iterator:

```

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

- virtual void **core_run** ()
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

- virtual void **post_run** (std::ostream &s)
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/-Responses and perform final analysis phase in a standalone way

- virtual void **finalize_run** ()
  utility function to perform common operations following post_run(); deallocation and resetting of instance pointers

- virtual void **pre_output** ()
  write variables to file, following pre-run

- virtual void **post_input** ()
  read tabular data for post-run mode

- virtual void **reset** ()
  restore initial state for repeated sub-iterator executions

- virtual void **initialize_iterator** (int job_index)
  used by IteratorScheduler to set the starting data for a run

- virtual void **pack_parameters_buffer** (MPIPackBuffer &send_buffer, int job_index)
  used by IteratorScheduler to pack starting data for an iterator run

- virtual void **unpack_parameters_buffer** (MPIUnpackBuffer &recv_buffer, int job_index)
  used by IteratorScheduler to unpack starting data for an iterator run

- virtual void **unpack_parameters_initialize** (MPIUnpackBuffer &recv_buffer, int job_index)
  used by IteratorScheduler to unpack starting data and initialize an iterator run

- virtual void **pack_results_buffer** (MPIPackBuffer &send_buffer, int job_index)
  used by IteratorScheduler to pack results data from an iterator run

- virtual void **unpack_results_buffer** (MPIUnpackBuffer &recv_buffer, int job_index)
  used by IteratorScheduler to unpack results data from an iterator run

- virtual void **update_local_results** (int job_index)
  used by IteratorScheduler to update local results arrays

- virtual const **Variables & variables_results** () const
  return a single final iterator solution (variables)

- virtual const **Response & response_results** () const
  return a single final iterator solution (response)

- virtual const **VariablesArray & variables_array_results** ()
  return multiple final iterator solutions (variables). This should only be used if returns_multiple_points() returns true.

- virtual const **ResponseArray & response_array_results** ()
  return multiple final iterator solutions (response). This should only be used if returns_multiple_points() returns true.

- virtual void **response_results_active_set** (const ActiveSet &set)
  set the requested data for the final iterator response results

- virtual const **RealVector & response_error_estimates** () const
  return error estimates associated with the final iterator solution

- virtual bool **accepts_multiple_points** () const
  indicates if this iterator accepts multiple initial points. Default return is false. Override to return true if appropriate.
virtual bool returns_multiple_points () const
    
    indicates if this iterator returns multiple final points. Default return is false. Override to return true if appropriate.

virtual void initial_points (const VariablesArray &pts)
    
    sets the multiple initial points for this iterator. This should only be used if accepts_multiple_points() returns true.

virtual void initialize_graphics (int iterator_server_id=1)
    
    initialize the 2D graphics window and the tabular graphics data

virtual void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
    
    print the final iterator results

virtual const Model & algorithm_space_model () const
    
    return the result of any recasting or surrogate model recursion layered on top of iteratedModel by the derived Iterator ctor chain

virtual unsigned short uses_method () const
    
    return name of any enabling iterator used by this iterator

virtual void method_recourse ()
    
    perform a method switch, if possible, due to a detected conflict

virtual const VariablesArray & all_variables ()
    
    return the complete set of evaluated variables

virtual const RealMatrix & all_samples ()
    
    return the complete set of evaluated samples

virtual const IntResponseMap & all_responses () const
    
    return the complete set of computed responses

virtual int num_samples () const
    
    get the current number of samples

virtual void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)
    
    reset sampling iterator to use at least min_samples

virtual void sampling_reference (int samples_ref)
    
    set reference number of samples, which is a lower bound during reset

virtual void sampling_increment ()
    
    increment to next in sequence of refinement samples

virtual unsigned short sampling_scheme () const
    
    return sampling name

virtual bool compact_mode () const
    
    returns Analyzer::compactMode

virtual IntIntPair estimate_partition_bounds ()
    
    estimate the minimum and maximum partition sizes that can be utilized by this Iterator

virtual bool resize ()
    
    reinitializes iterator based on new variable size

virtual void declare_sources ()
    
    Declare sources to the evaluations database.

void init_communicators (ParLevLIter pl_iter)
    
    initialize the communicators associated with this Iterator instance

void set_communicators (ParLevLIter pl_iter)
    
    set the communicators associated with this Iterator instance
• void free_communicators (ParLevLIter pl_iter)
  free the communicators associated with this Iterator instance
• void resize_communicators (ParLevLIter pl_iter, bool reinit_comms)
  Resize the communicators. This is called from the letter’s resize()
• void parallel_configuration_iterator (ParConfigLIter pc_iter)
  set methodPCIter
• ParConfigLIter parallel_configuration_iterator () const
  return methodPCIter
• void run (ParLevLIter pl_iter)
  invoke set_communicators(pl_iter) prior to run()
• void run ()
  orchestrate initialize/pre/core/post/finalize phases
• void assign_rep (Iterator ∗iterator_rep, bool ref_count_incr=true)
  replaces existing letter with a new one
• void iterated_model (const Model &model)
  set the iteratedModel (iterators and meta-iterators using a single model instance)
• Model & iterated_model ()
  return the iteratedModel (iterators & meta-iterators using a single model instance)
• ProblemDescDB & problem_description_db () const
  return the problem description database (probDescDB)
• ParallelLibrary & parallel_library () const
  return the parallel library (parallelLib)
• void method_name (unsigned short m_name)
  set the method name to an enumeration value
• unsigned short method_name () const
  return the method name via its native enumeration value
• void method_string (const String &m_str)
  set the method name by string
• String method_string () const
  return the method name by string
• String method_enum_to_string (unsigned short method_enum) const
  convert a method name enumeration value to a string
• unsigned short method_string_to_enum (const String &method_str) const
  convert a method string name to an enumeration value
• String submethod_enum_to_string (unsigned short submethod_enum) const
  convert a sub-method name enumeration value to a string
• const String & method_id () const
  return the method identifier (methodId)
• int maximum_evaluation_concurrency () const
  return the maximum evaluation concurrency supported by the iterator
• void maximum_evaluation_concurrency (int max_conc)
  set the maximum evaluation concurrency supported by the iterator
• int maximum_iterations () const
13.83. ITERATOR CLASS REFERENCE

return the maximum iterations for this iterator

- void maximum_iterations (int max_iter)
  set the maximum iterations for this iterator

- void convergence_tolerance (Real conv_tol)
  set the method convergence tolerance (convergenceTol)

- Real convergence_tolerance () const
  return the method convergence tolerance (convergenceTol)

- void output_level (short out_lev)
  set the method output level (outputLevel)

- short output_level () const
  return the method output level (outputLevel)

- void summary_output (bool summary_output_flag)
  Set summary output control; true enables evaluation/results summary.

- size_t num_final_solutions () const
  return the number of solutions to retain in best variables/response arrays

- void num_final_solutions (size_t num_final)
  set the number of solutions to retain in best variables/response arrays

- void active_set (const ActiveSet &set)
  set the default active set (for use with iterators that employ evaluate_parameter_sets())

- const ActiveSet & active_set () const
  return the default active set (used by iterators that employ evaluate_parameter_sets())

- void active_set_request_vector (const ShortArray &asv)
  return the default active set request vector (used by iterators that employ evaluate_parameter_sets())

- const ShortArray & active_set_request_vector () const
  return the default active set request vector (used by iterators that employ evaluate_parameter_sets())

- void active_set_request_values (short asv_val)
  return the default active set request vector (used by iterators that employ evaluate_parameter_sets())

- void sub_iterator_flag (bool si_flag)
  set subIteratorFlag (and update summaryOutputFlag if needed)

- void active_variable_mappings (const SizetArray &c_index1, const SizetArray &di_index1, const Sizet-
  Array &ds_index1, const SizetArray &dr_index1, const ShortArray &c_target2, const ShortArray &di_-target2, const ShortArray &ds_target2, const ShortArray &dr_target2)
  set primaryA{CV,DIV,DRV}MapIndices, secondaryA{CV,DIV,DRV}MapTargets

- bool is_null () const
  function to check iteratorRep (does this envelope contain a letter?)

- Iterator * iterator_rep () const
  returns iteratorRep for access to derived class member functions that are not mapped to the top Iterator level

- virtual void eval_tag_prefix (const String &eval_id_str)
  set the hierarchical eval ID tag prefix

- std::shared_ptr< TraitsBase > traits () const
  returns methodTraits for access to derived class member functions that are not mapped to the top TraitsBase level

- bool top_level ()
  Return whether the iterator is the top level iterator.

- void top_level (const bool &tflag)
  Set the iterator's top level flag,
CHAPTER 13. CLASS DOCUMENTATION

Protected Member Functions

- **Iterator** (BaseConstructor, ProblemDescDB &problem_db, std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>{new TraitsBase()})
  
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- **Iterator** (NoDBBaseConstructor, unsigned short method_name, Model &model, std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>{new TraitsBase()})
  
  alternate constructor for base iterator classes constructed on the fly

- **Iterator** (NoDBBaseConstructor, unsigned short method_name, std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>{new TraitsBase()})
  
  alternate constructor for base iterator classes constructed on the fly

- virtual void derived_init_communicators (ParLevLIter pl_iter)
  
  derived class contributions to initializing the communicators associated with this Iterator instance

- virtual void update_from_model (const Model &model)
  
  set inherited data attributes based on extractions from incoming model

- virtual const VariablesArray & initial_points () const
  
  gets the multiple initial points for this iterator. This will only be meaningful after a call to initial_points mutator.

- StrStrSzInt run_identifier () const
  
  get the unique run identifier based on method name, id, and number of executions

Static Protected Member Functions

- static void gnewton_set_recast (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)
  
  conversion of request vector values for the Gauss-Newton Hessian approximation

Protected Attributes

- **ProblemDescDB & probDescDB**
  
  class member reference to the problem description database

- **ParallelLibrary & parallelLib**
  
  class member reference to the parallel library

- ParConfigLIter methodPCIter
  
  the active ParallelConfiguration used by this Iterator instance

- Model iteratedModel
  
  the model to be iterated (for iterators and meta-iterators employing a single model instance)

- size_t myModelLayers
  
  number of Models locally (in Iterator or derived classes) wrapped around the initially passed in Model

- unsigned short methodName
  
  name of the iterator (the user's method spec)

- Real convergenceTol
  
  iteration convergence tolerance

- int maxIterations
  
  maximum number of iterations for the iterator
13.83. ITERATOR CLASS REFERENCE

- `int maxFunctionEvals`  
  maximum number of fn evaluations for the iterator

- `int maxEvalConcurrency`  
  maximum number of concurrent model evaluations

- `ActiveSet activeSet`  
  the response data requirements on each function evaluation

- `size_t numFinalSolutions`  
  number of solutions to retain in best variables/response arrays

- `VariablesArray bestVariablesArray`  
  collection of N best solution variables found during the study; always in context of Model originally passed to the Iterator (any in-flight Recasts must be undone)

- `ResponseArray bestResponseArray`  
  collection of N best solution responses found during the study; always in context of Model originally passed to the Iterator (any in-flight Recasts must be undone)

- `bool subIteratorFlag`  
  flag indicating if this Iterator is a sub-iterator (NestedModel::subIterator or DataFitSurrModel::daceIterator)

- `SizetArray primaryACVarMapIndices`  
  "primary" all continuous variable mapping indices flowed down from higher level iteration

- `SizetArray primaryADIVarMapIndices`  
  "primary" all discrete int variable mapping indices flowed down from higher level iteration

- `SizetArray primaryADSVarMapIndices`  
  "primary" all discrete string variable mapping indices flowed down from higher level iteration

- `SizetArray primaryADRVarMapIndices`  
  "primary" all discrete real variable mapping indices flowed down from higher level iteration

- `ShortArray secondaryACVarMapTargets`  
  "secondary" all continuous variable mapping targets flowed down from higher level iteration

- `ShortArray secondaryADIVarMapTargets`  
  "secondary" all discrete int variable mapping targets flowed down from higher level iteration

- `ShortArray secondaryADSVarMapTargets`  
  "secondary" all discrete string variable mapping targets flowed down from higher level iteration

- `ShortArray secondaryADRVarMapTargets`  
  "secondary" all discrete real variable mapping targets flowed down from higher level iteration

- `short outputLevel`  
  output verbosity level: {SILENT,QUIET,NORMAL,VERBOSE,DEBUG}_OUTPUT

- `bool summaryOutputFlag`  
  flag for summary output (evaluation stats, final results); default true, but false for on-the-fly (helper) iterators and sub-iterator use cases

- `ResultsManager & resultsDB`  
  reference to the global iterator results database

- `EvaluationStore & evaluationsDB`  
  reference to the global evaluation database

- `EvaluationsDBState evaluationsDBState`  
  State of evaluations DB for this iterator.

- `ResultsNames resultsNames`
valid names for iterator results

- std::shared_ptr<TraitsBase> methodTraits
  pointer that retains shared ownership of a TraitsBase object, or child thereof
- bool topLevel
  Whether this is the top level iterator.

Private Member Functions

- Iterator * get_iterator (ProblemDescDB &problem_db)
  Used by the envelope to instantiate the correct letter class.
- Iterator * get_iterator (ProblemDescDB &problem_db, Model &model)
  Used by the envelope to instantiate the correct letter class.
- Iterator * get_iterator (const String &method_string, Model &model)
  Used by the envelope to instantiate the correct letter class.

Static Private Member Functions

- static String user_auto_id ()
  return the next available method ID for no-ID user methods
- static String no_spec_id ()
  return the next available method ID for on-the-fly methods

Private Attributes

- String methodId
  method identifier string from the input file, or an auto-generated ID, such that each instance of an Iterator has a unique ID
- size_t execNum
  An execution number for this instance of the class. Now that each instance has a unique methodId, this is just a simple counter.
- std::map<size_t, ParConfigLIter> methodPCIterMap
  track the available configurations that have been created (init_communicators) and are available for activation at runtime (set_communicators)
- Iterator * iteratorRep
  pointer to the letter (initialized only for the envelope)
- int referenceCount
  number of objects sharing iteratorRep

Static Private Attributes

- static size_t noSpecIdNum = 0
  the last used method ID number for on-the-fly instantiations (increment before each use)
13.83. **ITERATOR CLASS REFERENCE**

13.83.1 Detailed Description

Base class for the iterator class hierarchy.

The `Iterator` class is the base class for one of the primary class hierarchies in DAKOTA. The iterator hierarchy contains all of the iterative algorithms which use repeated execution of simulations as function evaluations. For memory efficiency and enhanced polymorphism, the iterator hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (`Iterator`) serves as the envelope and one of the derived classes (selected in `Iterator::get_iterator()`) serves as the letter.

13.83.2 Constructor & Destructor Documentation

**Iterator ( std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) )**

default constructor

The default constructor is used in `Vector<Iterator>` instantiations and for initialization of `Iterator` objects contained in meta-Iterators and `Model` recursions. `iteratorRep` is NULL in this case, making it necessary to check for NULL pointers in the copy constructor, assignment operator, and destructor.

**Iterator ( Iterator* iterator_rep, bool ref_count_incr = true, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) )**

alternate envelope constructor that assigns a representation pointer

This constructor assigns a representation pointer and optionally increments its reference count. It behaves the same as a default construction followed by `assign_rep()`.

References `Iterator::iteratorRep`, and `Iterator::referenceCount`.

**Iterator ( ProblemDescDB & problem_db, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) )**

standard envelope constructor, which constructs its own model(s)

Envelope constructor only needs to extract enough data to properly execute `get_iterator()`, since letter holds the actual base class data. This version is used for top-level ProblemDescDB-driven construction of all Iterators and MetaIterators, which construct their own `Model` instances.

References Dakota::abort_handler(), Iterator::get_iterator(), and Iterator::iteratorRep.

**Iterator ( ProblemDescDB & problem_db, Model & model, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) )**

alternate envelope constructor which uses the ProblemDescDB but accepts a model from a higher level (meta-iterator) context, instead of constructing its own

Envelope constructor only needs to extract enough data to properly execute `get_iterator()`, since letter holds the actual base class data. This version is used for ProblemDescDB-driven construction of Iterators that are passed a `Model` from a higher-level context (e.g., a MetaIterator instantiates its sub-iterator(s) by name instead of pointer and passes in its iteratedModel, since these sub-iterators lack their own model pointers).

References Dakota::abort_handler(), Iterator::get_iterator(), and Iterator::iteratorRep.

**Iterator ( const String & method_string, Model & model, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) )**

alternate envelope constructor for instantiations by name without the ProblemDescDB
CHAPTER 13. CLASS DOCUMENTATION

Used in sub-iterator instantiations within iterator constructors. Envelope constructor only needs to extract enough data to properly execute get_iterator(), since letter holds the actual base class data. This version is used for lightweight constructions without the ProblemDescDB.

References Dakota::abort_handler(), Iterator::get_iterator(), and Iterator::iteratorRep.

**Iterator ( const Iterator & iterator )**
copy constructor

Copy constructor manages sharing of iteratorRep and incrementing of referenceCount.
References Iterator::iteratorRep, and Iterator::referenceCount.

**~Iterator( ) [virtual]**
destructor

Destructor decrements referenceCount and only deletes iteratorRep when referenceCount reaches zero.
References Iterator::iteratorRep, and Iterator::referenceCount.

**Iterator ( BaseConstructor, ProblemDescDB & problem_db, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) ) [protected]**

constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

This constructor builds the base class data for all inherited iterators, including meta-iterators. get_iterator() instantiates a derived class and the derived class selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_iterator() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Iterator).

References Iterator::method_enum_to_string(), Iterator::methodId, Iterator::methodName, Iterator::outputLevel, and Iterator::user_auto_id().

**Iterator ( NoDBBaseConstructor, unsigned short method_name, Model & model, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) ) [protected]**

alternate constructor for base iterator classes constructed on the fly

This alternate constructor builds base class data for inherited iterators. It is used for on-the-fly instantiations for which DB queries cannot be used, and is not used for construction of meta-iterators.

**Iterator ( NoDBBaseConstructor, unsigned short method_name, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) ) [protected]**

alternate constructor for base iterator classes constructed on the fly

This alternate constructor builds base class data for inherited iterators. It is used for on-the-fly instantiations for which DB queries cannot be used, and is not used for construction of meta-iterators. It has no incoming model, so only sets up a minimal set of defaults. However, its use is preferable to the default constructor, which should remain as minimal as possible.

**13.83.3 Member Function Documentation**

**Iterator operator= ( const Iterator & iterator )**

assignment operator
13.8.3. ITERATOR CLASS REFERENCE

References Iterator::iteratorRep, and Iterator::referenceCount.

```cpp
void initialize_run() [virtual]
```
utility function to perform common operations prior to pre_run(); typically memory initialization; setting of instance pointers

Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically before performing its own implementation steps.

Reimplemented in Optimizer, NonD, Minimizer, Analyzer, ROLOptimizer, and LeastSq.

References Iterator::initialize_run(), and Iterator::iteratorRep.

Referenced by Iterator::initialize_run(), Iterator::run(), and SeqHybridMetaIterator::run_sequential_adaptive().

```cpp
void pre_run() [virtual]
```
pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented in NonDSampling, NonD, Analyzer, NonDLHSampling, DDACEDesignCompExp, ConcurrentMetaIterator, NonDRKDDarts, FUDDesignCompExp, ParamStudy, NonDMultilevelSampling, PSUADEDesignCompExp, and SurrBasedLocalMinimizer.

References Iterator::iteratorRep, and Iterator::pre_run().

Referenced by NonDBayesCalibration::build_designs(), Iterator::pre_run(), and Iterator::run().

```cpp
void core_run() [virtual]
```
core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

References Dakota::abort_handler(), Iterator::core_run(), and Iterator::iteratorRep.

Referenced by Iterator::core_run(), and Iterator::run().

```cpp
void post_run(std::ostream & s) [virtual]
```
post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically after performing its own implementation steps.
Reimplemented in Optimizer, NonDRKDarts, Minimizer, Analyzer, NonDLHSSampling, DDACEDesign-CompExp, PSUADesignCompExp, MetaIterator, ParamStudy, PSUADesignCompExp, SurrBasedLocalMinimizer, NonDMultilevelSampling, and LeastSq.

References Iterator::iteratorRep, and Iterator::post_run().

Referenced by Iterator::post_run(), and Iterator::run().

void finalize_run( ) [virtual]

utility function to perform common operations following post_run(); deallocation and resetting of instance pointers

Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically after performing its own implementation steps.

Reimplemented in Optimizer, NonD, Minimizer, Analyzer, and LeastSq.

References Iterator::finalize_run(), and Iterator::iteratorRep.

Referenced by Iterator::finalize_run(), Analyzer::finalize_run(), Minimizer::finalize_run(), Iterator::run(), and SeqHybridMetaIterator::run_sequential_adaptive().

void initialize_graphics( int iterator_server_id = 1 ) [virtual]

initialize the 2D graphics window and the tabular graphics data

This is a convenience function for encapsulating graphics initialization operations. It is overridden by derived classes that specialize the graphics display.

Reimplemented in NonDReliability, and SurrBasedMinimizer.

References Model::auto_graphics(), Graphics::create_plots_2d(), OutputManager::create_tabular_datastream(), Model::current_response(), Model::current_variables(), OutputManager::graph2DFlag, OutputManager::graphics(), Iterator::initialize_graphics(), Iterator::iteratedModel, Iterator::iteratorRep, ParallelLibrary::output_manager(), Iterator::parallelLib, and OutputManager::tabularDataFlag.

Referenced by CollabHybridMetaIterator::core_run(), EmbedHybridMetaIterator::core_run(), ConcurrentMetaIterator::core_run(), Environment::execute(), Iterator::initialize_graphics(), SeqHybridMetaIterator::run_sequential(), and SeqHybridMetaIterator::run_sequential_adaptive().

void print_results( std::ostream & s, short results_state = FINAL_RESULTS ) [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented in Optimizer, NonDPolynomialChaos, Analyzer, NonDGPMsABayesCalibration, NonDLHSSampling, NonDBayesCalibration, NonDPOFDarts, NonDMultilevelPolynomialChaos, NonDQUESTOBayesCalibration, NonDLocalReliability, NonDWasABIBayesCalibration, SeqHybridMetaIterator, NonDAdaptiveSampling, ConcurrentMetaIterator, NonDGPImpSampling, NonDMultilevelStochCollocation, NonDAdaptImpSampling, NonDInterval, NonDMultilevelSampling, PStudyDACE, NonDExpansion, LeastSq, Verification, NonDGlobalReliability, SurrBasedMinimizer, and RichExtrapVerification.

References Iterator::iteratorRep, and Iterator::print_results().

Referenced by MetaIterator::post_run(), Minimizer::post_run(), and Iterator::print_results().

unsigned short uses_method( ) const [virtual]

return name of any enabling iterator used by this iterator

This is used to avoid clashes in state between non-object-oriented (i.e., F77, C) iterator executions, when such iterators could potentially be executing simultaneously (e.g., nested execution). It is not an issue (and a used
13.83. ITERATOR CLASS REFERENCE

method is not reported) in cases where a helper execution is completed before a lower level one could be initiated; an example of this is DIRECT for maximization of expected improvement: the EIF maximization is completed before a new point evaluation (which could include nested iteration) is performed.

Reimplemented in NonDLocalReliability, and NonDLocalInterval.

References Iterator::iteratorRep, and Iterator::uses_method().

Referenced by NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), SOLBase::SOLBase(), and Iterator::uses_method().

void run ( )

orchestrate initialize/pre/core/post/finalize phases

Iterator supports a construct/initialize-run/pre-run/core-run/post-run/ finalize-run/destruct progression. This member (non-virtual) function sequences these run phases.

References ParallelLibrary::command_line_post_run(), ParallelLibrary::command_line_pre_run(), ParallelLibrary::command_line_run(), Iterator::core_run(), Iterator::declare_sources(), Iterator::evaluationsDB, Iterator::evaluationsDBState, Iterator::execNum, Iterator::finalize_run(), ResultsManager::flush(), Iterator::initialize_run(), Iterator::iteratorRep, Iterator::method_enum_to_string(), Iterator::method_id(), Iterator::method_string(), Iterator::method_Name, Iterator::outputLevel, Iterator::parallelLib, Iterator::pre_input(), Iterator::pre_run(), Iterator::pre_output(), Iterator::pre_run(), Iterator::resultsDB, Iterator::run(), Iterator::summaryOutputFlag, and Iterator::top_level().

Referenced by Iterator::run().

void assign_rep ( Iterator * iterator_rep, bool ref_count_incr = true )

replaces existing letter with a new one

Similar to the assignment operator, the assign_rep() function decrements referenceCount for the old iterator-Rep and assigns the new iteratorRep. It is different in that it is used for publishing derived class letters to existing envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign_rep is passed a letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by ref_count_incr:

- ref_count_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the reference count in the normal manner so that deallocation of the letter is handled properly.

- ref_count_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is modeled after get_iterator(): a letter is dynamically allocated using new and passed into assign_rep, the letter’s reference count is not incremented, and the letter is not remotely deleted (its memory management is passed over to the envelope).

References Dakota::abort_handler(), Iterator::iterator_rep(), Iterator::iteratorRep, and Iterator::referenceCount.

Referenced by NonDBayesCalibration::build_designs(), NonDExpansion::construct_cubature(), NonDExpansion::construct expansion sampler(), NonDAdaptiveSampling::construct_fsu_sampler(), NonD::construct_lhs(), NonDBayesCalibration::construct_map_optimizer(), NonDBayesCalibration::construct_mcmc_model(), NonDExpansion::construct_quadrature(), NonDExpansion::construct sparse_grid(), Minimizer::data_transform_model(), EffGlobalMinimizer::EffGlobalMinimizer(), ActiveSubspaceModel::init_fullspace_sampler(), NonDLocalInterval::method_recourse(), NonDLocalReliability::method_recourse(), NonDAdaptiveSampling::NonDAdaptiveSampling(), NonDBayesCalibration::NonDBayesCalibration(), NonDGlobalInterval::NonDGlobalInterval(), NonDGPImpSampling::NonDGPImpSampling(), NonDGPMSABayesCalibration::NonDGPMSABayesCalibration(), NonDLHSInterval::NonDLHSInterval(), NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), GaussProcApproximation::optimize_theta_global(), GaussProcApproximation::optimize_theta_multipoint(), and SurrBasedLocalMinimizer::relax_constraints().
void eval_tag_prefix ( const String & eval_id_str ) [virtual]

set the hierarchical eval ID tag prefix

This prepend may need to become a virtual function if the tagging should propagate to other subModels or
helper Iterators an Iterator may contain.

References Iterator::eval_tag_prefix(), Model::eval_tag_prefix(), Iterator::iteratedModel, and Iterator::iterator-
Rep.

Referenced by NestedModel::derived_evaluate(), Iterator::eval_tag_prefix(), Iterator::init_communicators(), Nested-
Model::initialize_iterator(), and DataFitSurrModel::run_dace().

void gnewton_set_recast ( const Variables & recast_vars, const ActiveSet & recast_set, ActiveSet & sub_model_set ) [static], [protected]

conversion of request vector values for the Gauss-Newton Hessian approximation

For Gauss-Newton Hessian requests, activate the 2 bit and mask the 4 bit.

References ActiveSet::request_value(), and ActiveSet::request_vector().

Referenced by NonDBayesCalibration::construct_map_optimizer(), and Optimizer::reduce_model().

Iterator * get_iterator ( ProblemDescDB & problem_db ) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type, as given by
the DB’s method_name. Supports all iterators and meta-iterators. These instantiations will NOT recurse on the
Iterator(problem_db) constructor due to the use of BaseConstructor.

References ProblemDescDB::get_model(), ProblemDescDB::get_ushort(), Iterator::method_enum_to_string(),
Iterator::method_name(), and Dakota::SUBMETHOD_COLLABORATIVE.

Referenced by Iterator::Iterator().

Iterator * get_iterator ( ProblemDescDB & problem_db, Model & model ) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type. Alternate
construction of meta-itors is supported to enable use of meta-itors as components. These instantiations
will NOT recurse on the Iterator(problem_db, model) constructor due to the use of BaseConstructor.

References ProblemDescDB::get_ushort(), Iterator::method_enum_to_string(), Iterator::method_name(), Iterator-
::probDescDB, Dakota::SUBMETHOD_COLLABORATIVE, Iterator::submethod_enum_to_string(), and Model-
::surrogate_type().

Iterator * get_iterator ( const String & method_string, Model & model ) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize iteratorRep to the appropriate derived type, as given by
the passed method_string. Lightweight instantiations by name are supported by a subset of Iterators (primarily
Minimizers).

References Dakota::strbegins(), and Dakota::strends().

String user_auto_id ( ) [static], [private]

return the next available method ID for no-ID user methods

Rationale: The parser allows multiple user-specified methods with empty (unspecified) ID. However, only a
single Iterator with empty ID can be constructed (if it’s the only one present, or the "last one parsed"). Therefore
decided to prefer NO_METHOD_ID over NO_METHOD_ID_ for (partial) consistency with interface N-O_ID convention. The addition of METHOD is it distinguish methods, models and interfaces in the HDF5 output.

Referenced by Iterator::Iterator().

String no_spec_id() [static], [private]
return the next available method ID for on-the-fly methods

Rationale: For now NOSPEC_METHOD_ID_ is chosen due to historical id="NO_SPECIFICATION" used for internally-constructed Iterators. Longer-term, consider auto-generating an ID that includes the context from which the method is constructed, e.g., the parent method or model’s ID, together with its name.

References Iterator::noSpecIdNum.

### 13.83.4 Member Data Documentation

**ProblemDescDB& probDescDB [protected]**
class member reference to the problem description database

Referenced by MetaIterator::allocate_by_name(), MetaIterator::allocate_by_pointer(), Analyzer::Analyzer(), MetaIterator::check_model(), NonDBayesCalibration::construct_mcmc_model(), Minimizer::data_transform_model(), SurrBasedMinimizer::derived_init_communicators(), EmbedHybridMetaIterator::derived_init_communicators(), ConcurrentMetaIterator::derived_init_communicators(), EffGlobalMinimizer::EffGlobalMinimizer(), MetaIterator::estimate_by_name(), MetaIterator::estimate_by_pointer(), CollabHybridMetaIterator::estimate_partition_bounds(), EmbedHybridMetaIterator::estimate_partition_bounds(), ConcurrentMetaIterator::estimate_partition_bounds(), SeqHybridMetaIterator::estimate_partition_bounds(), FSUDesignCompExp::FSUDesignCompExp(), Iterator::get_iterator(), ConcurrentMetaIterator::initialize_model(), NOWPACOptimizer::initialize_options(), SurrBasedLocalMinimizer::initialize_sub_minimizer(), JEGAOptimizer::JEGAOptimizer(), NonD::NonD(), NonDAdaptImpSampling::NonDAdaptImpSampling(), NonDAdaptiveSampling::NonDAdaptiveSampling(), NonDBayesCalibration::NonDBayesCalibration(), NonDInterval::NonDInterval(), NonDGPImpSampling::NonDGPImpSampling(), NonDGPMASABayesCalibration::NonDGPMASABayesCalibration(), NonDInterval::NonDInterval(), NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), NonDMultilevelPolynomialChaos::NonDMultilevelPolynomialChaos(), NonDMultilevelStochCollocation::NonDMultilevelStochCollocation(), NonDNonPolynomialChaos::NonDNonPolynomialChaos(), NonDQuad::NonDQuad(), NonDSampling::NonDSampling(), NonDSparseGrid::NonDSparseGrid(), NonDStochCollocation::NonDStochCollocation(), OptDartsOptimizer::OptDartsOptimizer(), ParamStudy::ParamStudy(), NonlinearCGOptimizer::parse_options(), NonDAdaptiveSampling::parse_options(), Iterator::problem_description_db(), ROLOptimizer::set_rol_parameters(), and SurrBasedGlobalMinimizer::SurrBasedGlobalMinimizer().

**int maxEvalConcurrency [protected]**
maximum number of concurrent model evaluations

This is important for parallel configuration init/set/free and may be set within empty envelope instances. Therefore, it cannot be pushed down into Analyzer/Minimizer derived classes.

### 13.84 IteratorScheduler Class Reference

This class encapsulates scheduling operations for concurrent sub-iteration within an outer level context (e.g., meta-iteration, nested models).

#### Public Member Functions

- **IteratorScheduler (ParallelLibrary &parallel_lib, bool peer_assign_jobs, int num_servers=0, int procs_per_iterator=0, short scheduling=DEFAULT_SCHEDULING)**
  
  *constructor*

- **~IteratorScheduler ()**
  
  *destructor*

- **void construct_sub_iterator (ProblemDescDB &problem_db, Iterator &sub_iterator, Model &sub_model, const String &method_ptr, const String &method_name, const String &model_ptr)**

  * instantiate sub_iterator on the current rank if not already constructed*

- **IntIntPair configure (ProblemDescDB &problem_db, Iterator &sub_iterator, Model &sub_model)**

  *performs sufficient initialization to define partitioning controls (min and max processors per iterator server)*

- **IntIntPair configure (ProblemDescDB &problem_db, const String &method_string, Iterator &sub_iterator, Model &sub_model)**

  *performs sufficient initialization to define partitioning controls (min and max processors per iterator server)*

- **IntIntPair configure (ProblemDescDB &problem_db, Iterator &sub_iterator)**

  *performs sufficient initialization to define partitioning controls (min and max processors per iterator server)*

- **void partition (int max_iterator_concurrency, IntIntPair &ppi_pr)**
convenience function for initializing iterator communicators, setting parallel configuration attributes, and managing outputs and restart.

- void init_iterator (ProblemDescDB &problem_db, Iterator &sub_iterator, Model &sub_model)
  invokes static version of this function with appropriate parallelism level

- void init_iterator (ProblemDescDB &problem_db, const String &method_string, Iterator &sub_iterator, Model &sub_model)
  invokes static version of this function with appropriate parallelism level

- void set_iterator (Iterator &sub_iterator)
  invokes static version of this function with appropriate parallelism level

- void run_iterator (Iterator &sub_iterator)
  invokes static version of this function with appropriate parallelism level

- void free_iterator (Iterator &sub_iterator)
  invokes static version of this function with appropriate parallelism level

- void free_iterator_parallelism ()
  convenience function for deallocating the concurrent iterator parallelism level

- template<typename MetaType >
  void schedule_iterators (MetaType &meta_object, Iterator &sub_iterator)
  short convenience function for distributing control among master_dynamic_schedule_iterators(), serve_iterators(), and peer_static_schedule_iterators()

- template<typename MetaType >
  void master_dynamic_schedule_iterators (MetaType &meta_object)
  executed by the scheduler master to manage a dynamic schedule of iterator jobs among slave iterator servers

- void stop_iterator_servers ()
  executed by the scheduler master to terminate slave iterator servers

- template<typename MetaType >
  void serve_iterators (MetaType &meta_object, Iterator &sub_iterator)
  executed on the slave iterator servers to perform iterator jobs assigned by the scheduler master

- template<typename MetaType >
  void peer_static_schedule_iterators (MetaType &meta_object, Iterator &sub_iterator)
  executed on iterator peers to manage a static schedule of iterator jobs

- void update (ParConfigLIter pc_iter)
  update schedPCIter

- void update (size_t index)
  update miPLIndex as well as associated settings for concurrent iterator scheduling from the corresponding Parallel-Level

- void update (ParConfigLIter pc_iter, size_t index)
  invoke update(ParConfigLIter) and update(size_t) in sequence

- void iterator_message_lengths (int params_msg_len, int results_msg_len)
  update paramsMsgLen and resultsMsgLen

- bool lead_rank () const
  determines if current processor is rank 0 of the parent comm
Static Public Member Functions

- static void *init_iterator* (ProblemDescDB &problem, Iterator &sub_iterator, ParLevLIter pl_iter)
  convenience function for allocation of an iterator and (parallel) initialization of its comms
- static void *init_iterator* (ProblemDescDB &problem, Iterator &sub_iterator, Model &sub_model, ParLevLIter pl_iter)
  convenience function for allocation of an iterator and (parallel) initialization of its comms
- static void *init_iterator* (ProblemDescDB &problem, const String &method_string, Iterator &sub_iterator, Model &sub_model, ParLevLIter pl_iter)
  convenience function for lightweight allocation of an iterator and (parallel) initialization of its comms
- static void *set_iterator* (Iterator &sub_iterator, ParLevLIter pl_iter)
  convenience function for setting comms prior to running an iterator
- static void *run_iterator* (Iterator &sub_iterator, ParLevLIter pl_iter)
  Convenience function for invoking an iterator and managing parallelism. This version omits communicator repartitioning. Function must be public due to use by MINLPNode.
- static void *free_iterator* (Iterator &sub_iterator, ParLevLIter pl_iter)
  convenience function for deallocating comms after running an iterator

Public Attributes

- ParallelLibrary & parallelLib
  reference to the ParallelLibrary instance
- int numIteratorJobs
  number of iterator executions to schedule
- int numIteratorServers
  number of concurrent iterator partitions
- intprocsPerIterator
  partition size request
- int iteratorCommRank
  processor rank in iteratorComm
- int iteratorCommSize
  number of processors in iteratorComm
- int iteratorServerId
  identifier for an iterator server
- bool messagePass
  flag for message passing among iterator servers
- short iteratorScheduling
  {DEFAULT,MASTER,PEER}_SCHEDULING
- bool peerAssignJobs
  flag indicating need for peer 1 to assign jobs < to peers 2-n
- ParConfigLIter schedPCIter
  iterator for active parallel configuration
- size_t miPLIndex
  index of active parallel level (corresponding < to ParallelConfiguration::miPLIthers) to use < for parallelLib send/recv
Private Attributes

- int paramsMsgLen
  length of MPI buffer for parameter input instance(s)
- int resultsMsgLen
  length of MPI buffer for results output instance(s)

13.84.1 Detailed Description

This class encapsulates scheduling operations for concurrent sub-iteration within an outer level context (e.g., meta-iteration, nested models).

In time, a Scheduler class hierarchy is envisioned, but for now, this class is not part of a hierarchy.

13.84.2 Constructor & Destructor Documentation

IteratorScheduler ( ParallelLibrary & parallel_lib, bool peer_assign_jobs, int num_servers = 0, int procs_per_iterator = 0, short scheduling = DEFAULT_SCHEDULING )

constructor

Current constructor parameters are the input specification components, which are requests subject to override by ParallelLibrary::init_iterator_communicators().

13.84.3 Member Function Documentation

void init_iterator ( ProblemDescDB & problem_db, Iterator & sub_iterator, ParLevLIter pl_iter ) [static]

convenience function for allocation of an iterator and (parallel) initialization of its comms

This is a convenience function for encapsulating the allocation of communicators prior to running an iterator.

References ProblemDescDB::get_iterator(), ProblemDescDB::get_model(), ProblemDescDB::get_ushort(), Model::init_comms_bcast_flag(), Iterator::init_communicators(), Iterator::is_null(), Model::is_null(), Iterator::iterated_model(), Iterator::maximum_evaluation_concurrency(), Iterator::method_name(), Model::serve_init_communicators(), and Model::stop_init_communicators().

Referenced by MetaIterator::allocate_by_name(), MetaIterator::allocate_by_pointer(), Environment::construct(), ConcurrentMetaIterator::derived_init_communicators(), NestedModel::derived_init_communicators(), and IteratorScheduler::init_iterator().

void init_iterator ( ProblemDescDB & problem_db, Iterator & sub_iterator, Model & sub_model, ParLevLIter pl_iter ) [static]

convenience function for allocation of an iterator and (parallel) initialization of its comms

This is a convenience function for encapsulating the allocation of communicators prior to running an iterator.

References ProblemDescDB::get_iterator(), ProblemDescDB::get_ushort(), Model::init_comms_bcast_flag(), Iterator::init_communicators(), Iterator::is_null(), Iterator::iterated_model(), Iterator::maximum_evaluation_concurrency(), Iterator::method_name(), Model::serve_init_communicators(), and Model::stop_init_communicators().

void init_iterator ( ProblemDescDB & problem_db, const String & method_string, Iterator & sub_iterator, Model & sub_model, ParLevLIter pl_iter ) [static]

convenience function for lightweight allocation of an iterator and (parallel) initialization of its comms

This is a convenience function for encapsulating the allocation of communicators prior to running an iterator.
CHAPTER 13. CLASS DOCUMENTATION

References ProblemDescDB::get_iterator(), Model::init_comms_bcast_flag(), Iterator::init_communicators(), Iterator::is_null(), Iterator::iterated_model(), Iterator::maximum_evaluation_concurrency(), Iterator::method_string(), Model::serve_init_communicators(), and Model::stop_init_communicators.

`void set_iterator ( Iterator & sub_iterator, ParLevLIter pl_iter ) [static]`

convenience function for setting comms prior to running an iterator

This is a convenience function for encapsulating the deallocation of communicators after running an iterator.

References Iterator::derived_set_communicators(), and Iterator::set_communicators().

Referenced by CollabHybridMetaIterator::derived_set_communicators(), EmbedHybridMetaIterator::derived_set_communicators(), ConcurrentMetaIterator::derived_set_communicators(), SeqHybridMetaIterator::derived_set_communicators(), NestedModel::derived_set_communicators(), and IteratorScheduler::set_iterator().

`void run_iterator ( Iterator & sub_iterator, ParLevLIter pl_iter ) [static]`

Convenience function for invoking an iterator and managing parallelism. This version omits communicator repartitioning. Function must be public due to use by MINLPNode.

This is a convenience function for encapsulating the parallel features (run/serve) of running an iterator. This function omits allocation/deallocation of communicators to provide greater efficiency in approaches that involve multiple iterator executions but only require communicator allocation/deallocation to be performed once.

References Model::finalize_mapping(), Model::initialize_mapping(), Iterator::iterated_model(), Iterator::maximum_evaluation_concurrency(), Iterator::method_name(), Iterator::resize(), Iterator::resize_communicators(), Iterator::run(), Model::serve_finalize_mapping(), Model::serve_init_mapping(), Model::serve_run(), Model::stop_finalize_mapping(), Model::stop_init_mapping(), and Model::stop_servers().

Referenced by NestedModel::derived_evaluate(), Environment::execute(), IteratorScheduler::peer_static_schedule_iterators(), IteratorScheduler::run_iterator(), and IteratorScheduler::serve_iterators().

`void free_iterator ( Iterator & sub_iterator, ParLevLIter pl_iter ) [static]`

convenience function for deallocating comms after running an iterator

This is a convenience function for encapsulating the deallocation of communicators after running an iterator.

References Iterator::derived_free_communicators(), Iterator::free_communicators(), and Iterator::method_name().

Referenced by CollabHybridMetaIterator::derived_free_communicators(), EmbedHybridMetaIterator::derived_free_communicators(), ConcurrentMetaIterator::derived_free_communicators(), SeqHybridMetaIterator::derived_free_communicators(), NestedModel::derived_free_communicators(), Environment::destruct(), and IteratorScheduler::free_iterator().

`IntIntPair configure ( ProblemDescDB & problem_db, Iterator & sub_iterator, Model & sub_model )`

performs sufficient initialization to define partitioning controls (min and max processors per iterator server)

This is a convenience function for computing the minimum and maximum partition size prior to concurrent iterator partitioning.

References ProblemDescDB::get_iterator(), IteratorScheduler::schedPCIter, and ParallelLevel::server_communicator_rank().

Referenced by IteratorScheduler::configure(), ConcurrentMetaIterator::derived_init_communicators(), NestedModel::derived_init_communicators(), MetaIterator::estimate_by_name(), and MetaIterator::estimate_by_pointer().
IntIntPair configure (ProblemDescDB & problem_db, const String & method_string, Iterator & sub_iterator, Model & sub_model)

performs sufficient initialization to define partitioning controls (min and max processors per iterator server).

This is a convenience function for computing the minimum and maximum partition size prior to concurrent iterator partitioning.

References IteratorScheduler::configure(), ProblemDescDB::get_iterator(), IteratorScheduler::schedPCIter, and ParallelLevel::server_communicator_rank().

IntIntPair configure (ProblemDescDB & problem_db, Iterator & sub_iterator)

performs sufficient initialization to define partitioning controls (min and max processors per iterator server).

This is a convenience function for computing the minimum and maximum partition size prior to concurrent iterator partitioning.

References ParallelLibrary::bcast(), Iterator::estimate_partition_bounds(), ProblemDescDB::get_db_method_node(), ProblemDescDB::get_db_model_node(), IteratorScheduler::parallelLib, IteratorScheduler::schedPCIter, ParallelLevel::server_communicator_rank(), ParallelLevel::server_communicator_size(), ProblemDescDB::set_db_method_node(), ProblemDescDB::set_db_model_nodes(), and MPIPackBuffer::size().

void partition (int max_iterator_concurrency, IntIntPair & ppi_pr)

convenience function for initializing iterator communicators, setting parallel configuration attributes, and managing outputs and restart.

Called from derived class constructors once maxIteratorConcurrency is defined but prior to instantiating Iterators and Models.

References ParallelLibrary::init_iterator_communicators(), IteratorScheduler::iteratorScheduling, IteratorScheduler::numIteratorServers, ParallelLibrary::parallel_configuration_iterator(), IteratorScheduler::parallelLib, IteratorScheduler::procsPerIterator, ParallelLibrary::push_output_tag(), and IteratorScheduler::update().

Referenced by CollabHybridMetaIterator::derived_init_communicators(), EmbedHybridMetaIterator::derived_init_communicators(), ConcurrentMetaIterator::derived_init_communicators(), SeqHybridMetaIterator::derived_init_communicators(), and NestedModel::derived_init_communicators().

void schedule_iterators (MetaType & meta_object, Iterator & sub_iterator)

short convenience function for distributing control among master_dynamic_schedule_iterators(), serve_iterators(), and peer_static_schedule_iterators().

This implementation supports the scheduling of multiple jobs using a single iterator/model pair. Additional future (overloaded) implementations could involve independent iterator instances.

References IteratorScheduler::iteratorScheduling, IteratorScheduler::iteratorServerId, IteratorScheduler::lead_rank(), IteratorScheduler::master_dynamic_schedule_iterators(), IteratorScheduler::numIteratorServers, ParallelLibrary::parallel_configuration_iterator(), IteratorScheduler::parallelLib, IteratorScheduler::peer_static_schedule_iterators(), IteratorScheduler::serve_iterators(), and IteratorScheduler::stop_iterator_servers().

Referenced by CollabHybridMetaIterator::core_run(), EmbedHybridMetaIterator::core_run(), ConcurrentMetaIterator::core_run(), NestedModel::derived_synchronize(), SeqHybridMetaIterator::run_sequential(), and NestedModel::serve_run().

void master_dynamic_schedule_iterators (MetaType & meta_object)

executed by the scheduler master to manage a dynamic schedule of iterator jobs among slave iterator servers.

This function is adapted from ApplicationInterface::master_dynamic_schedule_evaluations().
void serve_iterators ( MetaType & meta_object, Iterator & sub_iterator )

executed on the slave iterator servers to perform iterator jobs assigned by the scheduler master

This function is similar in structure to ApplicationInterface::serve_evaluations_synch().

The documentation for this class was generated from the following files:

- IteratorScheduler.hpp
- IteratorScheduler.cpp

13.85 JEGAOptimizer Class Reference

A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

Inheritance diagram for JEGAOptimizer:

```
    JEGAOptimizer
      |
    Optimizer
      |                        
    Minimizer
      |    
    Iterator
```

Classes

- class Driver
  
  A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

- class Evaluator

  An evaluator specialization that knows how to interact with Dakota.

- class EvaluatorCreator

  A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.
Public Member Functions

- virtual void core_run ()
  Performs the iterations to determine the optimal set of solutions.
- virtual bool accepts_multiple_points () const
  Overridden to return true since JEGA algorithms can accept multiple initial points.
- virtual bool returns_multiple_points () const
  Overridden to return true since JEGA algorithms can return multiple final points.
- virtual void initial_points (const VariablesArray &pts)
  Overridden to assign the _initPts member variable to the passed in collection of Dakota::Variables.
- virtual const VariablesArray & initial_points () const
  Overridden to return the collection of initial points for the JEGA algorithm created and run by this JEGAOptimizer.
- JEGAOptimizer (ProblemDescDB &problem_db, Model &model)
  Constructs a JEGAOptimizer class object.
- ~JEGAOptimizer ()
  Destructs a JEGAOptimizer.

Protected Member Functions

- void LoadDakotaResponses (const JEGA::Utilities::Design &from, Variables &vars, Response &resp) const
  Loads the JEGA-style Design class into equivalent Dakota-style Variables and Response objects.
- void ReCreateTheParameterDatabase ()
  Destroys the current parameter database and creates a new empty one.
- void LoadTheParameterDatabase ()
  Reads information out of the known Dakota::ProblemDescDB and puts it into the current parameter database.
- void LoadAlgorithmConfig (JEGA::FrontEnd::AlgorithmConfig &aConfig)
  Completely initializes the supplied algorithm configuration.
- void LoadProblemConfig (JEGA::FrontEnd::ProblemConfig &pConfig)
  Completely initializes the supplied problem configuration.
- void LoadTheDesignVariables (JEGA::FrontEnd::ProblemConfig &pConfig)
  Adds DesignVariableInfo objects into the problem configuration object.
- void LoadTheObjectiveFunctions (JEGA::FrontEnd::ProblemConfig &pConfig)
  Adds ObjectiveFunctionInfo objects into the problem configuration object.
- void LoadTheConstraints (JEGA::FrontEnd::ProblemConfig &pConfig)
  Adds ConstraintInfo objects into the problem configuration object.
- void GetBestSolutions (const JEGA::Utilities::DesignOFSortSet &from, const JEGA::Algorithms::GeneticAlgorithm &theGA, std::multimap<RealRealPair, JEGA::Utilities::Design> &designSortMap)
  Returns up to numBest designs sorted by DAKOTA’s fitness (L2 constraint violation, then utopia or objective), taking into account the algorithm type. The front of the returned map can be viewed as a single “best”.
- void GetBestMOSolutions (const JEGA::Utilities::DesignOFSortSet &from, const JEGA::Algorithms::GeneticAlgorithm &theGA, std::multimap<RealRealPair, JEGA::Utilities::Design> &designSortMap)
  Retrieve the best Designs from a set of solutions assuming that they are generated by a multi objective algorithm.
- void GetBestSOSolutions (const JEGA::Utilities::DesignOFSortSet &from, const JEGA::Algorithms::GeneticAlgorithm &theGA, std::multimap<RealRealPair, JEGA::Utilities::Design> &designSortMap)
  Retrieve the best Designs from a set of solutions assuming that they are generated by a single objective algorithm.
- JEGA::DoubleMatrix ToDoubleMatrix (const VariablesArray &variables) const
  Converts the items in a VariablesArray into a DoubleMatrix whereby the items in the matrix are the design variables.
Private Attributes

- **EvaluatorCreator * _theEvalCreator**
  A pointer to an EvaluatorCreator used to create the evaluator used by JEGA in Dakota (a JEGAEvaluator).

- **JEGA::Utilities::ParameterDatabase * _theParamDB**
  A pointer to the ParameterDatabase from which all parameters are retrieved by the created algorithms.

- **VariablesArray _initPts**
  An array of initial points to use as an initial population.

Additional Inherited Members

### 13.85.1 Detailed Description

A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

This class encapsulates the necessary functionality for creating and properly initializing the JEGA algorithms (MOGA and SOGA).

### 13.85.2 Constructor & Destructor Documentation

**JEGAOptimizer ( ProblemDescDB & problem_db, Model & model )**

Constructs a JEGAOptimizer class object.

This method does some of the initialization work for the algorithm. In particular, it initialized the JEGA core.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>problem_db</em></td>
<td>The Dakota::ProblemDescDB with information on how the algorithm controls should be set.</td>
</tr>
<tr>
<td><em>model</em></td>
<td>The Dakota::Model that will be used by this optimizer for problem information, etc.</td>
</tr>
</tbody>
</table>

References JEGAOptimizer::theEvalCreator, ProblemDescDB::get_int(), ProblemDescDB::get_short(), Iterator-::iteratedModel, JEGAOptimizer::LoadTheParameterDatabase(), Iterator::maxEvalConcurrency, Iterator::methodName, Iterator::numFinalSolutions, and Iterator::probDescDB.

### 13.85.3 Member Function Documentation

**void LoadDakotaResponses ( const JEGA::Utilities::Design & from, Dakota::Variables & vars, Dakota::Response & resp ) const [protected]**

Loads the JEGA-style Design class into equivalent Dakota-style Variables and Response objects.

This version is meant for the case where a Variables and a Response object exist and just need to be loaded.

Parameters

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>from</em></td>
<td>The JEGA Design class object from which to extract the variable and response information for Dakota.</td>
</tr>
<tr>
<td><em>vars</em></td>
<td>The Dakota::Variables object into which to load the design variable values of <em>from</em>.</td>
</tr>
<tr>
<td><em>resp</em></td>
<td>The Dakota::Response object into which to load the objective function and constraint values of <em>from</em>.</td>
</tr>
</tbody>
</table>

References Variables::continuous_variables(), Variables::discrete_int_variables(), Variables::discrete_real_variables(), Variables::discrete_string_variable(), Response::function_values(), and Dakota::set_index_to_value().
void LoadTheParameterDatabase() [protected]

Reads information out of the known Dakota::ProblemDescDB and puts it into the current parameter database. This should be called from the JEGAOptimizer constructor since it is the only time when the problem description database is certain to be configured to supply data for this optimizer. Referenced by JEGAOptimizer::JEGAOptimizer().

void LoadAlgorithmConfig ( JEGA::FrontEnd::AlgorithmConfig & aConfig ) [protected]

Completely initializes the supplied algorithm configuration. This loads the supplied configuration object with appropriate data retrieved from the parameter database.

Parameters

| aConfig | The algorithm configuration object to load. |

void LoadProblemConfig ( JEGA::FrontEnd::ProblemConfig & pConfig ) [protected]

Completely initializes the supplied problem configuration. This loads the fresh configuration object using the LoadTheDesignVariables, LoadTheObjectiveFunctions, and LoadTheConstraints methods.

Parameters

| pConfig | The problem configuration object to load. |

void LoadTheDesignVariables ( JEGA::FrontEnd::ProblemConfig & pConfig ) [protected]

Adds DesignVariableInfo objects into the problem configuration object. This retrieves design variable information from the ParameterDatabase and creates DesignVariableInfo’s from it.

Parameters

| pConfig | The problem configuration object to load. |

References Model::continuous_lower_bounds().

void LoadTheObjectiveFunctions ( JEGA::FrontEnd::ProblemConfig & pConfig ) [protected]

Adds ObjectiveFunctionInfo objects into the problem configuration object. This retrieves objective function information from the ParameterDatabase and creates ObjectiveFunctionInfo’s from it.

Parameters

| pConfig | The problem configuration object to load. |

void LoadTheConstraints ( JEGA::FrontEnd::ProblemConfig & pConfig ) [protected]

Adds ConstraintInfo objects into the problem configuration object. This retrieves constraint function information from the ParameterDatabase and creates ConstraintInfo’s from it.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pConfig</td>
<td>The problem configuration object to load.</td>
</tr>
</tbody>
</table>

References Dakota::asstring(), Dakota::copy_row_vector(), and Model::nonlinear_ineq_constraint_lower_bounds().

void GetBestSolutions ( const JEGA::Utilities::DesignOFSortSet & from, const JEGA::Algorithms::GeneticAlgorithm & theGA, std::multimap<RealRealPair, JEGA::Utilities::Design *> & designSortMap ) [protected]

Returns up to _numBest designs sorted by DAKOTA's fitness (L2 constraint violation, then utopia or objective), taking into account the algorithm type. The front of the returned map can be viewed as a single "best".

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from</td>
<td>The full set of designs returned by the solver.</td>
</tr>
<tr>
<td>theGA</td>
<td>The GA used to generate this set; needed for its weights in the SO case, provided to both for consistency</td>
</tr>
<tr>
<td>designSortMap</td>
<td>Map of best solutions with key pair&lt;constraintViolation, fitness&gt;</td>
</tr>
</tbody>
</table>

eventually this functionality must be moved into a separate post-processing application for MO datasets.

void GetBestMOSolutions ( const JEGA::Utilities::DesignOFSortSet & from, const JEGA::Algorithms::GeneticAlgorithm & theGA, std::multimap<RealRealPair, JEGA::Utilities::Design *> & designSortMap ) [protected]

Retreive the best Designs from a set of solutions assuming that they are generated by a multi objective algorithm.

eventually this functionality must be moved into a separate post-processing application for MO datasets.

void GetBestSOSolutions ( const JEGA::Utilities::DesignOFSortSet & from, const JEGA::Algorithms::GeneticAlgorithm & theGA, std::multimap<RealRealPair, JEGA::Utilities::Design *> & designSortMap ) [protected]

Retreive the best Designs from a set of solutions assuming that they are generated by a single objective algorithm.

eventually this functionality must be moved into a separate post-processing application for MO datasets.

References Dakota::abort_handler().

JEGA::DoubleMatrix ToDoubleMatrix ( const VariablesArray & variables ) const [protected]

Converts the items in a VariablesArray into a DoubleMatrix whereby the items in the matrix are the design variables.

The matrix will not contain responses but when being used by Dakota, this doesn’t matter. JEGA will attempt to re-evaluate these points but Dakota will recognize that they do not require re-evaluation and thus it will be a cheap operation.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variables</td>
<td>The array of DakotaVariables objects to use as the contents of the returned matrix.</td>
</tr>
</tbody>
</table>

Returns

The matrix created using the supplied VariablesArray.
void core_run ( )  [virtual]

Performs the iterations to determine the optimal set of solutions.

Override of pure virtual method in Optimizer base class.

The extraction of parameter values actually occurs in this method when the JEGA::FrontEnd::Driver::Execute-Algorithm is called. Also the loading of the problem and algorithm configurations occurs in this method. That way, if it is called more than once and the algorithm or problem has changed, it will be accounted for.

Reimplemented from Iterator.

References JEGAOptimizer::Driver::DestroyAlgorithm(), JEGAOptimizer::Driver::ExtractAllData(), and JEGAOptimizer::Driver::PerformIterations().

bool accepts_multiple_points ( ) const  [virtual]

Overridden to return true since JEGA algorithms can accept multiple initial points.

Returns

true, always.

Reimplemented from Iterator.

bool returns_multiple_points ( ) const  [virtual]

Overridden to return true since JEGA algorithms can return multiple final points.

Returns

true, always.

Reimplemented from Iterator.

void initial_points ( const VariablesArray & pts )  [virtual]

Overridden to assign the _initPts member variable to the passed in collection of Dakota::Variables.

Parameters

| pts | The array of initial points for the JEGA algorithm created and run by this JEGAOptimizer. |

Reimplemented from Iterator.

const VariablesArray & initial_points ( ) const  [virtual]

Overridden to return the collection of initial points for the JEGA algorithm created and run by this JEGA-Optimizer.

Returns

The collection of initial points for the JEGA algorithm created and run by this JEGAOptimizer.

Reimplemented from Iterator.
13.85.4 Member Data Documentation

VariablesArray_initPts [private]

An array of initial points to use as an initial population.
This member is here to help support the use of JEGA algorithms in Dakota strategies. If this array is populated, then whatever initializer is specified will be ignored and the DoubleMatrix initializer will be used instead on a matrix created from the data in this array.
The documentation for this class was generated from the following files:
- JEGAOptimizer.hpp
- JEGAOptimizer.cpp

13.86 JEGATraits Class Reference

A version of TraitsBase specialized for John Eddy’s Genetic Algorithms (JEGA).
Inheritance diagram for JEGATraits:

```
TraitsBase
\downarrow
JEGATraits
```

Public Member Functions

- JEGATraits ()
  default constructor
- virtual ~JEGATraits ()
  destructor
- virtual bool is_derived ()
  A temporary query used in the refactor.
- bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.
- bool supports_discrete_variables ()
  Return the flag indicating whether method supports discrete variables.
- bool supports_linear_equality ()
  Return the flag indicating whether method supports linear equalities.
- bool supports_linear_inequality ()
  Return the flag indicating whether method supports linear inequalities.
- bool supports_nonlinear_equality ()
  Return the flag indicating whether method supports nonlinear equalities.
- bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear inequalities.
- NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format ()
  Return the format used for nonlinear inequality constraints.
13.86.1 Detailed Description

A version of TraitsBase specialized for John Eddy’s Genetic Algorithms (JEGA).

The documentation for this class was generated from the following file:

- JEGAOptimizer.hpp

13.87 LabelsWriter Class Reference

Utility used in derived write_core to write labels in tabular format.

Public Member Functions

- template<typename ArrayType>
  
  void operator() (std::ostream &s, size_t start_index, size_t num_items, const ArrayType &array_data, StringMultiArrayConstView label_array)

13.87.1 Detailed Description

Utility used in derived write_core to write labels in tabular format.

13.87.2 Member Function Documentation

void operator() ( std::ostream & s, size_t start_index, size_t num_items, const ArrayType & array_data, StringMultiArrayConstView label_array ) [inline]

The tabular labels writer only forwards the label arrays

References Dakota::write_data_partial_tabular().

The documentation for this class was generated from the following file:

- DakotaVariables.hpp

13.88 LeastSq Class Reference

Base class for the nonlinear least squares branch of the iterator hierarchy.

Inheritance diagram for LeastSq:

```
Iterator

Minimizer

LeastSq
```
CHAPTER 13. CLASS DOCUMENTATION

Protected Member Functions

- **LeastSq (std::shared_ptr<TraitsBase> traits)**
  - default constructor
- **LeastSq (ProblemDescDB &problem_db, Model &model, std::shared_ptr<TraitsBase> traits)**
  - standard constructor
- **LeastSq (unsigned short method_name, Model &model, std::shared_ptr<TraitsBase> traits)**
  - alternate "on the fly" constructor
- **~LeastSq ()**
  - destructor
- void initialize_run ()
- void post_run (std::ostream &s)
- void finalize_run ()
  - utility function to perform common operations following post_run(); deallocation and resetting of instance pointers
- void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
- void get_confidence_intervals (const Variables &native_vars, const Response &iter_resp)
  - Calculate confidence intervals on estimated parameters.

Protected Attributes

- size_t numLeastSqTerms
  - number of least squares terms
- LeastSq * prevLSqInstance
  - pointer containing previous value of leastSqInstance
- bool weightFlag
  - flag indicating whether weighted least squares is active
- RealVector confBoundsLower
  - lower bounds for confidence intervals on calibration parameters
- RealVector confBoundsUpper
  - upper bounds for confidence intervals on calibration parameters
- RealVector bestIterPriFns
  - storage for iterator best primary functions (which shouldn’t be stored in bestResponseArray when there are transformations)
- bool retrievedIterPriFns
  - whether final primary iterator space functions have been retrieved (possibly by a derived class)

Static Protected Attributes

- static LeastSq * leastSqInstance
  - pointer to LeastSq instance used in static member functions

Private Member Functions

- void weight_model ()
  - Wrap iteratedModel in a RecastModel that weights the residuals.
- void archive_best_results ()
  - top-level archival method
Additional Inherited Members

13.88.1 Detailed Description

Base class for the nonlinear least squares branch of the iterator hierarchy.

The LeastSq class provides common data and functionality for least squares solvers (including NL2OL, NLSSOLLeastSq, and SNLLLeastSq).

13.88.2 Constructor & Destructor Documentation

LeastSq ( ProblemDescDB & problem_db, Model & model, std::shared_ptr<TraitsBase> traits )
[protected]

standard constructor

This constructor extracts the inherited data for the least squares branch and performs sanity checking on gradient and constraint settings.

References Dakota::abort_handler(), Iterator::bestVariablesArray, Minimizer::calibrationDataFlag, Variables::copy(), Model::current_variables(), Minimizer::data_transform_model(), Iterator::iteratedModel, Iterator::methodName, LeastSq::numLeastSqTerms, Minimizer::numTotalCalibTerms, Minimizer::optimizationFlag, Model::primary_fn_type(), Minimizer::scale_model(), Minimizer::scaleFlag, LeastSq::weight_model(), and LeastSq::weightFlag.

13.88.3 Member Function Documentation

void initialize_run ( ) [protected], [virtual]

This function should be invoked (or reimplemented) by any derived implementations of initialize_run() (which would otherwise hide it).

Reimplemented from Iterator.

References LeastSq::bestIterPriFns, Minimizer::initialize_run(), Iterator::iteratedModel, LeastSq::leastSqInstance, Iterator::myModelLayers, LeastSq::prevLSqInstance, LeastSq::retrievedIterPriFns, and Model::update_from_subordinate_model().

void post_run ( std::ostream & s ) [protected], [virtual]

Implements portions of post_run specific to LeastSq for scaling back to native variables and functions. This function should be invoked (or reimplemented) by any derived implementations of post_run() (which would otherwise hide it).

Reimplemented from Iterator.

References Dakota::abort_handler(), Iterator::activeSet, LeastSq::bestIterPriFns, Iterator::bestResponseArray, Iterator::bestVariablesArray, Minimizer::calibrationDataFlag, Variables::continuous_variables(), Model::continuous_variables(), Response::copy(), Variables::copy(), Dakota::copy_data_partial(), Model::current_response(), ScalingModel::cv_scaled2native(), Model::db_lookup(), Model::evaluate(), Response::function_gradients(), Response::function_values(), Response::function_values_view(), LeastSq::get_confidence_intervals(), Iterator::iteratedModel, Model::model_rep(), Minimizer::numContinuousVars, LeastSq::numLeastSqTerms, Minimizer::numNonlinearConstraints, Minimizer::numUserPrimaryFns, Minimizer::original_model(), Iterator::outputLevel, Minimizer::post_run(), ActiveSet::request_value(), ActiveSet::request_values(), ActiveSet::request_vector(), LeastSq::retrievedIterPriFns, Minimizer::scaleFlag, Minimizer::scalingModel, Minimizer::vendorNumericalGradFlag, and LeastSq::weightFlag.

void finalize_run ( ) [inline], [protected], [virtual]

utility function to perform common operations following post_run(); deallocation and resetting of instance pointers
Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent's finalize_run(), typically after performing its own implementation steps.

Reimplemented from Iterator.

References Minimizer::finalize_run(), LeastSq::leastSqInstance, and LeastSq::prevLSqInstance.

```cpp
void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
```

Redefines default iterator results printing to include nonlinear least squares results (residual terms and constraints).

Reimplemented from Iterator.

References Iterator::activeSet, Iterator::bestResponseArray, Iterator::bestVariablesArray, Minimizer::calibrationDataFlag, LeastSq::confBoundsLower, LeastSq::confBoundsUpper, ExperimentData::config_vars(), Model::continuous_variable_labels(), Dakota::data_pairs, Minimizer::dataTransformModel, Minimizer::expData, Model::interface_id(), Iterator::iteratedModel, Dakota::lookup_by_val(), Model::model_rep(), ExperimentData::num_experiments(), Minimizer::numContinuousVars, Minimizer::numNonlinearConstraints, Minimizer::numUserPrimaryFns, Minimizer::original_model(), DataTransformModel::print_best_responses(), Minimizer::print_residuals(), ActiveSet::request_values(), Model::response_size(), Minimizer::scaleFlag, LeastSq::weightFlag, Variables::write(), Dakota::write_data_partial(), and Dakota::write_precision.

```cpp
void get_confidence_intervals ( const Variables & native_vars, const Response & iterresp ) [protected]
```

Calculate confidence intervals on estimated parameters.

Calculate individual confidence intervals for each parameter, based on a linear approximation of the nonlinear model. native_cv are needed for transformations and final reporting. iterresp must contain the final differenced, scaled, weighted residuals and gradients.

References LeastSq::confBoundsLower, LeastSq::confBoundsUpper, Variables::continuous_variables(), Response::copy(), Response::function_gradients_view(), Response::function_values(), Model::model_rep(), Minimizer::numContinuousVars, LeastSq::numLeastSqTerms, ScalingModel::response_modify_s2n(), Minimizer::scaleFlag, Minimizer::scalingModel, and Minimizer::vendorNumericalGradFlag.

Referenced by LeastSq::post_run().

```cpp
void weight_model ( ) [private]
```

Wrap iteratedModel in a RecastModel that weights the residuals.

Setup Recast for weighting model. The weighting transformation doesn’t resize, and makes no vars, active set or secondary mapping. All indices are one-to-one mapped (no change in counts).

References Dakota::abort_handler(), Model::assign_rep(), Iterator::iteratedModel, Iterator::myModelLayers, Iterator::outputLevel, and Model::primary_response_fn_weights().

Referenced by LeastSq::LeastSq().

The documentation for this class was generated from the following files:

- DakotaLeastSq.hpp
- DakotaLeastSq.cpp

### 13.89 LibraryEnvironment Class Reference

**Environment** corresponding to execution as an embedded library.

Inheritance diagram for LibraryEnvironment:
Public Member Functions

- **LibraryEnvironment ()**
  
  *default constructor*

- **LibraryEnvironment (ProgramOptions prog_opts, bool check_bcast_construct=true, DbCallbackFunctionPtr callback=NULL, void *callback_data=NULL)*

  *Primary constructor: program options typically specifies an input file or input string. Optionally specify a callback function to be invoked after parsing. Set check_bcast_construct if performing late updates and later calling done_modifying_db().*

- **LibraryEnvironment (MPI_Comm dakota_mpi_comm, ProgramOptions prog_opts=ProgramOptions(), bool check_bcast_construct=true, DbCallbackFunctionPtr callback=NULL, void *callback_data=NULL)*

  *Alternate constructor accepting communicator, same options as primary.*

- **~LibraryEnvironment ()**

  *destructor*

- **void insert_nodes (Dakota::DataMethod &dme, Dakota::DataModel &dmo, Dakota::DataVariables &dv, Dakota::DataInterface &di, Dakota::DataResponses &dr)*

  *Insert DB nodes for a \{Method,Model,Variables,Interface,Responses\} set.*

- **void done_modifying_db ()**

  *Check database contents, broadcast, and construct iterators.*

- **bool plugin_interface (const String &model_type, const String &interf_type, const String &an_driver, Interface *plugin_iface)*

  *Plug-in the passed interface into any interface matching the specified (possibly empty) model, interface, and driver strings; returns true if a plugin was performed.*

- **InterfaceList filtered_interface_list (const String &interf_type, const String &an_driver)*

  *filter the available Interface instances based on matching interface type and analysis drivers (empty String matches any)*

- **ModelList filtered_model_list (const String &model_type, const String &interf_type, const String &an_driver)*

  *filter the available Model instances based on matching model type, interface type, and analysis drivers (empty String matches any)*

Additional Inherited Members

13.89.1 Detailed Description

**Environment** corresponding to execution as an embedded library.

This environment corresponds to use of Dakota as a library within another application, e.g., within library_mode.cpp. It sets up the ParallelLibrary and ProblemDescDB objects without access to command line arguments.
13.89.2 Constructor & Destructor Documentation

LibraryEnvironment ( ProgramOptions prog_opt, bool check_bcast_construct = true, DbCallbackFunctionPtr callback = NULL, void * callback_data = NULL )

Primary constructor: program options typically specifies an input file or input string. Optionally specify a callback function to be invoked after parsing. Set check_bcast_construct if performing late updates and later calling done_modifying_db().

Construct library environment, optionally performing check/bcast of database and iterator construction

References Environment::construct(), OutputManager::output_startup_message(), Environment::outputManager, and Environment::parse().

LibraryEnvironment ( MPI_Comm dakota_mpi_comm, ProgramOptions prog_opt = ProgramOptions (), bool check_bcast_construct = true, DbCallbackFunctionPtr callback = NULL, void * callback_data = NULL )

Alternate constructor accepting communicator, same options as primary.

Construct library environment on passed MPI Comm, optionally performing check/bcast of database and iterator construction. MPI Comm is first argument so client doesn’t have to pass all args

References Environment::construct(), OutputManager::output_startup_message(), Environment::outputManager, and Environment::parse().

13.89.3 Member Function Documentation

InterfaceList filtered_interface_list ( const String & interf_type, const String & an_driver )

filter the available Interface instances based on matching interface type and analysis drivers (empty String matches any)

This convenience function helps clients locate and plugin to the right Interface instance for simple cases. Pass an empty string to match any instead of a specific instance

References Interface::analysis_drivers(), Dakota::contains(), Interface::interface_type(), ProblemDescDB::model_list(), and Environment::probDescDB.

ModelList filtered_model_list ( const String & model_type, const String & interf_type, const String & an_driver )

filter the available Model instances based on matching model type, interface type, and analysis drivers (empty String matches any)

This convenience function helps clients locate and plugin to the right Interface instance for cases where the parallel configuration is needed in constructing a parallel plugin. Pass an empty string to match any instead of a specific instance

References Interface::analysis_drivers(), Dakota::contains(), Interface::interface_type(), ProblemDescDB::model_list(), and Environment::probDescDB.

Referenced by parallel_interface_plugin(), LibraryEnvironment::plugin_interface(), run_dakota(), and run_dakota_mixed().

- LibraryEnvironment.hpp
- LibraryEnvironment.cpp
13.90 LightWtBaseConstructor Struct Reference

Dummy struct for overloading constructors used in on-the-fly Model instantiations.

Public Member Functions

- **LightWtBaseConstructor (int=0)**
  
  C++ structs can have constructors.

13.90.1 Detailed Description

Dummy struct for overloading constructors used in on-the-fly Model instantiations. LightWtBaseConstructor is used to overload the constructor used for on-the-fly Model instantiations. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- dakota.global.defs.hpp

13.91 MatchesWC Struct Reference

Predicate that returns true when the passed path matches the wildcard with which it was configured. Currently supports * and ?.

Public Member Functions

- **MatchesWC (const bfs::path &wild_card)**

  Ctor that builds and stores the regular expression

- **bool operator() (const bfs::path &dir_entry)**

  Return true is dir_entry matches wildCardRegEx

Public Attributes

- boost::basic_regex

  `<bfs::path::value_type>` **wildCardRegEx**

  archived RegEx; wchar-based on Windows

13.91.1 Detailed Description

Predicate that returns true when the passed path matches the wildcard with which it was configured. Currently supports * and ?.

The documentation for this struct was generated from the following file:

- WorkdirHelper.hpp
13.92 MatlabInterface Class Reference

Inheritance diagram for MatlabInterface:

```
Interface
   ApplicationInterface
      DirectApplicInterface
         MatlabInterface
```

Public Member Functions

- **MatlabInterface** (const ProblemDescDB &problem_db)
  
  Constructor: start Matlab engine.

- **~MatlabInterface ()**
  
  Destructor: close Matlab engine.

Protected Member Functions

- virtual int derived_map_ac (const String &ac_name)
  
  execute an analysis code portion of a direct evaluation invocation

- int matlab_engine_run (const Dakota::String &ac_name)
  
  Helper function supporting derived_map_ac. Sends data to Matlab, executes analysis, collects return data.

- int matlab_field_prep (mxArray *dakota_matlab, const char *field_name)

  check that the dakota_matlab structure has the specified field_name and add if necessary; free structure memory in preparation for new alloc

Protected Attributes

- engine * matlabEngine

  pointer to the MATLAB engine used for direct evaluations

13.92.1 Detailed Description

Specialization of DirectApplicInterface to link to Matlab analysis drivers. Includes convenience functions to map data to/from Matlab

13.92.2 Member Function Documentation

```
int derived_map_ac ( const String & ac_name ) [protected], [virtual]
```

execute an analysis code portion of a direct evaluation invocation

  Matlab specialization of derived analysis components.
Reimplemented from DirectApplicInterface.
References ApplicationInterface::analysisServerId, and MatlabInterface::matlab_engine_run().

```
int matlab_engine_run ( const Dakota::String & ac_name ) [protected]
```

Helper function supporting derived_map_ac. Sends data to Matlab, executes analysis, collects return data.
Direct interface to Matlab through Mathworks external API. m-file executed is specified through analysis_drivers, extra strings through analysis_components. (Original BMA 11/28/2005)
Special thanks to Lee Peterson for substantial enhancements 12/15/2007: Added output buffer for the M-ATLAB command response and error messages Made the Dakota variable persistent in the MATLAB engine workspace Added robustness to the user deleting required Dakota fields
References Dakota::abort_handler(), Interface::analysisComponents, DirectApplicInterface::analysisDriverIndex, Interface::currEvalId, DirectApplicInterface::directFnASV, DirectApplicInterface::directFnDVV, Dakota::FIELD_NAMES, DirectApplicInterface::fnGrads, DirectApplicInterface::fnHessians, Interface::fnLabels, DirectApplicInterface::fnVals, DirectApplicInterface::gradFlag, DirectApplicInterface::hessFlag, MatlabInterface::matlab_field_prep(), MatlabInterface::matlabEngine, DirectApplicInterface::numACV, DirectApplicInterface::numADIV, DirectApplicInterface::numADRV, Dakota::NUMBER_OF_FIELDS, DirectApplicInterface::numDerivVars, DirectApplicInterface::numFns, DirectApplicInterface::numVars, Interface::outputLevel, DirectApplicInterface::x, DirectApplicInterface::xCLabels, DirectApplicInterface::xDI, DirectApplicInterface::xDILabels, DirectApplicInterface::xDR, and DirectApplicInterface::xDRLabels.

### 13.93 MetaIterator Class Reference

Base class for meta-iterators.

Inheritance diagram for MetaIterator:

![Inheritance Diagram](image)

**Public Member Functions**

- `bool resize ()`

  *reinitializes iterator based on new variable size*

**Protected Member Functions**

- `MetaIterator (ProblemDescDB &problem_db)`

  *standard constructor*

- `MetaIterator (ProblemDescDB &problem_db, Model &model)`
alternate constructor

- MetaIterator ()

destructor

- void post_run (std::ostream &s)
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

- void check_model (const String &method_ptr, const String &model_ptr)
  check that a model identified by pointer has the same id as the iteratedModel passed through the ctor chain

- void allocate_by_pointer (const String &method_ptr, Iterator &the_iterator, Model &the_model)
  initialize the_iterator and the_model based on method_ptr

- void allocate_by_name (const String &method_string, const String &model_ptr, Iterator &the_iterator, Model &the_model)
  initialize the_iterator based on method_string

- std::pair<int, int> estimate_by_pointer (const String &method_ptr, Iterator &the_iterator, Model &the_model)
  estimate minimum and maximum processors per iterator needed for init iteration parallelism(); instantiates the_iterator and the_model as needed, but on minimal processor ranks (is later augmented by allocate_by_pointer())

- std::pair<int, int> estimate_by_name (const String &method_string, const String &model_ptr, Iterator &the_iterator, Model &the_model)
  estimate minimum and maximum processors per iterator needed for init iteration parallelism(); instantiates the_iterator and the_model as needed, but on minimal processor ranks (is later augmented by allocate_by_name())

Protected Attributes

- IteratorScheduler iterSched
  scheduler for concurrent execution of Iterators

- int maxIteratorConcurrency
  maximum number of concurrent sub-iterator executions

Additional Inherited Members

13.93.1 Detailed Description

Base class for meta-iterators.
This base class shares code for concurrent and hybrid meta-iterators, where the former supports multi-start and Pareto set iteration and the latter supports sequential, embedded, and collaborative hybrids.

13.93.2 Member Function Documentation

void post_run ( std::ostream & s ) [protected], [virtual]

post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way.

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically after performing its own implementation steps.

Reimplemented from Iterator.

References MetaIterator::iterSched, IteratorScheduler::lead_rank(), and Iterator::print_results().

The documentation for this class was generated from the following files:
13.94 Minimizer Class Reference

Base class for the optimizer and least squares branches of the iterator hierarchy.

Inheritance diagram for Minimizer:

```
Itrator
    Minimizer
    LeastSq
    Optimizer
        JEGAOptimizer
        NonlinearCGOptimizer
        NOWPACOptimizer
        OptDartsOptimizer
        ROLOptimizer
        EffGlobalMinimizer
        SurrBasedGlobalMinimizer
        SurrBasedLocalMinimizer
```

Public Member Functions

- void constraint_tolerance (Real constr_tol)
  set the method constraint tolerance (constraintTol)

- Real constraint_tolerance () const
  return the method constraint tolerance (constraintTol)

- bool resize ()
  reinitializes iterator based on new variable size

Static Public Member Functions

- static Real sum_squared_residuals (size_t num_pri_fns, const RealVector &residuals, const RealVector &weights)
  return weighted sum of squared residuals

- static void print_residuals (size_t num_terms, const RealVector &best_terms, const RealVector &weights, size_t num_best, size_t best_index, std::ostream &os)
  print num_terms residuals and misfit for final results

- static void print_model_resp (size_t num_pri_fns, const RealVector &best_fns, size_t num_best, size_t best_index, std::ostream &os)
  print the original user model resp in the case of data transformations

Protected Member Functions

- Minimizer (std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>(new TraitsBase()))
  default constructor
CHAPTER 13. CLASS DOCUMENTATION

- **Minimizer** (ProblemDescDB &problem_db, Model &model, std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>(new TraitsBase()))
  
  standard constructor

- **Minimizer** (unsigned short method_name, Model &model, std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>(new TraitsBase()))
  
  alternate constructor for "on the fly" instantiations

- **Minimizer** (unsigned short method_name, size_t num_lin_ineq, size_t num_lin_eq, size_t num_nln_ineq, size_t num_nln_eq, std::shared_ptr<TraitsBase> traits=std::shared_ptr<TraitsBase>(new TraitsBase()))
  
  alternate constructor for "on the fly" instantiations

- **~Minimizer** ()
  
  destructor

- void **update_from_model** (const Model &model)
  
  set inherited data attributes based on extractions from incoming model

- void **initialize_run** ()
  
  utility function to perform common operations prior to pre_run(); typically memory initialization; setting of instance pointers

- void **post_run** (std::ostream &s)
  
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

- void **finalize_run** ()
  
  utility function to perform common operations following post_run(); deallocation and resetting of instance pointers

- const Model & **algorithm_space_model** () const

- Model original_model (unsigned short recasts_left=0) const
  
  Return a shallow copy of the original model this Iterator was originally passed, optionally leaving recasts_left on top of it.

- void **data_transform_model** ()
  
  Wrap iteratedModel in a RecastModel that subtracts provided observed data from the primary response functions (variables and secondary responses are unchanged)

- void **scale_model** ()
  
  Wrap iteratedModel in a RecastModel that performs variable and/or response scaling.

- Real **objective** (const RealVector &fn_vals, const BoolDeque &max_sense, const RealVector &primary_wts) const
  
  compute a composite objective value from one or more primary functions

- Real **objective** (const RealVector &fn_vals, size_t num_fns, const BoolDeque &max_sense, const RealVector &primary_wts) const
  
  compute a composite objective with specified number of source primary functions, instead of userPrimaryFns

- void **objective_gradient** (const RealVector &fn_vals, const RealMatrix &fn_grads, const BoolDeque &max_sense, const RealVector &primary_wts, RealVector &obj_grad) const
  
  compute the gradient of the composite objective function

- void **objective_gradient** (const RealVector &fn_vals, size_t num_fns, const RealMatrix &fn_grads, const BoolDeque &max_sense, const RealVector &primary_wts, RealVector &obj_grad) const
  
  compute the gradient of the composite objective function

- void **objective_hessian** (const RealVector &fn_vals, const RealMatrix &fn_grads, const RealSymMatrix<Array &fn_hessians, const BoolDeque &max_sense, const RealVector &primary_wts, RealSymMatrix &obj_hess) const
  
  compute the gradient of the composite objective function
compute the Hessian of the composite objective function

- `void objective_hessian` (const `RealVector` &`fn_vals`, `size_t` num_fns, const `RealMatrix` &`fn_grads`, const `RealSymMatrixArray` &`fn_hessians`, const `BoolDeque` &max_sense, const `RealVector` &primary_wts, `RealSymMatrix` &obj_hess) const
  
  compute the Hessian of the composite objective function

- `virtual void archive_best_results` ()
  
  top-level archival method

- `void archive_best_variables` (const bool active_only=false) const
  
  archive best variables for the index'th final solution

- `void archive_best_objective_functions` () const
  
  archive the index'th set of objective functions

- `void archive_best_constraints` () const
  
  archive the index'th set of constraints

- `void archive_best_residuals` () const
  
  Archive residuals when calibration terms are used.

- `void resize_best_vars_array` (`size_t` newsize)
  
  Safely resize the best variables array to newsize taking into account the envelope-letter design pattern and any recasting.

- `void resize_best_resp_array` (`size_t` newsize)
  
  Safely resize the best response array to newsize taking into account the envelope-letter design pattern and any recasting.

- `void local_recast_retrieve` (const `Variables` &vars, `Response` &response) const
  
  infers MOO/NLS solution from the solution of a single-objective optimizer

### Protected Attributes

- `size_t numFunctions`
  
  number of response functions

- `size_t numContinuousVars`
  
  number of active continuous vars

- `size_t numDiscreteIntVars`
  
  number of active discrete integer vars

- `size_t numDiscreteStringVars`
  
  number of active discrete string vars

- `size_t numDiscreteRealVars`
  
  number of active discrete real vars

- `Real constraintTol`
  
  optimizer/least squares constraint tolerance

- `Real bigRealBoundSize`
  
  cutoff value for inequality constraint and continuous variable bounds

- `int bigIntBoundSize`
  
  cutoff value for discrete variable bounds

- `size_t numNonlinearIneqConstraints`
  
  number of nonlinear inequality constraints
• `size_t numNonlinearEqConstraints`
  number of nonlinear equality constraints

• `size_t numLinearIneqConstraints`
  number of linear inequality constraints

• `size_t numLinearEqConstraints`
  number of linear equality constraints

• `size_t numNonlinearConstraints`
  total number of nonlinear constraints

• `size_t numLinearConstraints`
  total number of linear constraints

• `size_t numConstraints`
  total number of linear and nonlinear constraints

• `bool optimizationFlag`
  flag for use where optimization and NLS must be distinguished

• `size_t numUserPrimaryFns`
  number of objective functions or least squares terms in the inbound model; always initialize at `Minimizer`, even if overridden later

• `size_t numIterPrimaryFns`
  number of objective functions or least squares terms in iterator’s view, after transformations; always initialize at `Minimizer`, even if overridden later

• `bool boundConstraintFlag`
  convenience flag for denoting the presence of user-specified bound constraints. Used for method selection and error checking.

• `bool speculativeFlag`
  flag for speculative gradient evaluations

• `bool calibrationDataFlag`
  flag indicating whether user-supplied calibration data is active

• `ExperimentData expData`
  Container for experimental data to which to calibrate model using least squares or other formulations which minimize SSE.

• `size_t numExperiments`
  number of experiments

• `size_t numTotalCalibTerms`
  number of total calibration terms (sum over experiments of number of experimental data per experiment, including field data)

• `Model dataTransformModel`
  Shallow copy of the data transformation model, when present (cached in case further wrapped by other transformations)

• `bool scaleFlag`
  whether Iterator-level scaling is active

• `Model scalingModel`
  Shallow copy of the scaling transformation model, when present (cached in case further wrapped by other transformations)

• `Minimizer * prevMinInstance`
pointer containing previous value of minimizerInstance

- bool vendorNumericalGradFlag
  convenience flag for gradient_type == numerical && method_source == vendor

**Static Protected Attributes**

- static Minimizer * minimizerInstance
  pointer to Minimizer used in static member functions

**Friends**

- class SOLBase
  the SOLBase class is not derived the iterator hierarchy but still needs access to iterator hierarchy data (to avoid attribute replication)

- class SNLLBase
  the SNLLBase class is not derived the iterator hierarchy but still needs access to iterator hierarchy data (to avoid attribute replication)

**Additional Inherited Members**

**13.94.1 Detailed Description**

Base class for the optimizer and least squares branches of the iterator hierarchy.

The Minimizer class provides common data and functionality for Optimizer and LeastSq.

**13.94.2 Constructor & Destructor Documentation**

Minimizer ( ProblemDescDB & problem_db, Model & model, std::shared_ptr<TraitsBase> traits = std::shared_ptr<TraitsBase>(new TraitsBase()) ) [protected]

standard constructor

This constructor extracts inherited data for the optimizer and least squares branches and performs sanity checking on constraint settings.

References Iterator::iteratedModel, Iterator::maxIterations, Iterator::methodName, Iterator::numFinalSolutions, and Minimizer::update_from_model().

**13.94.3 Member Function Documentation**

void initialize_run( ) [protected], [virtual]

utility function to perform common operations prior to pre_run(); typically memory initialization; setting of instance pointers

Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically before performing its own implementation steps.

Reimplemented from Iterator.

Reimplemented in Optimizer, and ROLOptimizer.

References Model::all_continuous_variables(), Model::all_discrete_int_variables(), Model::all_discrete_real_variables(), Iterator::bestVariablesArray, Model::initialize_mapping(), Model::is_null(), Iterator::iteratedModel, Model::mapping_initialized(), Iterator::methodPCIter, Minimizer::minimizerInstance, Iterator::myModelLayers,
Minimizer::prevMinInstance, Minimizer::resize(), Model::set_evaluation_reference(), Iterator::subIteratorFlag, Model::subordinate_model(), and Iterator::summaryOutputFlag.
    Referenced by LeastSq::initialize_run(), and Optimizer::initialize_run().

void post_run ( std::ostream & s ) [protected], [virtual]
post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way
    Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s post_run(), typically after performing its own implementation steps.
    Reimplemented from Iterator.
    Reimplemented in Optimizer, and SurrBasedLocalMinimizer.
    References Minimizer::archive_best_results(), Model::is_null(), Iterator::iteratedModel, Model::print_evaluation_summary(), Iterator::print_results(), and Iterator::summaryOutputFlag.
    Referenced by LeastSq::post_run(), SurrBasedLocalMinimizer::post_run(), and Optimizer::post_run().

void finalize_run ( ) [protected], [virtual]
utility function to perform common operations following post_run(); deallocation and resetting of instance pointers
    Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically after performing its own implementation steps.
    Reimplemented from Iterator.
    Reimplemented in Optimizer.
    References Model::finalize_mapping(), Iterator::finalize_run(), Iterator::iteratedModel, Model::mapping_initialized(), Minimizer::minimizerInstance, Minimizer::prevMinInstance, and Minimizer::resize().
    Referenced by LeastSq::finalize_run(), and Optimizer::finalize_run().

const Model & algorithm_space_model ( ) const [inline], [protected], [virtual]
default definition that gets redefined in selected derived Minimizers
    Reimplemented from Iterator.
    Reimplemented in EffGlobalMinimizer.
    References Iterator::iteratedModel.

void data_transform_model ( ) [protected]
Wrap iteratedModel in a RecastModel that subtracts provided observed data from the primary response functions (variables and secondary responses are unchanged)
    Reads observation data to compute least squares residuals. Does not change size of responses, and is the first wrapper, therefore sizes are based on iteratedModel.
    References Dakota::abort_handler(), Iterator::activeSet, Iterator::assign_rep(), Minimizer::dataTransformModel, Minimizer::expData, ProblemDescDB::get_sizet(), Iterator::iteratedModel, ExperimentData::load_data(), Iterator::myModelLayers, Model::num_primary_fns(), Minimizer::numExperiments, Minimizer::numFunctions, Minimizer::numIterPrimaryFns, Minimizer::numTotalCalibTerms, Iterator::outputLevel, Iterator::probDescDB, ActiveSet::request_vector(), and Model::response_size().
    Referenced by LeastSq::LeastSq(), and Optimizer::Optimizer().
void scale_model() [protected]

Wrap iteratedModel in a RecastModel that performs variable and/or response scaling.
- Wrap the iteratedModel in a scaling transformation, such that iteratedModel now contains a scaling recast model. Potentially affects variables, primary, and secondary responses
- References Model::assign_rep(), Iterator::iteratedModel, Iterator::myModelLayers, and Minimizer::scalingModel.
- Referenced by LeastSq::LeastSq(), and Optimizer::Optimizer().

Real objective ( const RealVector & fn_vals, const BoolDeque & max_sense, const RealVector & primary_wts ) const [protected]

compute a composite objective value from one or more primary functions
- The composite objective computation sums up the contributions from one of more primary functions using the primary response fn weights.
- References Minimizer::numUserPrimaryFns.
- Referenced by SurrBasedLocalMinimizer::approx_subprob_objective_eval(), SurrBasedMinimizer::augmented_lagrangian_merit(), SurrBasedLocalMinimizer::compute_trust_region_ratio(), EffGlobalMinimizer::expected_improvement(), SurrBasedMinimizer::initialize_filter(), SurrBasedMinimizer::lagrangian_merit(), Optimizer::objective_reduction(), SurrBasedMinimizer::penalty_merit(), SurrBasedMinimizer::update_filter(), and SurrBasedLocalMinimizer::update_penalty().

Real objective ( const RealVector & fn_vals, size_t num_fns, const BoolDeque & max_sense, const RealVector & primary_wts ) const [protected]

compute a composite objective with specified number of source primary functions, instead of userPrimaryFns
- This "composite" objective is a more general case of the previous objective(), but doesn't presume a reduction map from user to iterated space. Used to apply weights and sense in COLIN results sorting. Leaving as a duplicate implementation pending resolution of COLIN lookups.
- References Minimizer::optimizationFlag.

void objective_gradient ( const RealVector & fn_vals, size_t num_fns, const RealMatrix & fn_grads, const BoolDeque & max_sense, const RealVector & primary_wts, RealVector & obj_grad ) const [protected]

compute the gradient of the composite objective function
- The composite objective gradient computation combines the contributions from one of more primary function gradients, including the effect of any primary function weights. In the case of a linear mapping (MOO), only the primary function gradients are required, but in the case of a nonlinear mapping (NLS), primary function values are also needed. Within RecastModel::set_mapping(), the active set requests are automatically augmented to make values available when needed, based on nonlinearRespMapping settings.
- References Minimizer::numContinuousVars, and Minimizer::optimizationFlag.

void objective_hessian ( const RealVector & fn_vals, size_t num_fns, const RealMatrix & fn_grads, const RealSymMatrixArray & fn_hessians, const BoolDeque & max_sense, const RealVector & primary_wts, RealSymMatrix & obj_hess ) const [protected]

compute the Hessian of the composite objective function
- The composite objective Hessian computation combines the contributions from one of more primary function Hessians, including the effect of any primary function weights. In the case of a linear mapping (MOO), only the primary function Hessians are required, but in the case of a nonlinear mapping (NLS), primary function values...
and gradients are also needed in general (gradients only in the case of a Gauss-Newton approximation). Within the default RecastModel::set_mapping(), the active set requests are automatically augmented to make values and gradients available when needed, based on nonlinearRespMapping settings.

References Dakota::abort_handler(), Minimizer::numContinuousVars, and Minimizer::optimizationFlag.

void resize_best_vars_array ( size_t newsize ) [protected]

Safely resize the best variables array to newsize taking into account the envelope-letter design pattern and any recasting.

Uses data from the innermost model, should any Minimizer recasts be active. Called by multipoint return solvers. Do not directly call resize on the bestVariablesArray object unless you intend to share the internal content (letter) with other objects after assignment.

References Iterator::bestVariablesArray, Variables::copy(), Model::current_variables(), and Minimizer::original_model().

void resize_best_resp_array ( size_t newsize ) [protected]

Safely resize the best response array to newsize taking into account the envelope-letter design pattern and any recasting.

Uses data from the innermost model, should any Minimizer recasts be active. Called by multipoint return solvers. Do not directly call resize on the bestResponseArray object unless you intend to share the internal content (letter) with other objects after assignment.

References Iterator::bestResponseArray, Response::copy(), Model::current_response(), and Minimizer::original_model().

void local_recast_retrieve ( const Variables & vars, Response & response ) const [protected]

infers MOO/NLS solution from the solution of a single-objective optimizer

Retrieve a MOO/NLS response based on the data returned by a single objective optimizer by performing a data_pairs search. This may get called even for a single user-specified function, since we may be recasting a single NLS residual into a squared objective. Always returns best data in the space of the original inbound Model.

References Response::active_set(), Dakota::data_pairs, Model::interface_id(), Iterator::iteratedModel, Dakota::lookup_by_val(), and Response::update().

Referenced by Minimizer::archive_best_results(), and Optimizer::post_run().

The documentation for this class was generated from the following files:

- DakotaMinimizer.hpp
- DakotaMinimizer.cpp

13.95 MixedVarConstraints Class Reference

Derived class within the Constraints hierarchy which separates continuous and discrete variables (no domain type array merging).

Inheritance diagram for MixedVarConstraints:

```
  Constraints
  |          |
  +----------+
  |          |
  +----------+

  MixedVarConstraints
```
Public Member Functions

- MixedVarConstraints (const SharedVariablesData &svd)
  lightweight constructor
- MixedVarConstraints (const ProblemDescDB &problem_db, const SharedVariablesData &svd)
  standard constructor
- ~MixedVarConstraints ()
  destructor
- void write (std::ostream &s) const
  write a variable constraints object to an std::ostream
- void read (std::istream &s)
  read a variable constraints object from an std::istream

Additional Inherited Members

13.95.1 Detailed Description

Derived class within the Constraints hierarchy which separates continuous and discrete variables (no domain type array merging).

Derived variable constraints classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The MixedVarConstraints derived class separates the continuous and discrete domain types (see Variables::get_variables(problem_db) for variables type selection; variables type is passed to the Constraints constructor in Model).

13.95.2 Constructor & Destructor Documentation

MixedVarConstraints ( const ProblemDescDB & problem_db, const SharedVariablesData & svd )

standard constructor

In this class, mixed continuous/discrete variables are used. Most iterators/strategies use this approach, which is the default in Constraints::get_constraints().

References Constraints::allContinuousLowerBnds, Constraints::allContinuousUpperBnds, Constraints::allDiscrete-IntLowerBnds, Constraints::allDiscreteIntUpperBnds, Constraints::allDiscreteRealLowerBnds, Constraints::allDiscreteRealUpperBnds, Dakota::copy_data_partial(), ProblemDescDB::get_iv(), ProblemDescDB::get_rv(), Constraints::sharedVarsData, and SharedVariablesData::view().

The documentation for this class was generated from the following files:

- MixedVarConstraints.hpp
- MixedVarConstraints.cpp

13.96 MixedVariables Class Reference

Derived class within the Variables hierarchy which separates continuous and discrete variables (no domain type array merging).

Inheritance diagram for MixedVariables:
CHAPTER 13. CLASS DOCUMENTATION

Public Member Functions

- **MixedVariables** (const ProblemDescDB &problem_db, const std::pair< short, short > &view)
  *standard constructor*
- **MixedVariables** (const SharedVariablesData &svd)
  *lightweight constructor*
- **\~MixedVariables** ()
  *destructor*

Protected Member Functions

- void **read** (std::istream &s)
  *read a variables object from an std::istream*
- void **write** (std::ostream &s, unsigned short vars_part=ALL_VARS) const
  *write a variables object to an std::ostream, e.g., the console, optionally specifying which partition (all/active/inactive)*
- void **write_aprepro** (std::ostream &s) const
  *write a variables object to an std::ostream in aprepro format, e.g., a parameters file*
- void **write_tabular** (std::ostream &s, unsigned short vars_part=ALL_VARS)
  *write a variables object in tabular format to an std::ostream, optionally specifying which partition (all/active/inactive)*
- void **write_tabular_labels** (std::ostream &s, unsigned short vars_part=ALL_VARS) const
  *write the labels in input spec order to a std::ostream, optionally specifying which partition (all/active/inactive)*
- template<typename Reader>
  void **read_core** (std::istream &s, Reader read_handler, unsigned short vars_part)
  *Implementation of reading various formats using the specified read handler.*
- template<typename Writer>
  void **write_core** (std::ostream &s, Writer write_handler, unsigned short vars_part) const
  *Implementation of writing various formats using the specified write handler.*

Additional Inherited Members

13.96.1 Detailed Description

Derived class within the Variables hierarchy which separates continuous and discrete variables (no domain type array merging).

Derived variables classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The MixedVariables derived class separates the continuous and discrete domain types (see Variables::get_variables(problem_db)).
13.97 Model Class Reference

Base class for the model class hierarchy.

Inheritance diagram for Model:
Public Member Functions

- **Model ()**
  
  *default constructor*

- **Model (ProblemDescDB &problem_db)**
  
  *standard constructor for envelope*

- **Model (const Model &model)**
  
  *copy constructor*

- **virtual ~Model ()**
  
  *destructor*

- **Model operator= (const Model &model)**
  
  *assignment operator*

- **virtual Iterator & subordinate_iterator ()**
  
  *return the sub-iterator in nested and surrogate models*

- **virtual Model & subordinate_model ()**
  
  *return a single sub-model defined from subModel in nested and recast models and truth_model() in surrogate models; used for a directed dive through model recursions that may bypass some components.*

- **virtual void active_model_key (const UShortArray &mi_key)**
  
  *set the active multi-index key within surrogate data, grid driver, and approximation classes that support the management of multiple approximation states within surrogate models*

- **virtual void clear_model_keys ()**
  
  *reset by removing all multi-index keys within surrogate data, grid driver, and approximation classes that support the management of multiple approximation states within surrogate models*

- **virtual size_t qoi () const**
  
  *return number of unique response functions (managing any aggregations)*

- **virtual Model & surrogate_model ()**
  
  *return the active approximation sub-model in surrogate models*

- **virtual void surrogate_model_key (unsigned short lf_model_index, unsigned short lf_soln_lev_index=USHRT_MAX)**
  
  *set the indices that define the active approximation sub-model within surrogate models*
• virtual void surrogate\_model\_key (const UShortArray &lf\_key)
  set the index pair that defines the active approximation sub-model within surrogate models

• virtual const UShortArray & surrogate\_model\_key () const
  return the indices of the active approximation sub-model within surrogate models

• virtual Model & truth\_model ()
  return the active truth sub-model in surrogate models

• virtual const UShortArray & truth\_model\_key () const
  return the indices of the active truth sub-model within surrogate models

• virtual void derived\_subordinate\_models (ModelList &ml, bool recurse\_flag)
  portion of subordinate\_models() specific to derived model classes

• virtual void resize\_from\_subordinate\_model (size\_t depth=std::numeric\_limits\<size\_t\>::max())
  resize vars/resp if needed from the bottom up

• virtual void update\_from\_subordinate\_model (size\_t depth=std::numeric\_limits\<size\_t\>::max())
  propagate vars/labels/bounds/targets from the bottom up

• virtual Interface & derived\_interface ()
  return the interface employed by the derived model class, if present: SimulationModel::userDefinedInterface, DataFitSurrModel::approxInterface, or NestedModel::optionalInterface

• virtual size\_t solution\_levels (bool lwr\_bnd=true) const
  number of discrete levels within solution control (SimulationModel)

• virtual void solution\_level\_index (unsigned short index)
  activate a particular level within the solution level control and return the cost estimate (SimulationModel)

• virtual unsigned short solution\_level\_index () const
  return currently active level within the solution level control (SimulationModel)

• virtual RealVector solution\_level\_costs () const
  return ordered cost estimates across solution levels (SimulationModel)

• virtual Real solution\_level\_cost () const
  return currently active cost estimate from solution level control (SimulationModel)

• virtual void primary\_response\_fn\_weights (const RealVector &wts, bool recurse\_flag=true)
  set the relative weightings for multiple objective functions or least squares terms

• virtual void surrogate\_function\_indices (const IntSet &surr\_fn\_indices)
  set the (currently active) surrogate function index set

• virtual bool initialize\_mapping (ParLevLIter pl\_iter)
  initialize model mapping, returns true if the variables size has changed

• virtual bool finalize\_mapping ()
  finalize model mapping, returns true if the variables size has changed

• virtual bool mapping\_initialized () const
  return true if mapping has been fully initialized, false otherwise.

• virtual bool resize\_pending () const
return true if a potential resize is still pending, such that sizing-based initialization should be deferred

- virtual void build_approximation()
  
  build a new SurrogateModel approximation

- virtual bool build_approximation(const Variables &vars, const IntResponsePair &response_pr)
  
  build a new SurrogateModel approximation using/enforcing anchor response at vars; rebuild if needed

- virtual void rebuild_approximation()
  
  update an existing SurrogateModel approximation

- virtual void update_approximation(bool rebuild_flag)
  
  replace the approximation data within an existing surrogate based on data updates propagated elsewhere

- virtual void update_approximation(const Variables &vars, const IntResponsePair &response, bool rebuild_flag)
  
  replace the anchor point data within an existing surrogate

- virtual void update_approximation(const VariablesArray &vars_array, const IntResponseMap &resp_map, bool rebuild_flag)
  
  replace the data points within an existing surrogate

- virtual void append_approximation(bool rebuild_flag)
  
  append to the existing approximation data within a surrogate based on data updates propagated elsewhere

- virtual void append_approximation(const Variables &vars, const IntResponsePair &response, bool rebuild_flag)
  
  append a single point to an existing surrogate’s data

- virtual void append_approximation(const VariablesArray &vars_array, const IntResponseMap &resp_map, bool rebuild_flag)
  
  append multiple points to an existing surrogate's data

- virtual void append_approximation(const RealMatrix &samples, const IntResponseMap &resp_map, bool rebuild_flag)
  
  append multiple points to an existing surrogate’s data

- virtual void pop_approximation(bool save_surr_data, bool rebuild_flag=false)
  
  remove the previous data set addition to a surrogate (e.g., due to a previous append_approximation() call); flag manages storing of surrogate data for use in a subsequent push_approximation()

- virtual void push_approximation()
  
  push a previous approximation data state; reverse of pop_approximation

- virtual bool push_available()
  
  query for whether a trial increment is restorable within a surrogate

- virtual void finalize_approximation()
  
  finalize an approximation by applying all previous trial increments

- virtual void combine_approximation()
  
  combine the current approximation with previously stored data sets

- virtual void combined_to_active(bool clear_combined=true)
  
  promote the combined approximation into the active approximation

- virtual void clear_inactive()
  
  clear inactive approximations (finalization + combination completed)
virtual void run_dace ()
    execute the DACE iterator (prior to building/appending the approximation)
virtual bool force_rebuild ()
    determine whether a surrogate model rebuild should be forced based on changes in the inactive data
virtual SharedApproxData & shared_approximation ()
    retrieve the shared approximation data within the ApproximationInterface of a DataFitSurrModel
virtual std::vector<Approximation> & approximations ()
    retrieve the set of Approximations within the ApproximationInterface of a DataFitSurrModel
virtual const Pecos::SurrogateData & approximation_data (size_t fn_index, size_t d_index=NPOS)
    retrieve a SurrogateData instance from a particular Approximation instance within the ApproximationInterface of a DataFitSurrModel
virtual const RealVectorArray & approximation_coefficients (bool normalized=false)
    retrieve the approximation coefficients from each Approximation within a DataFitSurrModel
virtual void approximation_coefficients (const RealVectorArray &approx系数s, bool normalized=false)
    set the approximation coefficients for each Approximation within a DataFitSurrModel
virtual const RealVector & approximation_variances (const Variables &vars)
    retrieve the prediction variances from each Approximation within a DataFitSurrModel
virtual void surrogate_response_mode (short mode)
    set response computation mode used in SurrogateModels for forming currentResponse
virtual short surrogate_response_mode () const
    return response computation mode used in SurrogateModels for forming currentResponse
virtual void link_multilevel_approximation_data ()
    link together more than one SurrogateData instance (DataFitSurrModel)
virtual const RealVector & error_estimates ()
    retrieve error estimates corresponding to the Model’s response (could be surrogate error for SurrogateModels, statistical MSE for NestedModels, or adjoint error estimates for SimulationModels). Errors returned correspond to most recent evaluate().
virtual DiscrepancyCorrection & discrepancy_correction ()
    return the DiscrepancyCorrection object used by SurrogateModels
virtual void correction_type (short corr_type)
    set the correction type from the DiscrepancyCorrection object used by SurrogateModels
virtual short correction_type () const
    return the correction type from the DiscrepancyCorrection object used by SurrogateModels
virtual void single_apply (const Variables &vars, Response &resp, const UShortArrayPair &keys)
    apply the DiscrepancyCorrection object to correct an approximation within a SurrogateModel
virtual void recursive_apply (const Variables &vars, Response &resp)
    apply the DiscrepancyCorrection object to recursively correct an approximation within a HierarchSurrModel
virtual void component_parallel_mode (short mode)
    update componentParallelMode for supporting parallelism in model sub-components
virtual IntIntPair estimate_partition_bounds (int max_eval_concurrency)
    estimate the minimum and maximum partition sizes that can be utilized by this Model
virtual size_t mi_parallel_level_index () const
CHAPTER 13. CLASS DOCUMENTATION

virtual void cache_unmatched_response (int raw_id)

migrate an unmatched response record from active response map (computed by synchronize() or synchronize_nowait()) to cached response map

virtual short local_eval_synchronization ()

return derived model synchronization setting

virtual int local_eval_concurrency ()

return derived model asynchronous evaluation concurrency

virtual void serve_run (ParLevLIter pl_iter, int max_eval_concurrency)

Service job requests received from the master. Completes when a termination message is received from stop_servers().

virtual void stop_servers ()

Executed by the master to terminate all server operations for a particular model when iteration on the model is complete.

virtual bool derived_master_overload () const

Return a flag indicating the combination of multiprocessor evaluations and a dedicated master iterator scheduling. Used in synchronous evaluate functions to prevent the error of trying to run a multiprocessor job on the master.

virtual void inactive_view (short view, bool recurse_flag=true)

update the Model’s inactive view based on higher level (nested) context

virtual const String & interface_id () const

return the interface identifier

virtual int derived_evaluation_id () const

Return the value of the evaluation id counter for the Model.

virtual bool evaluation_cache (bool recurse_flag=true) const

Indicates the usage of an evaluation cache by the Model.

virtual bool restart_file (bool recurse_flag=true) const

Indicates the usage of a restart file by the Model.

virtual void set_evaluation_reference ()

Set the reference points for the evaluation counters within the Model.

virtual void fine_grained_evaluation_counters ()

Request fine-grained evaluation reporting within the Model.

virtual void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const

Print an evaluation summary for the Model.

virtual void eval_tag_prefix (const String &eval_id_str)

set the hierarchical eval ID tag prefix

virtual bool db_lookup (const Variables &search_vars, const ActiveSet &search_set, Response &found_resp)

search the eval database (during derivative estimation); derived may need to reimplement due to problem transformations (RecastModel); return true if found in DB

virtual void stop_init_mapping (ParLevLIter pl_iter)

called from IteratorScheduler::run_iterator() for iteratorComm rank 0 to terminate serve_init_mapping() on other iteratorComm processors

virtual int serve_init_mapping (ParLevLIter pl_iter)
• virtual void stop_finalize_mapping (ParLevLIter pl_iter)  
  called from IteratorScheduler::run_iterator() for iteratorComm rank != 0 to terminate serve_finalize_mapping() on other iteratorComm processors

• virtual int serve_finalize_mapping (ParLevLIter pl_iter)  
  called from IteratorScheduler::run_iterator() for iteratorComm rank != 0 to balance resize() calls on iteratorComm rank 0

• virtual void warm_start_flag (const bool flag)  
  set the warm start flag (warmStartFlag)

• virtual void declare_sources ()  
  Declare a model’s sources to the evaluationsDB.

• Modellist & subordinate_models (bool recurse_flag=true)  
  return the sub-models in nested and surrogate models

• void evaluate ()  
  Compute the Response at currentVariables (default ActiveSet).

• void evaluate (const ActiveSet &set)  
  Compute the Response at currentVariables (specified ActiveSet).

• void evaluate_nowait ()  
  Spawn an asynchronous job (or jobs) that computes the value of the Response at currentVariables (default ActiveSet).

• void evaluate_nowait (const ActiveSet &set)  
  Spawn an asynchronous job (or jobs) that computes the value of the Response at currentVariables (specified ActiveSet).

• const IntResponseMap & synchronize ()  
  Execute a blocking scheduling algorithm to collect the complete set of results from a group of asynchronous evaluations.

• const IntResponseMap & synchronize_nowait ()  
  Execute a nonblocking scheduling algorithm to collect all available results from a group of asynchronous evaluations.

• int evaluation_id () const  
  return Model’s (top-level) evaluation counter, not to be confused with derived counter returned by derived_evaluation_id()

• void init_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)  
  allocate communicator partitions for a model and store configuration in modelPCIterMap

• void init_serial ()  
  for cases where init_communicators() will not be called, modify some default settings to behave properly in serial.

• void set_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)  
  set active parallel configuration for the model (set modelPCIter from modelPCIterMap)

• void free_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)  
  deallocate communicator partitions for a model

• MPI_Comm analysis_comm () const  
  retrieve the MPI communicator on which this model is configured to conduct function evaluation analyses (provided for library clients)

• void stop_init_communicators (ParLevLIter pl_iter)
called from IteratorScheduler::init_iterator() for iteratorComm rank 0 to terminate serve_init_communicators() on other iteratorComm processors

• int serve_init_communicators (ParLevIter pl_iter)
called from IteratorScheduler::init_iterator() for iteratorComm rank != 0 to balance init_communicators() calls on iteratorComm rank 0

• void estimate_message_lengths ()
estimate messageLengths for a model

• size_t response_size () const
return (potentially aggregated) size of response vector in currentResponse

• bool manage_data_recastings ()
initialize modelList and recastFlags for data import/export

• bool recastings () const
return true if recastFlags is defined

• void user_space_to_iterator_space (const Variables &user_vars, const Response &user_resp, Variables &iter_vars, Response &iterresp)
employ the model recursion to transform from bottom level user-space data to top level iterator-space data

• void iterator_space_to_user_space (const Variables &iter_vars, const Response &iter_resp, Variables &user_vars, Response &user_resp)
employ the model recursion to transform from top level iterator-space data to bottom level user-space data

• void assign_rep (Model *model_rep, bool ref_count_incr=true)
replaces existing letter with a new one

• size_t tv () const
returns total number of vars

• size_t cv () const
returns number of active continuous variables

• size_t div () const
returns number of active discrete integer vars

• size_t dsv () const
returns number of active discrete string vars

• size_t drv () const
returns number of active discrete real vars

• size_t icv () const
returns number of inactive continuous variables

• size_t idiv () const
returns number of inactive discrete integer vars

• size_t idsv () const
returns number of inactive discrete string vars

• size_t idrv () const
returns number of inactive discrete real vars

• size_t acv () const
returns total number of continuous variables

• size_t adiv () const
returns total number of discrete integer vars

• size_t adsv () const
returns total number of discrete string vars
• size_t adrv () const
  returns total number of discrete real vars
• void active_variables (const Variables &vars)
  set the active variables in currentVariables
• const RealVector & continuous_variables () const
  return the active continuous variables from currentVariables
• Real continuous_variable (size_t i) const
  return an active continuous variable from currentVariables
• void continuous_variables (const RealVector &c_vars)
  set the active continuous variables in currentVariables
• void continuous_variable (Real c_var, size_t i)
  set an active continuous variable in currentVariables
• const IntVector & discrete_int_variables () const
  return the active discrete integer variables from currentVariables
• int discrete_int_variable (size_t i) const
  return an active discrete integer variable from currentVariables
• void discrete_int_variables (const IntVector &d_vars)
  set the active discrete integer variables in currentVariables
• void discrete_int_variable (int d_var, size_t i)
  set an active discrete integer variable in currentVariables
• StringMultiArrayConstView discrete_string_variables () const
  return the active discrete string variables from currentVariables
• const String & discrete_string_variable (size_t i) const
  return an active discrete string variable from currentVariables
• void discrete_string_variables (StringMultiArrayConstView d_vars)
  set the active discrete string variables in currentVariables
• void discrete_string_variable (const String &d_var, size_t i)
  set an active discrete string variable in currentVariables
• const RealVector & discrete_real_variables () const
  return the active discrete real variables from currentVariables
• Real discrete_real_variable (size_t i) const
  return an active discrete real variable from currentVariables
• void discrete_real_variables (const RealVector &d_vars)
  set the active discrete real variables in currentVariables
• void discrete_real_variable (Real d_var, size_t i)
  set an active discrete real variable in currentVariables
• UShortMultiArrayConstView continuous_variable_types () const
  return the active continuous variable types from currentVariables
• void continuous_variable_types (UShortMultiArrayConstView cv_types)
  set the active continuous variable types in currentVariables
• void continuous_variable_type (unsigned short cv_type, size_t i)
  set an active continuous variable type in currentVariables
• UShortMultiArrayConstView discrete_int_variable_types () const
  return the active discrete variable types from currentVariables
• void discrete_int_variable_types (UShortMultiArrayConstView div_types)
  set the active discrete variable types in currentVariables
• void discrete_int_variable_type (unsigned short div_type, size_t i)
  set an active discrete variable type in currentVariables
• UShortMultiArrayConstView discrete_string_variable_types () const
  return the active discrete variable types from currentVariables
• void discrete_string_variable_types (UShortMultiArrayConstView div_types)
  set the active discrete variable types in currentVariables
• void discrete_string_variable_type (unsigned short div_type, size_t i)
  set an active discrete variable type in currentVariables
• UShortMultiArrayConstView discrete_real_variable_types () const
  return the active discrete variable types from currentVariables
• void discrete_real_variable_types (UShortMultiArrayConstView drv_types)
  set the active discrete variable types in currentVariables
• void discrete_real_variable_type (unsigned short drv_type, size_t i)
  set an active discrete variable type in currentVariables
• SizetMultiArrayConstView continuous_variable_ids () const
  return the active continuous variable identifiers from currentVariables
• void continuous_variable_ids (SizetMultiArrayConstView cv_ids)
  set the active continuous variable identifiers in currentVariables
• void continuous_variable_id (size_t cv_id, size_t i)
  set an active continuous variable identifier in currentVariables
• const RealVector & inactive_continuous_variables () const
  return the inactive continuous variables in currentVariables
• void inactive_continuous_variables (const RealVector &i_c_vars)
  set the inactive continuous variables in currentVariables
• const IntVector & inactive_discrete_int_variables () const
  return the inactive discrete variables in currentVariables
• void inactive_discrete_int_variables (const IntVector &i_d_vars)
  set the inactive discrete variables in currentVariables
• StringMultiArrayConstView inactive_discrete_string_variables () const
  return the inactive discrete variables in currentVariables
• void inactive_discrete_string_variables (StringMultiArrayConstView i_d_vars)
  set the inactive discrete variables in currentVariables
• const RealVector & inactive_discrete_real_variables () const
  return the inactive discrete variables in currentVariables
• void inactive_discrete_real_variables (const RealVector &i_d_vars)
  set the inactive discrete variables in currentVariables
• UShortMultiArrayConstView inactive_continuous_variable_types () const
  return the inactive continuous variable types from currentVariables
• SizetMultiArrayConstView inactive_continuous_variable_ids () const
return the inactive continuous variable identifiers from currentVariables

- const RealVector & all_continuous_variables() const
  return all continuous variables in currentVariables

- void all_continuous_variables(const RealVector &a_c_vars)
  set all continuous variables in currentVariables

- void all_continuous_variable(Real a_c_var, size_t i)
  set a variable within the all continuous variables in currentVariables

- const IntVector & all_discrete_int_variables() const
  return all discrete variables in currentVariables

- void all_discrete_int_variables(const IntVector &a_d_vars)
  set all discrete variables in currentVariables

- void all_discrete_int_variable(int a_d_var, size_t i)
  set a variable within the all discrete variables in currentVariables

- StringMultiArrayConstView all_discrete_string_variables() const
  return all discrete variables in currentVariables

- void all_discrete_string_variables(StringMultiArrayConstView a_d_vars)
  set all discrete variables in currentVariables

- void all_discrete_string_variable(const String &a_d_var, size_t i)
  set a variable within the all discrete variables in currentVariables

- const RealVector & all_discrete_real_variables() const
  return all discrete variables in currentVariables

- void all_discrete_real_variables(const RealVector &a_d_vars)
  set all discrete variables in currentVariables

- void all_discrete_real_variable(Real a_d_var, size_t i)
  set a variable within the all discrete variables in currentVariables

- UShortMultiArrayConstView all_continuous_variable_types() const
  return all continuous variable types from currentVariables

- UShortMultiArrayConstView all_discrete_int_variable_types() const
  return all discrete variable types from currentVariables

- UShortMultiArrayConstView all_discrete_string_variable_types() const
  return all discrete variable types from currentVariables

- UShortMultiArrayConstView all_discrete_real_variable_types() const
  return all discrete variable types from currentVariables

- SizetMultiArrayConstView all_continuous_variable_ids() const
  return all continuous variable identifiers from currentVariables

- const IntSetArray & discrete_design_set_int_values() const
  return the sets of values available for each of the discrete design set integer variables

- void discrete_design_set_int_values(const IntSetArray &isa)
  define the sets of values available for each of the discrete design set integer variables

- const StringSetArray & discrete_design_set_string_values() const
  return the sets of values available for each of the discrete design set string variables

- void discrete_design_set_string_values(const StringSetArray &ssa)
  define the sets of values available for each of the discrete design set string variables
• const RealSetArray & \textit{discrete\_design\_set\_real\_values} () const
  \textit{return the sets of values available for each of the discrete design set real variables}
• void \textit{discrete\_design\_set\_real\_values} (const RealSetArray &rsa)
  \textit{define the sets of values available for each of the discrete design set real variables}
• const IntSetArray & \textit{discrete\_state\_set\_int\_values} () const
  \textit{return the sets of values available for each of the discrete state set integer variables}
• void \textit{discrete\_state\_set\_int\_values} (const IntSetArray &isa)
  \textit{define the sets of values available for each of the discrete state set integer variables}
• const StringSetArray & \textit{discrete\_state\_set\_string\_values} () const
  \textit{return the sets of values available for each of the discrete state set string variables}
• void \textit{discrete\_state\_set\_string\_values} (const StringSetArray &ssa)
  \textit{define the sets of values available for each of the discrete state set string variables}
• const RealSetArray & \textit{discrete\_state\_set\_real\_values} () const
  \textit{return the sets of values available for each of the discrete state set real variables}
• void \textit{discrete\_state\_set\_real\_values} (const RealSetArray &rsa)
  \textit{define the sets of values available for each of the discrete state set real variables}
• const BitArray & \textit{discrete\_int\_sets} ()
  \textit{define and return discreteIntSets using active view from currentVariables}
• const BitArray & \textit{discrete\_int\_sets} (short active\_view)
  \textit{define and return discreteIntSets using passed active view}
• const IntSetArray & \textit{discrete\_set\_int\_values} ()
  \textit{return the sets of values available for each of the active discrete set integer variables (aggregated in activeDiscSet\_IntValues)}
• const IntSetArray & \textit{discrete\_set\_int\_values} (short active\_view)
  \textit{return the sets of values available for each of the active discrete set integer variables (aggregated in activeDiscSet\_IntValues)}
• const StringSetArray & \textit{discrete\_set\_string\_values} ()
  \textit{return the sets of values available for each of the active discrete set string variables (aggregated in activeDiscSet\_StringValues)}
• const StringSetArray & \textit{discrete\_set\_string\_values} (short active\_view)
  \textit{return the sets of values available for each of the active discrete set string variables (aggregated in activeDiscSet\_StringValues)}
• const RealSetArray & \textit{discrete\_set\_real\_values} ()
  \textit{return the sets of values available for each of the active discrete set real variables (aggregated in activeDiscSet\_RealValues)}
• const RealSetArray & \textit{discrete\_set\_real\_values} (short active\_view)
  \textit{return the sets of values available for each of the active discrete set real variables (aggregated in activeDiscSet\_RealValues)}
• Pecos::AleatoryDistParams & \textit{aleatory\_distribution\_parameters} ()
  \textit{return aleatDistParams}
• const Pecos::AleatoryDistParams & \textit{aleatory\_distribution\_parameters} () const
  \textit{return aleatDistParams}
• void \textit{aleatory\_distribution\_parameters} (const Pecos::AleatoryDistParams &adp)
  \textit{set aleatDistParams}
- Pecos::EpistemicDistParams & epistemic_distribution_parameters()
  return epistDistParams
- const Pecos::EpistemicDistParams & epistemic_distribution_parameters() const
  return epistDistParams
- void epistemic_distribution_parameters(const Pecos::EpistemicDistParams &edp)
  set epistDistParams
- StringMultiArrayConstView continuous_variable_labels() const
  return the active continuous variable labels from currentVariables
- void continuous_variable_labels(StringMultiArrayConstView c_v_labels)
  set the active continuous variable labels in currentVariables
- StringMultiArrayConstView discrete_int_variable_labels() const
  return the active discrete variable labels from currentVariables
- void discrete_int_variable_labels(StringMultiArrayConstView d_v_labels)
  set the active discrete variable labels in currentVariables
- StringMultiArrayConstView discrete_string_variable_labels() const
  return the active discrete variable labels from currentVariables
- void discrete_string_variable_labels(StringMultiArrayConstView d_v_labels)
  set the active discrete variable labels in currentVariables
- StringMultiArrayConstView discrete_real_variable_labels() const
  return the active discrete variable labels from currentVariables
- void discrete_real_variable_labels(StringMultiArrayConstView d_v_labels)
  set the active discrete variable labels in currentVariables
- StringMultiArrayConstView inactive_continuous_variable_labels() const
  return the inactive continuous variable labels in currentVariables
- void inactive_continuous_variable_labels(StringMultiArrayConstView i_c_v_labels)
  set the inactive continuous variable labels in currentVariables
- StringMultiArrayConstView inactive_discrete_int_variable_labels() const
  return the inactive discrete variable labels in currentVariables
- void inactive_discrete_int_variable_labels(StringMultiArrayConstView i_d_v_labels)
  set the inactive discrete variable labels in currentVariables
- StringMultiArrayConstView inactive_discrete_string_variable_labels() const
  return the inactive discrete variable labels in currentVariables
- void inactive_discrete_string_variable_labels(StringMultiArrayConstView i_d_v_labels)
  set the inactive discrete variable labels in currentVariables
- StringMultiArrayConstView inactive_discrete_real_variable_labels() const
  return the inactive discrete variable labels in currentVariables
- void inactive_discrete_real_variable_labels(StringMultiArrayConstView i_d_v_labels)
  set the inactive discrete variable labels in currentVariables
- StringMultiArrayConstView all_continuous_variable_labels() const
  return all continuous variable labels in currentVariables
- void all_continuous_variable_labels(StringMultiArrayConstView a_c_v_labels)
  set all continuous variable labels in currentVariables
- void all_continuous_variable_label(const String &a_c_v_label, size_t i)
set a label within the all continuous labels in currentVariables

- `StringMultiArrayConstView all_discrete_int_variable_labels () const`  
  return all discrete variable labels in currentVariables

- `void all_discrete_int_variable_labels (StringMultiArrayConstView a_d_v_labels)`  
  set all discrete variable labels in currentVariables

- `void all_discrete_int_variable_label (const String &a_d_v_label, size_t i)`  
  set a label within the all discrete labels in currentVariables

- `StringMultiArrayConstView all_discrete_string_variable_labels () const`  
  return all discrete variable labels in currentVariables

- `void all_discrete_string_variable_labels (StringMultiArrayConstView a_d_v_labels)`  
  set all discrete variable labels in currentVariables

- `void all_discrete_string_variable_label (const String &a_d_v_label, size_t i)`  
  set a label within the all discrete labels in currentVariables

- `const StringArray & response_labels () const`  
  return the response labels from currentResponse

- `void response_labels (const StringArray &resp_labels)`  
  set the response labels in currentResponse

- `const RealVector & continuous_lower_bounds () const`  
  return the active continuous lower bounds from userDefinedConstraints

- `Real continuous_lower_bound (size_t i) const`  
  return an active continuous lower bound from userDefinedConstraints

- `void continuous_lower_bounds (const RealVector &c_l_bnds)`  
  set the active continuous lower bounds in userDefinedConstraints

- `void continuous_lower_bound (Real c_l_bnd, size_t i)`  
  set the i-th active continuous lower bound in userDefinedConstraints

- `const RealVector & continuous_upper_bounds () const`  
  return the active continuous upper bounds from userDefinedConstraints

- `Real continuous_upper_bound (size_t i) const`  
  return an active continuous upper bound from userDefinedConstraints

- `void continuous_upper_bounds (const RealVector &c_u_bnds)`  
  set the active continuous upper bounds in userDefinedConstraints

- `void continuous_upper_bound (Real c_u_bnd, size_t i)`  
  set the i-th active continuous upper bound from userDefinedConstraints

- `const IntVector & discrete_int_lower_bounds () const`  
  return the active discrete int lower bounds from userDefinedConstraints

- `int discrete_int_lower_bound (size_t i) const`  
  return an active discrete int lower bound from userDefinedConstraints
• void discrete_int_lower_bounds (const IntVector &d_l_bnds)
  
  set the active discrete int lower bounds in userDefinedConstraints

• void discrete_int_lower_bound (int d_l_bnd, size_t i)
  
  set the i-th active discrete int lower bound in userDefinedConstraints

const IntVector & discrete_int_upper_bounds () const
  
  return the active discrete int upper bounds from userDefinedConstraints

• int discrete_int_upper_bound (size_t i) const
  
  return an active discrete int upper bound from userDefinedConstraints

• void discrete_int_upper_bounds (const IntVector &d_u_bnds)
  
  set the active discrete int upper bounds in userDefinedConstraints

• void discrete_int_upper_bound (int d_u_bnd, size_t i)
  
  set the i-th active discrete int upper bound in userDefinedConstraints

const RealVector & discrete_real_lower_bounds () const
  
  return the active discrete real lower bounds from userDefinedConstraints

Real discrete_real_lower_bound (size_t i) const
  
  return an active discrete real lower bound from userDefinedConstraints

• void discrete_real_lower_bounds (const RealVector &d_l_bnds)
  
  set the active discrete real lower bounds in userDefinedConstraints

• void discrete_real_lower_bound (Real d_l_bnd, size_t i)
  
  set the i-th active discrete real lower bound in userDefinedConstraints

const RealVector & discrete_real_upper_bounds () const
  
  return the active discrete real upper bounds from userDefinedConstraints

Real discrete_real_upper_bound (size_t i) const
  
  return an active discrete real upper bound from userDefinedConstraints

• void discrete_real_upper_bounds (const RealVector &d_u_bnds)
  
  set the active discrete real upper bounds in userDefinedConstraints

• void discrete_real_upper_bound (Real d_u_bnd, size_t i)
  
  set the i-th active discrete real upper bound in userDefinedConstraints

const RealVector & inactive_continuous_lower_bounds () const
  
  return the inactive continuous lower bounds in userDefinedConstraints

• void inactive_continuous_lower_bounds (const RealVector &i_c_l_bnds)
  
  set the inactive continuous lower bounds in userDefinedConstraints

const RealVector & inactive_continuous_upper_bounds () const
  
  return the inactive continuous upper bounds in userDefinedConstraints

• void inactive_continuous_upper_bounds (const RealVector &i_c_u_bnds)
  
  set the inactive continuous upper bounds in userDefinedConstraints

const IntVector & inactive_discrete_int_lower_bounds () const
  
  return the inactive discrete lower bounds in userDefinedConstraints

• void inactive_discrete_int_lower_bounds (const IntVector &i_d_l_bnds)
  
  set the inactive discrete lower bounds in userDefinedConstraints

const IntVector & inactive_discrete_int_upper_bounds () const
  
  return the inactive discrete upper bounds in userDefinedConstraints

• void inactive_discrete_int_upper_bounds (const IntVector &i_d_u_bnds)
set the inactive discrete upper bounds in userDefinedConstraints

- const RealVector & inactive_discrete_real_upper_bounds () const
  return the inactive discrete upper bounds in userDefinedConstraints
- void inactive_discrete_real_upper_bounds (const RealVector &i_d_u_bnds)
  set the inactive discrete upper bounds in userDefinedConstraints
- const RealVector & inactive_discrete_real_lower_bounds () const
  return the inactive discrete lower bounds in userDefinedConstraints
- void inactive_discrete_real_lower_bounds (const RealVector &i_d_l_bnds)
  set the inactive discrete lower bounds in userDefinedConstraints

set the inactive discrete lower bounds in userDefinedConstraints

- const RealVector & inactive_discrete_int_upper_bounds () const
  return all continuous upper bounds in userDefinedConstraints
- void all_continuous_upper_bounds (const RealVector &a_c_u_bnds)
  set all continuous upper bounds in userDefinedConstraints
- void all_continuous_upper_bound (Real a_c_u_bnd, size_t i)
  set an upper bound within all continuous upper bounds in userDefinedConstraints
- const RealVector & all_continuous_int_upper_bounds () const
  return all continuous upper bounds in userDefinedConstraints
- void all_continuous_int_upper_bounds (const IntVector &a_d_u_bnds)
  set all continuous upper bounds in userDefinedConstraints
- void all_continuous_int_upper_bound (int a_d_u_bnd, size_t i)
  set an upper bound within all discrete upper bounds in userDefinedConstraints

set the inactive discrete lower bounds in userDefinedConstraints

- void all_discrete_int_lower_bounds (const IntVector &a_d_l_bnds)
  set all discrete lower bounds in userDefinedConstraints
- void all_discrete_int_lower_bound (int a_d_l_bnd, size_t i)
  set a lower bound within all discrete lower bounds in userDefinedConstraints
- const IntVector & all_discrete_int_upper_bounds () const
  return all discrete upper bounds in userDefinedConstraints
- void all_discrete_int_upper_bounds (const IntVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints
- void all_discrete_int_upper_bound (int a_d_u_bnd, size_t i)
  set an upper bound within all discrete upper bounds in userDefinedConstraints

set the inactive discrete upper bounds in userDefinedConstraints

- void all_discrete_real_upper_bounds (const RealVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints
- void all_discrete_real_upper_bound (Real a_d_u_bnd, size_t i)
  set a lower bound within all discrete lower bounds in userDefinedConstraints
- const RealVector & all_discrete_real_upper_bounds () const
  return all discrete upper bounds in userDefinedConstraints
- void all_discrete_real_upper_bounds (const RealVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints

set the inactive discrete lower bounds in userDefinedConstraints

- void all_discrete_real_lower_bounds (const RealVector &a_d_l_bnds)
  set all discrete lower bounds in userDefinedConstraints
- void all_discrete_real_lower_bound (Real a_d_l_bnd, size_t i)
  set a lower bound within all discrete lower bounds in userDefinedConstraints
- const RealVector & all_discrete_real_lower_bounds () const
  return all discrete lower bounds in userDefinedConstraints
- void all_discrete_real_lower_bounds (const RealVector &a_d_l_bnds)
  set all discrete lower bounds in userDefinedConstraints

set the inactive discrete upper bounds in userDefinedConstraints

- void all_discrete_int_lower_bounds (const IntVector &a_d_l_bnds)
  set all discrete lower bounds in userDefinedConstraints
- void all_discrete_int_lower_bound (int a_d_l_bnd, size_t i)
  set a lower bound within all discrete lower bounds in userDefinedConstraints
- const IntVector & all_discrete_int_upper_bounds () const
  return all discrete upper bounds in userDefinedConstraints
- void all_discrete_int_upper_bounds (const IntVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints
- void all_discrete_int_upper_bound (int a_d_u_bnd, size_t i)
  set an upper bound within all discrete upper bounds in userDefinedConstraints

set the inactive discrete lower bounds in userDefinedConstraints

- void all_discrete_real_upper_bounds (const RealVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints
- void all_discrete_real_upper_bound (Real a_d_u_bnd, size_t i)
  set a lower bound within all discrete lower bounds in userDefinedConstraints
- const RealVector & all_discrete_real_upper_bounds () const
  return all discrete upper bounds in userDefinedConstraints
- void all_discrete_real_upper_bounds (const RealVector &a_d_u_bnds)
  set all discrete upper bounds in userDefinedConstraints
• void all_discrete_real_upper_bound (Real a_d_u_bnd, size_t i)
  set an upper bound within all discrete upper bounds in userDefinedConstraints
• void reshape_constraints (size_t num_nln_ineq_cons, size_t num_nln_eq_cons, size_t num_lin_ineq_cons, size_t num_lin_eq_cons)
  reshape the linear/nonlinear constraint arrays
• size_t num_linear_ineq_constraints () const
  return the number of linear inequality constraints
• size_t num_linear_eq_constraints () const
  return the number of linear equality constraints
• const RealMatrix & linear_ineq_constraint_coeffs () const
  return the linear inequality constraint coefficients
• void linear_ineq_constraint_coeffs (const RealMatrix &lin_ineq_coeffs)
  set the linear inequality constraint coefficients
• const RealVector & linear_ineq_constraint_lower_bounds () const
  return the linear inequality constraint lower bounds
• void linear_ineq_constraint_lower_bounds (const RealVector &lin_ineq_l_bnds)
  set the linear inequality constraint lower bounds
• const RealVector & linear_ineq_constraint_upper_bounds () const
  return the linear inequality constraint upper bounds
• void linear_ineq_constraint_upper_bounds (const RealVector &lin_ineq_u_bnds)
  set the linear inequality constraint upper bounds
• const RealMatrix & linear_eq_constraint_coeffs () const
  return the linear equality constraint coefficients
• void linear_eq_constraint_coeffs (const RealMatrix &lin_eq_coeffs)
  set the linear equality constraint coefficients
• const RealVector & linear_eq_constraint_targets () const
  return the linear equality constraint targets
• void linear_eq_constraint_targets (const RealVector &lin_eq_targets)
  set the linear equality constraint targets
• size_t num_nonlinear_ineq_constraints () const
  return the number of nonlinear inequality constraints
• size_t num_nonlinear_eq_constraints () const
  return the number of nonlinear equality constraints
• const RealVector & nonlinear_ineq_constraint_lower_bounds () const
  return the nonlinear inequality constraint lower bounds
• void nonlinear_ineq_constraint_lower_bounds (const RealVector &nln_ineq_l_bnds)
  set the nonlinear inequality constraint lower bounds
• const RealVector & nonlinear_ineq_constraint_upper_bounds () const
  return the nonlinear inequality constraint upper bounds
• void nonlinear_ineq_constraint_upper_bounds (const RealVector &nln_ineq_u_bnds)
  set the nonlinear inequality constraint upper bounds
• const RealVector & nonlinear_eq_constraint_targets () const
  return the nonlinear equality constraint targets
- **void nonlinear_eq_constraint_targets** (const RealVector &nln_eq_targets)
  
  set the nonlinear equality constraint targets

- **const Variables & current_variables** () const
  
  return the current variables (currentVariables) as const reference (preferred)

- **Variables & current_variables** ()
  
  return the current variables (currentVariables) in mutable form (special cases)

- **const Constraints & user_defined_constraints** () const
  
  return the user-defined constraints (userDefinedConstraints)

- **const Response & current_response** () const
  
  return the current response (currentResponse)

- **ProblemDescDB & problem_description_db** () const
  
  return the problem description database (probDescDB)

- **ParallelLibrary & parallel_library** () const
  
  return the parallel library (parallelLib)

- **const String & model_type** () const
  
  return the model type (modelType)

- **const String & surrogate_type** () const
  
  return the surrogate type (surrogateType)

- **const String & model_id** () const
  
  return the model identifier (modelId)

- **size_t num_primary_fns** () const
  
  return number of primary functions (total less nonlinear constraints)

- **size_t num_secondary_fns** () const
  
  return number of secondary functions (number of nonlinear constraints)

- **const String & gradient_type** () const
  
  return the gradient evaluation type (gradientType)

- **const String & method_source** () const
  
  return the numerical gradient evaluation method source (methodSource)

- **const String & interval_type** () const
  
  return the numerical gradient evaluation interval type (intervalType)

- **bool ignore_bounds** () const
  
  option for ignoring bounds when numerically estimating derivatives

- **bool central_hess** () const
  
  option for using old 2nd-order scheme when computing finite-diff Hessian

- **const RealVector & fd_gradient_step_size** () const
  
  return the finite difference gradient step size (fdGradStepSize)

- **const String & fd_gradient_step_type** () const
  
  return the finite difference gradient step type (fdGradStepType)

- **const IntSet & gradient_id_analytic** () const
  
  return the mixed gradient analytic IDs (gradIdAnalytic)

- **const IntSet & gradient_id_numerical** () const
  
  return the mixed gradient numerical IDs (gradIdNumerical)

- **const String & hessian_type** () const
return the Hessian evaluation type (hessianType)

- const String & quasi_hessian_type () const
  return the Hessian evaluation type (quasiHessType)

- const RealVector & fd_hessian_by_grad_step_size () const
  return gradient-based finite difference Hessian step size (fdHessByGradStepSize)

- const RealVector & fd_hessian_by_fn_step_size () const
  return function-based finite difference Hessian step size (fdHessByFnStepSize)

- const String & fd_hessian_step_type () const
  return the finite difference Hessian step type (fdHessStepType)

- const IntSet & hessian_id_analytic () const
  return the mixed Hessian analytic IDs (hessIdAnalytic)

- const IntSet & hessian_id_numerical () const
  return the mixed Hessian analytic IDs (hessIdNumerical)

- const IntSet & hessian_id_quasi () const
  return the mixed Hessian analytic IDs (hessIdQuasi)

- void primary_response_fn_sense (const BoolDeque &sense)
  set the optimization sense for multiple objective functions

- const BoolDeque & primary_response_fn_sense () const
  get the optimization sense for multiple objective functions

- const RealVector & primary_response_fn_weights () const
  get the relative weightings for multiple objective functions or least squares terms

- const ScalingOptions & scaling_options () const
  user-provided scaling options

- short primary_fn_type () const
  get the primary response function type (generic, objective, calibration)

- void primary_fn_type (short type)
  set the primary response function type, e.g., when recasting

- bool derivative_estimation ()
  indicates potential usage of estimate_derivatives() based on gradientType/hessianType

- void supports_derivative_estimation (bool sed_flag)
  set whether this model should perform or pass on derivative estimation

- void init_comms_bcast_flag (bool icb_flag)
  set initCommsBcastFlag

- int evaluation_capacity () const
  return the evaluation capacity for use in iterator logic

- int derivative_concurrency () const
  return the gradient concurrency for use in parallel configuration logic

- bool asynch_flag () const
  return the asynchronous evaluation flag (asynchEvalFlag)

- void asynch_flag (const bool flag)
  set the asynchronous evaluation flag (asynchEvalFlag)

- short output_level () const
  return the outputLevel
CHAPTER 13. CLASS DOCUMENTATION

- **void output_level** (const short level)
  set the outputLevel
- **const IntArray & message_lengths** () const
  return the array of MPI packed message buffer lengths (messageLengths)
- **void parallel_configuration_iterator** (ParConfigLIter pc_iter)
  set modelPCIter
- **ParConfigLIter parallel_configuration_iterator** () const
  return modelPCIter
- **void auto_graphics** (const bool flag)
  set modelAutoGraphicsFlag to activate posting of graphics data within evaluate/synchronize functions (automatic graphics posting in the model as opposed to graphics posting at the strategy level).
- **bool auto_graphics** () const
  get modelAutoGraphicsFlag to activate posting of graphics data within evaluate/synchronize functions (automatic graphics posting in the model as opposed to graphics posting at the strategy level).
- **bool is_null** () const
  function to check modelRep (does this envelope contain a letter)
- **Model * model_rep** () const
  returns modelRep for access to derived class member functions that are not mapped to the top Model level
- **virtual String root_model_id** ()
  Return the model ID of the "innermost" model. For all derived Models except RecastModels, return modelId. The RecastModel override returns the root_model_id() of the subModel.
- **virtual ActiveSet default_active_set** ()

**Static Public Member Functions**

- **static void active_variables** (const RealVector &config_vars, Model &model)
  set the specified configuration to the Model's inactive vars, converting from real to integer or through index to string value as needed
- **static void inactive_variables** (const RealVector &config_vars, Model &model)
  set the specified configuration to the Model's inactive vars, converting from real to integer or through index to string value as needed
- **static void inactive_variables** (const RealVector &config_vars, Model &model, Variables &updated_vars)
- **static void evaluate** (const RealMatrix &samples_matrix, Model &model, RealMatrix &resp_matrix)
  Bulk synchronously evaluate the model for each column in the samples matrix and return as columns of the response matrix.

**Protected Member Functions**

- **Model (BaseConstructor, ProblemDescDB &problem_db)**
  constructor initializing the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
- **Model (LightWtBaseConstructor, ProblemDescDB &problem_db, ParallelLibrary &parallel_lib, const Shared-VariablesData &svd, const SharedResponseData &srd, const ActiveSet &set, short output_level)**
  constructor initializing base class for derived model class instances constructed on the fly
- **Model (LightWtBaseConstructor, ProblemDescDB &problem_db, ParallelLibrary &parallel_lib)**
  constructor initializing base class for recast model instances
• virtual void derived_evaluate (const ActiveSet &set)
  portion of evaluate() specific to derived model classes
• virtual void derived_evaluate_nowait (const ActiveSet &set)
  portion of evaluate_nowait() specific to derived model classes
• virtual const IntResponseMap & derived_synchronize ()
  portion of synchronize() specific to derived model classes
• virtual const IntResponseMap & derived_synchronize_nowait ()
  portion of synchronize_nowait() specific to derived model classes
• virtual void derived_init_communicators (ParLevIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  portion of init_communicators() specific to derived model classes
• virtual void derived_init_serial ()
  portion of init_serial() specific to derived model classes
• virtual void derived_set_communicators (ParLevIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  portion of set_communicators() specific to derived model classes
• virtual void derived_free_communicators (ParLevIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  portion of free_communicators() specific to derived model classes
• void set_ie_asynchronous_mode (int max_eval_concurrency)
  default logic for defining asynchEvalFlag and evaluationCapacity based on ie_pl settings
• void string_variable_max (const StringSetArray &ssa, size_t offset, Variables &vars)
  set the current value of each string variable offset + i to the longest string value found in the admissible string set ssa[i]
• void string_variable_max (const StringRealMapArray &srma, size_t offset, Variables &vars)
  set the current value of each string variable offset + i to the longest string value found in the admissible string map srma[i]
• SizetMultiArrayConstView initialize_x0_bounds (const SizetArray &original_dvv, bool &active_derivs, bool &inactive_derivs, RealVector &x0, RealVector &fd_lb, RealVector &fd_ub) const
  Initialize data needed for computing finite differences (active/inactive, center point, and bounds)
• Real forward_grad_step (size_t num_deriv_vars, size_t xj_index, Real x0_j, Real lb_j, Real ub_j)
  Compute the forward step for a finite difference gradient; updates shortStep.
• EvaluationsDBState evaluations_db_state (const Interface &interface)
  Return the interface flag for the EvaluationsDB state.
• EvaluationsDBState evaluations_db_state (const Model &model)
  Return the model flag for the EvaluationsDB state.
• void asynch_eval_store (const Interface &interface, const int &id, const Response &response)
  Store the response portion of an interface evaluation. Called from rekey_response_map.
• void asynch_eval_store (const Model &model, const int &id, const Response &response)
  Exists to support storage of interface evaluations. No-op so that rekey_response_map< Model > can be generated.
• template<typename Metatype >
  void rekey_response_map (Metatype &meta_object, const IntResponseMap &resp_map, IntIntMap &id_map, IntResponseMap &resp_map_rekey, bool deep_copy_resp=false)
  rekey returned jobs matched in id_map into resp_map_rekey; unmatched jobs are cached within the meta_object
• template<typename Metatype >
  void rekey_synch (Metatype &meta_object, bool block, IntIntMap &id_map, IntResponseMap &resp_map_rekey, bool deep_copy_resp=false)
synchronize via meta_object and rekey returned jobs matched in id_map into resp_map_rekey; unmatched jobs are cached within the meta_object

Static Protected Member Functions

- static String user_auto_id ()
  return the next available model ID for no-ID user methods
- static String no_spec_id ()
  return the next available model ID for on-the-fly methods

Protected Attributes

- EvaluationsDBState modelEvaluationsDBState
  Whether to write model evals to the evaluations DB.
- EvaluationsDBState interEvaluationsDBState
  Whether to write interface evals to the evaluations DB.
- Variables currentVariables
  the set of current variables used by the model for performing function evaluations
- size_t numDerivVars
  the number of active continuous variables used in computing most response derivatives (i.e., in places such as quasi-Hessians and response corrections where only the active continuous variables are supported)
- Response currentResponse
  the set of current responses that holds the results of model function evaluations
- size_t numFns
  the number of functions in currentResponse
- Constraints userDefinedConstraints
  Explicit constraints on variables are maintained in the Constraints class hierarchy. Currently, this includes linear constraints and bounds, but could be extended in the future to include other explicit constraints which (1) have their form specified by the user, and (2) are not catalogued in Response since their form and coefficients are published to an iterator at startup.
- String modelId
  model identifier string from the input file
- String modelType
  type of model: simulation, nested, or surrogate
- String surrogateType
  type of surrogate model: local\_*, multipoint\_*, global\_*, or hierarchical
- String gradientType
  type of gradient data: analytic, numerical, mixed, or none
- String methodSource
  source of numerical gradient routine: dakota or vendor
- String intervalType
  type of numerical gradient interval: central or forward
- String hessianType
  type of Hessian data: analytic, numerical, quasi, mixed, or none
- RealVector fdGradStepSize
MODEL CLASS REFERENCE

- **String fdGradStepType**
  
  type of finite difference step to use for numerical gradient: relative - step length is relative to x absolute - step length is what is specified bounds - step length is relative to range of x

- **RealVector fdHessByGradStepSize**
  
  relative finite difference step size for numerical Hessians estimated using first-order differences of gradients

- **RealVector fdHessByFnStepSize**
  
  relative finite difference step size for numerical Hessians estimated using second-order differences of function values

- **String fdHessStepType**
  
  type of finite difference step to use for numerical Hessian: relative - step length is relative to x absolute - step length is what is specified bounds - step length is relative to range of x

- **bool ignoreBounds**
  
  option to ignore bounds when computing finite diffs

- **bool centralHess**
  
  option to use old 2nd-order finite diffs for Hessians

- **bool warmStartFlag**
  
  if in warm-start mode, don’t reset accumulated data (e.g., quasiHessians)

- **bool supportsEstimDerivs**
  
  whether model should perform or forward derivative estimation

- **String quasiHessType**
  
  quasi-Hessian type: bfgs, damped_bfgs, sr1

- **IntSet gradIdAnalytic**
  
  analytic id’s for mixed gradients

- **IntSet gradIdNumerical**
  
  numerical id’s for mixed gradients

- **IntSet hessIdAnalytic**
  
  analytic id’s for mixed Hessians

- **IntSet hessIdNumerical**
  
  numerical id’s for mixed Hessians

- **IntSet hessIdQuasi**
  
  quasi id’s for mixed Hessians

- **IntArray messageLengths**
  
  length of packed MPI buffers containing vars, vars/set, response, and PRPair

- **ProblemDescDB & probDescDB**
  
  class member reference to the problem description database

- **ParallelLibrary & parallelLib**
  
  class member reference to the parallel library

- **ParConfigLIter modelPCIter**
  
  the ParallelConfiguration node used by this Model instance

- **short componentParallelMode**
  
  the component parallelism mode: 0 (none), 1 (INTERFACE/OPTIONAL_INTERFACE/SURROGATE_MODEL), or 2 (SUB_MODEL/TRUTH_MODEL)

- **bool asynchEvalFlag**
  
  flags asynch evaluations (local or distributed)
• int evaluationCapacity
  
  capacity for concurrent evaluations supported by the Model

• short outputLevel
  
  output verbosity level: {SILENT,QUIET,NORMAL,VERBOSE,DEBUG}, OUTPUT

• IntSetArray discreteDesignSetIntValues
  
  array of IntSet's, each containing the set of allowable integer values corresponding to a discrete design integer set variable

• StringSetArray discreteDesignSetStringValues
  
  array of IntSet's, each containing the set of allowable integer values corresponding to a discrete design string set variable

• RealSetArray discreteDesignSetRealValues
  
  array of RealSet's, each containing the set of allowable real values corresponding to a discrete design real set variable

• IntSetArray discreteStateSetIntValues
  
  array of IntSet's, each containing the set of allowable integer values corresponding to a discrete state integer set variable

• StringSetArray discreteStateSetStringValues
  
  array of IntSet's, each containing the set of allowable integer values corresponding to a discrete state string set variable

• RealSetArray discreteStateSetRealValues
  
  array of RealSet's, each containing the set of allowable real values corresponding to a discrete state real set variable

• Pecos::AleatoryDistParams aleatDistParams
  
  container for aleatory random variable distribution parameters

• Pecos::EpistemicDistParams epistDistParams
  
  container for epistemic random variable distribution parameters

• BoolDeque primaryRespFnSense
  
  array of flags (one per primary function) for switching the sense to maximize the primary function (default is minimize)

• RealVector primaryRespFnWts
  
  primary response function weightings (either weights for multiobjective optimization or weighted least squares)

• bool hierarchicalTagging
  
  whether to perform hierarchical evalID tagging of params/results

• ScalingOptions scalingOpts
  
  user-provided scaling data from the problem DB, possibly modified by Recasting

• String evalTagPrefix
  
  cached evalTag Prefix from parents to use at evaluate time

• EvaluationStore & evaluationsDB
  
  reference to the global evaluation database
Private Member Functions

- **Model * get_model (ProblemDescDB &problem_db)**
  
  Used by the envelope to instantiate the correct letter class.

- **int estimate_derivatives (const ShortArray &map_asv, const ShortArray &fd_grad_asv, const ShortArray &fd_hess_asv, const ShortArray &quasi_hess_asv, const ActiveSet &original_set, const bool asynch_flag)**
  
  evaluate numerical gradients using finite differences. This routine is selected with "method_source dakota" (the default method_source) in the numerical gradient specification.

- **void synchronize_derivatives (const Variables &vars, const IntResponseMap &fd_responses, Response &new_response, const ShortArray &fd_grad_asv, const ShortArray &fd_hess_asv, const ShortArray &quasi_hess_asv, const ActiveSet &original_set)**
  
  combine results from an array of finite difference response objects (fd_grad_responses) into a single response (new_response)

- **void update_response (const Variables &vars, Response &new_response, const ShortArray &fd_grad_asv, const ShortArray &fd_hess_asv, const ShortArray &quasi_hess_asv, const ActiveSet &original_set, Response &initial_map_response, const RealMatrix &new_fn_grads, const RealSymMatrixArray &new_fn_hessians)**
  
  overlay results to update a response object

- **void update_quasi_hessians (const Variables &vars, Response &new_response, const ActiveSet &original_set)**
  
  perform quasi-Newton Hessian updates

- **Real finite_difference_lower_bound (UShortMultiArrayConstView cv_types, const RealVector &global_clbnds, size_t cv_index) const**
  
  return the lower bound for a finite difference offset, drawn from global or distribution bounds

- **Real finite_difference_upper_bound (UShortMultiArrayConstView cv_types, const RealVector &global_cubnds, size_t cv_index) const**
  
  return the upper bound for a finite difference offset, drawn from global or distribution bounds

- **bool manage_asv (const ActiveSet &original_set, ShortArray &map_asv_out, ShortArray &fd_grad_asv_out, ShortArray &fd_hess_asv_out, ShortArray &quasi_hess_asv_out)**
  
  Coordinates usage of estimate_derivatives() calls based on asv_in.

- **Real initialize_h (Real x_j, Real lb_j, Real ub_j, Real step_size, String step_type) const**
  
  function to determine initial finite difference h (before step length adjustment) based on type of step desired

- **Real FDstep1 (Real x0_j, Real lb_j, Real ub_j, Real h_mag)**
  
  function returning finite-difference step size (affected by bounds)

- **Real FDstep2 (Real x0_j, Real lb_j, Real ub_j, Real h)**
  
  function returning second central-difference step size (affected by bounds)

Private Attributes

- **int modelEvalCntr**
  
  evaluation counter for top-level evaluate() and evaluate_nowait() calls. Differs from lower level counters in case of numerical derivative estimation (several lower level evaluations are assimilated into a single higher level evaluation)

- **bool estDerivsFlag**
  
  flags presence of estimated derivatives within a set of calls to evaluate_nowait()
flags finite-difference step size adjusted by bounds

- std::map<SizetIntPair, ParConfigIter> modelPCIterMap
  map<> used for tracking modelPCIter instances using depth of parallelism level and max evaluation concurrency as the lookup keys
- bool initCommsBcastFlag
  flag for determining need to bcast the max concurrency from init_communicators(); set from IteratorScheduler::init_iterator()
- bool modelAutoGraphicsFlag
  flag for posting of graphics data within evaluate() (automatic graphics posting in the model as opposed to graphics posting at the strategy level)
- IntVariablesMap varsMap
  history of vars populated in evaluate_nowait() and used in synchronize().
- std::list< ShortArray > asvList
  if estimate_derivatives() is used, transfers ASVs from evaluate_nowait() to synchronize()
- std::list< ActiveSet > setList
  if estimate_derivatives() is used, transfers ActiveSets from evaluate_nowait() to synchronize()
- BoolList initialMapList
  transfers initial_map flag values from estimate_derivatives() to synchronize_derivatives()
- BoolList dbCaptureList
  transfers db_capture flag values from estimate_derivatives() to synchronize_derivatives()
- ResponseList dbResponseList
  transfers database captures from estimate_derivatives() to synchronize_derivatives()
- RealList deltaList
  transfers deltas from estimate_derivatives() to synchronize_derivatives()
- IntIntMap numFDEvalsMap
  tracks the number of evaluations used within estimate_derivatives(). Used in synchronize() as a key for combining finite difference responses into numerical gradients.
- IntIntMap rawEvalIdMap
  maps from the raw evaluation ids returned by derived_synchronize() and derived_synchronize_nowait() to the corresponding modelEvalCntnr id. Used for rekeying responseMap.
- RealVectorArray xPrev
  previous parameter vectors used in computing s for quasi-Newton updates
- RealMatrix fnGradsPrev
  previous gradient vectors used in computing y for quasi-Newton updates
- RealSymMatrixArray quasiHessians
  quasi-Newton Hessian approximations
- SizetArray numQuasiUpdates
  number of quasi-Newton Hessian updates applied
- IntResponseMap responseMap
  used to return a map of responses for asynchronous evaluations in final concatenated form. The similar map in Interface contains raw responses.
- IntResponseMap cachedResponseMap
  caching of responses returned by derived_synchronize(){_nowait()} but not matched within current rawEvalIdMap
• **IntResponseMap** `graphicsRespMap`  
  used to cache the data returned from `derived_synchronize_nowait()` prior to sequential input into the graphics

• **IntSetArray** `activeDiscSetIntValues`  
  aggregation of the admissible value sets for all active discrete set integer variables

• **StringSetArray** `activeDiscSetStringValues`  
  aggregation of the admissible value sets for all active discrete set string variables

• **RealSetArray** `activeDiscSetRealValues`  
  aggregation of the admissible value sets for all active discrete set real variables

• **BitArray** `discreteIntSets`  
  key for identifying discrete integer set variables within the active discrete integer variables

• **ModelList** `modelList`  
  used to collect sub-models for `subordinate_models()`

• **BoolDeque** `recastFlags`  
  a key indicating which models within a model recursion involve recasting

• **Model** `*modelRep`  
  pointer to the letter (initialized only for the envelope)

• **int** `referenceCount`  
  number of objects sharing `modelRep`

### Static Private Attributes

• static `size_t noSpecIdNum = 0`  
  the last used model ID number for on-the-fly instantiations (increment before each use)

### Friends

• bool `operator== (const Model &m1, const Model &m2)`  
  equality operator (detect same letter instance)

• bool `operator!= (const Model &m1, const Model &m2)`  
  inequality operator (detect different letter instances)

### 13.97.1 Detailed Description

Base class for the model class hierarchy.

The **Model** class is the base class for one of the primary class hierarchies in DAKOTA. The model hierarchy contains a set of variables, an interface, and a set of responses, and an iterator operates on the model to map the variables into responses using the interface. For memory efficiency and enhanced polymorphism, the model hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (**Model**) serves as the envelope and one of the derived classes (selected in `Model::get_model()`) serves as the letter.
13.97.2 Constructor & Destructor Documentation

Model ( )

default constructor

The default constructor is used in vector<Model> instantiations and for initialization of Model objects contained in Iterator and derived Strategy classes. modelRep is NULL in this case (a populated problem_db is needed to build a meaningful Model object). This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

Model ( ProblemDescDB & problem_db )

standard constructor for envelope

Used in model instantiations within strategy constructors. Envelope constructor only needs to extract enough data to properly execute get_model, since Model(BaseConstructor, problem_db) builds the actual base class data for the derived models.

References Dakota::abort_handler(), Model::get_model(), and Model::modelRep.

Model ( const Model & model )

copy constructor

Copy constructor manages sharing of modelRep and incrementing of referenceCount.

References Model::modelRep, and Model::referenceCount.

~Model ( ) [virtual]

destructor

Destructor decrements referenceCount and only deletes modelRep when referenceCount reaches zero.

References Model::modelRep, and Model::referenceCount.

Model ( BaseConstructor, ProblemDescDB & problem_db ) [protected]

constructor initializing the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

This constructor builds the base class data for all inherited models. get_model() instantiates a derived class and the derived class selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_model() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~Model).

References Dakota::abort_handler(), Model::fdGradStepSize, Model::fdHessByFnStepSize, Model::fdHessByGradStepSize, ProblemDescDB::get_sa(), Model::gradIdNumerical, Model::gradientType, Model::hessianType, Model::hessIdNumerical, Model::modelId, Model::num_primary_fns(), Model::primaryRespFnSense, Dakota::strbegins(), Dakota::strtolower(), and Model::user_auto_id().

Model ( LightWtBaseConstructor, ProblemDescDB & problem_db, ParallelLibrary & parallel_lib ) [protected]

constructor initializing base class for recast model instances

This constructor also builds the base class data for inherited models. However, it is used for recast models which are instantiated on the fly. Therefore it only initializes a small subset of attributes.
13.97. Member Function Documentation

Model operator=( const Model & model )

assignment operator

Assignment operator decrements referenceCount for old modelRep, assigns new modelRep, and increments
referenceCount for new modelRep.

References Model::modelRep, and Model::referenceCount.

Iterator & subordinate_iterator( ) [virtual]

return the sub-iterator in nested and surrogate models

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this
operation must be performed on the original envelope object.

Reimplemented in RecastModel, DataFitSurrModel, and NestedModel.

References Dakota::dummy_iterator, Model::modelRep, and Model::subordinate_iterator().

model(), and NonDPolynomialChaos::update_model_from_samples().

Model & subordinate_model( ) [virtual]

return a single sub-model defined from subModel in nested and recast models and truth_model() in surrogate
models; used for a directed dive through model recursions that may bypass some components.

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this
operation must be performed on the original envelope object.

Reimplemented in RecastModel, NestedModel, and SurrogateModel.

References Dakota::dummy_model, Model::modelRep, and Model::subordinate_model().

Referenced by NonDGlobalReliability::expected_feasibility(), NonDGlobalReliability::expected_improvement(),
SurrogateModel::force_rebuild(), AdaptedBasisModel::get_sub_model(), NonDExpansion::initialize_expansion(),
Minimizer::initialize_run(), NonDExpansion::initialize_u_space_model(), NonDGlobalReliability::optimize_gaussian-
process(), Minimizer::original_model(), Optimizer::primary_resp_reducer(), Model::subordinate_model(), and Data-
FitSurrModel::update_global_reference().

Model & surrogate_model( ) [virtual]

return the active approximation sub-model in surrogate models

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this
operation must be performed on the original envelope object.
Reimplemented in RecastModel, DataFitSurrModel, and HierarchSurrModel.
References Dakota::dummy_model, Model::modelRep, and Model::surrogate_model().

Referenced by NonDAdaptiveSampling::calc_score_delta_y(), NonDAdaptiveSampling::calc_score_topo_alm_hybrid(), NonDAdaptiveSampling::calc_score_topo_avg_persistence(), NonDAdaptiveSampling::calc_score_topo_bottleneck(), NonDBayesCalibration::construct_mcmc_model(), NonDMultilevelSampling::control_variate_mc(), SurrBasedGlobalMinimizer::core_run(), SurrBasedLocalMinimizer::find_approx_response(), NonDMultilevelSampling::lf_increment(), NonDMultilevelSampling::multilevel_control_variate_mc_Qcorr(), NonDMultilevelSampling::multilevel_control_variate_mc_Ycorr(), NonDMultilevelSampling::output_round_data(), Model::surrogate_model(), and RecastModel::surrogate_model().

Model & truth_model() [virtual]

return the active truth sub-model in surrogate models

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in RecastModel, DataFitSurrModel, and HierarchSurrModel.

References Dakota::dummy_model, Model::modelRep, and Model::truth_model()

Referenced by NonDMultilevelSampling::compute_error_estimates(), NonDMultilevelSampling::control_variate_mc(), SurrBasedGlobalMinimizer::core_run(), SurrBasedLocalMinimizer::find_truth_response(), SurrogateModel::force_rebuild(), SurrBasedMinimizer::initialize_graphics(), NonDMultilevelSampling::multilevel_control_variate_mc_Qcorr(), NonDMultilevelSampling::multilevel_control_variate_mc_Ycorr(), NonDMultilevelSampling::multilevel_mc_Qsum(), NonDMultilevelSampling::multilevel_mc_Ysum(), NonDBayesCalibration::NonDBayesCalibration(), NonDLocalReliability::NonDLocalReliability(), SurrBasedMinimizer::print_results(), NonDMultilevelSampling::print_results(), NonDMultilevelSampling::shared_increment(), SurrogateModel::subordinate_model(), SurrBasedGlobalMinimizer::SurrBasedGlobalMinimizer(), SurrBasedLocalMinimizer::SurrBasedLocalMinimizer(), Model::truth_model(), and RecastModel::truth_model().

void update_from_subordinate_model( size_t depth = std::numeric_limits<size_t>::max() ) [virtual]

propagate vars/labels/bounds/targets from the bottom up

used only for instantiate-on-the-fly model recursions (all RecastModel instantiations and alternate DataFitSurrModel instantiations). Simulation, Hierarchical, and Nested Models do not redefine the function since they do not support instantiate-on-the-fly. This means that the recursion will stop as soon as it encounters a Model that was instantiated normally, which is appropriate since ProblemDescDB-constructed Models use top-down information flow and do not require bottom-up updating.

Reimplemented in RecastModel, DataFitSurrModel, and HierarchSurrModel.

References Model::modelRep, and Model::update_from_subordinate_model().

Referenced by NonDGlobalInterval::core_run(), NonDLocalInterval::core_run(), NonDLocalReliability::initialize_class_data(), NonDExpansion::initialize_expansion(), LeastSq::initialize_run(), Optimizer::initialize_run(), EffGlobalMinimizer::minimize_surrogates_on_model(), NonDMultilevelPolynomialChaos::multilevel_regression(), NonDGlobalReliability::optimize_gaussian_process(), HierarchSurrModel::update_from_subordinate_model(), DataFitSurrModel::update_from_subordinate_model(), Model::update_from_subordinate_model(), and RecastModel::update_from_subordinate_model().

Interface & derived_interface() [virtual]

return the interface employed by the derived model class, if present: SimulationModel::userDefinedInterface, DataFitSurrModel::approxInterface, or NestedModel::optionalInterface
return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in RecastModel, DataFitSurrModel, NestedModel, and SimulationModel.

References Model::derived_interface(), Dakota::dummy_interface, and Model::modelRep.

Referenced by SurrBasedGlobalMinimizer::core_run(), Model::derived_interface(), and RecastModel::derived_interface().

size_t solution_levels ( bool lwr_bnd = true ) const [virtual]

number of discrete levels within solution control (SimulationModel)

return the number of levels within a solution / discretization hierarchy.

Reimplemented in SimulationModel.

References Model::modelRep, and Model::solution_levels().

Referenced by NonDMultilevelSampling::compute_error_estimates(), NonDMultilevelSampling::multilevel_control_variate_mc_Qcorr(), NonDMultilevelSampling::multilevel_control_variate_mc_Ycorr(), NonDMultilevelSampling::multilevelmc_Qsum(), NonDMultilevelSampling::multilevelmc_Ysum(), HierarchSurrModel::recursive_apply(), Model::solution_levels(), and RecastModel::solution_levels().

void solution_level_index ( unsigned short index ) [virtual]

activate a particular level within the solution level control and return the cost estimate (SimulationModel)

activate a particular level within a solution / discretization hierarchy.

Reimplemented in RecastModel, and SimulationModel.

References Dakota::abort_handler(), Model::modelRep, and Model::solution_level_index().

Referenced by HierarchSurrModel::build_approximation(), HierarchSurrModel::derived_evaluate(), HierarchSurrModel::derived_evaluate_nowait(), Model::solution_level_index(), and RecastModel::solution_level_index().

short local_eval_synchronization ( ) [virtual]

return derived model synchronization setting

SimulationModels and HierarchSurrModels redefine this virtual function.

A default value of "synchronous" prevents async local operations for:

- NestedModels: a subIterator can support message passing parallelism, but not async local.
- DataFitSurrModels: while async evals on approximations will work due to some added bookkeeping, avoiding them is preferable.

Reimplemented in RecastModel, NestedModel, and SimulationModel.

References Model::local_eval_synchronization(), and Model::modelRep.

Referenced by Model::init_serial(), RecastModel::local_eval_synchronization(), Model::local_eval_synchronization(), and Model::set_ie_asynchronous_mode().

int local_eval_concurrency ( ) [virtual]

return derived model asynchronous evaluation concurrency

SimulationModels and HierarchSurrModels redefine this virtual function.

Reimplemented in RecastModel, NestedModel, and SimulationModel.

References Model::local_eval_concurrency(), and Model::modelRep.

Referenced by RecastModel::local_eval_concurrency(), Model::local_eval_concurrency(), and Model::set_ie_asynchronous_mode().
**const String & interface_id ( ) const [virtual]**

return the interface identifier

return by reference requires use of dummy objects, but is important to allow use of assign_rep() since this operation must be performed on the original envelope object.

Reimplemented in **RecastModel, DataFitSurrModel, NestedModel, and SimulationModel**.

References Dakota::dummy_interface, Interface::interface_id(), Model::interface_id(), and Model::modelRep.

Referenced by NonDDREAMBayesCalibration::archive_acceptance_chain(), Minimizer::archive_best_results(),

DataFitSurrModel::import_points(), RecastModel::interface_id(), Model::interface_id(), Minimizer::local_recasttrieve(),
Analyzer::pre_output(), SurrBasedMinimizer::print_results(), LeastSq::print_results(), Optimizer::print_results(),
SeqHybridMetaIterator::run_sequential(), DiscrepancyCorrection::search_db(), Model::synchronize(),
Model::synchronize_nowait(), Analyzer::update_best(), ConcurrentMetaIterator::update_local_results(),
SeqHybridMetaIterator::update_local_results(), and NonDLocalReliability::update_mpp_search_data().

**bool evaluation_cache ( bool recurse_flag = true ) const [virtual]**

Indicates the usage of an evaluation cache by the Model.

Only Models including ApplicationInterfaces support an evaluation cache: surrogate, nested, and recast mappings are not stored in the cache. Possible exceptions: **HierarchSurrModel, NestedModel::optionalInterface**.

Reimplemented in **RecastModel, DataFitSurrModel, HierarchSurrModel, and SimulationModel**.

References Model::evaluation_cache(), and Model::modelRep.

Referenced by DataFitSurrModel::DataFitSurrModel(), DataFitSurrModel::evaluation_cache(), RecastModel::
evaluation_cache(), Model::evaluation_cache(), DataFitSurrModel::import_points(), and Analyzer::read_variables_
responses().

**bool restart_file ( bool recurse_flag = true ) const [virtual]**

Indicates the usage of a restart file by the Model.

Only Models including ApplicationInterfaces interact with the restart file: surrogate, nested, and recast mappings are not stored in restart. Possible exceptions: **DataFitSurrModel::import_points(), NestedModel::optionalInterface**.

Reimplemented in **RecastModel, DataFitSurrModel, HierarchSurrModel, and SimulationModel**.

References Model::modelRep, and Model::restart_file().

Referenced by DataFitSurrModel::import_points(), Analyzer::read_variables_responses(), DataFitSurrModel::
restart_file(), RecastModel::restart_file(), and Model::restart_file().

**void eval_tag_prefix ( const String & eval_id_str ) [virtual]**

set the hierarchical eval ID tag prefix

Derived classes containing additional models or interfaces should implement this function to pass along to their sub Models/Interfaces.

Reimplemented in **RecastModel, and SimulationModel**.

References Model::eval_tag_prefix(), Model::evalTagPrefix, and Model::modelRep.

Referenced by HierarchSurrModel::build_approximation(), HierarchSurrModel::derived_evaluate(), DataFitSurrModel::
derived_evaluate(), HierarchSurrModel::derived_evaluate_nowait(), DataFitSurrModel::derived_evaluate_
nowait(), Iterator::eval_tag_prefix(), Model::eval_tag_prefix(), and RecastModel::eval_tag_prefix().
ModelList & subordinate_models ( bool recurse_flag = true )

return the sub-models in nested and surrogate models

since modelList is built with list insertions (using envelope copies), these models may not be used for model::assign_rep() since this operation must be performed on the original envelope object. They may, however, be used for letter-based operations (including assign_rep()) on letter contents such as an interface.

References Model::derived_subordinate_models(), Model::modelList, Model::modelRep, and Model::subordinate_models().

Referenced by NonDExpansion::configure_cost(), NonDExpansion::configure_levels(), Model::manage_data_recastings(), NonDLocalInterval::NonDLocalInterval(), NonDLocalReliability::NonDLocalReliability(), NonD-MultilevelSampling::NonD-MultilevelSampling(), SOLBase::SOLBase(), and Model::subordinate_models().

void init_communicators ( ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag = true )

allocate communicator partitions for a model and store configuration in modelPCIterMap

The init_communicators() and derived_init_communicators() functions are stuctured to avoid performing the messageLengths estimation more than once. init_communicators() (not virtual) performs the estimation and then forwards the results to derived_init_communicators (virtual) which uses the data in different contexts.

References ParallelLibrary::bcast(), Model::derived_init_communicators(), Model::estimate_message_lengths(), ParallelLibrary::increment_parallel_configuration(), Model::init_communicators(), Model::initCommsBcastFlag, Model::messageLengths, Model::modelPCIter, Model::modelPCIterMap, Model::modelRep, ParallelLibrary::parallel_configuration_iterator(), ParallelLibrary::parallel_level_index(), and Model::parallelLib.

Referenced by SurrBasedMinimizer::derived_init_communicators(), NonDGlobalReliability::derived_init_communicators(), NonDLocalInterval::NonDLocalInterval(), NonDExpansion::derived_init_communicators(), NonDExpansion::NonDExpansion::derived_init_communicators(), NonDExpansion::NonDExpansion::derived_init_communicators(), NonDGlobalReliability::derived_init_communicators(), NonDGlobalReliability::derived_init_communicators(), NonDAdaptiveSampling::derived_init_communicators(), NonDAdaptiveSampling::derived_init_communicators(), NonDPolynomialChaos::derived_init_communicators(), NonDBayesCalibration::derived_init_communicators(), ActiveSubspaceModel::derived_init_communicators(), HierarchSurrModel::derived_init_communicators(), DataFitSurrModel::derived_init_communicators(), RecastModel::derived_init_communicators(), RecastModel::derived_init_communicators(), DataFitSurrModel::derived_set_communicators(), Model::init_communicators(), and Model::serve_init_communicators().

void init_serial ( )

for cases where init_communicators() will not be called, modify some default settings to behave properly in serial.

The init_serial() and derived_init_serial() functions are stuctured to separate base class (common) operations from derived class (specialized) operations.

References Model::asynchEvalFlag, Model::derived_init_serial(), Model::init_serial(), Model::local_eval_synchronization(), and Model::modelRep.

Referenced by NestedModel::derived_init_serial(), HierarchSurrModel::derived_init_serial(), DataFitSurrModel::derived_init_serial(), RecastModel::derived_init_serial(), and Model::init_serial().

void estimate_message_lengths ( )

estimate messageLengths for a model

This functionality has been pulled out of init_communicators() and defined separately so that it may be used in those cases when messageLengths is needed but model.init_communicators() is not called, e.g., for the master processor in the self-scheduling of a concurrent iterator strategy.

References Response::active_set_derivative_vector(), Model::aleatDistParams, Response::copy(), Variables::copy(), Model::currentResponse, Model::currentVariables, Variables::cv(), Model::discreteDesignSetStringValues, Model::discreteStateSetStringValues, Model::epistDistParams, Model::estimate_message_lengths(), Variables::icv(),

_communicators(), AdaptedBasisModel::serve_init_mapping(), and ActiveSubspaceModel::serve_init_mapping().

bool manage_data_recastings(
  )
initialize modelList and recastFlags for data import/export

  Constructor helper to manage model recastings for data import/export.

  References Model::manage_data_recastings(), Model::modelRep, Model::recastFlags, and Model::subordinate_ 
_models().

  Referenced by DataFitSurrModel::DataFitSurrModel(), Model::manage_data_recastings(), and Analyzer::read_ 
_variables_responses().

void assign_rep(
  Model * model_rep, bool ref_count_incr = true
)
replaces existing letter with a new one

  Similar to the assignment operator, the assign_rep() function decrements referenceCount for the old model- 
Rep and assigns the new modelRep. It is different in that it is used for publishing derived class letters to existing 
envelopes, as opposed to sharing representations among multiple envelopes (in particular, assign_rep is passed a 
letter object and operator= is passed an envelope object). Letter assignment supports two models as governed by 
ref_count_incr:

  • ref_count_incr = true (default): the incoming letter belongs to another envelope. In this case, increment the 
reference count in the normal manner so that deallocation of the letter is handled properly.

  • ref_count_incr = false: the incoming letter is instantiated on the fly and has no envelope. This case is 
modeled after get_model(): a letter is dynamically allocated using new and passed into assign_rep, the 
letter’s reference count is not incremented, and the letter is not remotely deleted (its memory management 
is passed over to the envelope).

References Dakota::abort_handler(), Model::modelRep(), Model::modelRep, and Model::referenceCount.

int derivative_concurrency(
  ) const
return the gradient concurrency for use in parallel configuration logic

  This function assumes derivatives with respect to the active continuous variables. Therefore, concurrency with 
respect to the inactive continuous variables is not captured.
References Dakota::contains(), Model::derivative_concurrency(), Model::gradIdAnalytic, Model::gradientType, Model::hessianType, Model::hessIdNumerical, Model::intervalType, Model::methodSource, Model::modelRep, and Model::numDerivVars.

Referenced by ActiveSubspaceModel::ActiveSubspaceModel(), Model::derivative_concurrency(), HierarchSurrModel::derived_free_communicators(), HierarchSurrModel::derived_init_communicators(), DataFitSurrModel::derived_init_communicators(), HierarchSurrModel::derived_set_communicators(), DataFitSurrModel::estimate_partition_bounds(), NonDExpansion::initialize_u_space_model(), Analyzer::num_samples(), HierarchSurrModel::serve_run(), and Iterator::update_from_model().

void active_variables ( const RealVector & config_vars, Model & model ) [static]

set the specified configuration to the Model’s inactive vars, converting from real to integer or through index to string value as needed

config_vars consists of [continuous, integer, string, real].

References Model::continuous_variables(), Model::current_variables(), Model::cv(), Model::discrete_int_variables(), Model::discrete_real_variables(), Model::discrete_set_string_values(), Variables::discrete_string_variable(), Model::div(), Model::drv(), Model::dsv(), Dakota::iround(), and Dakota::set_index_to_value().

void inactive_variables ( const RealVector & config_vars, Model & model ) [static]

set the specified configuration to the Model’s inactive vars, converting from real to integer or through index to string value as needed

config_vars consists of [continuous, integer, string, real].

References Model::current_variables().

Referenced by DataTransformModel::archive_submodel_responses(), NonDBayesCalibration::calibrate_to_hifi(), DataTransformModel::derived_evaluate(), DataTransformModel::derived_evaluate_nowait(), NonDBayesCalibration::export_discrepancy(), and NonDBayesCalibration::export_field_discrepancy().

void inactive_variables ( const RealVector & config_vars, Model & model, Variables & vars ) [static]

config_vars consists of [continuous, integer, string, real].

References Model::current_variables(), Model::discrete_set_string_values(), Model::icv(), Model::idiv(), Model::idrv(), Model::dsv(), Variables::inactive_continuous_variables(), Variables::inactive_discrete_int_variables(), Variables::inactive_discrete_real_variables(), Variables::inactive_discrete_string_variable(), Dakota::iround(), Dakota::set_index_to_value(), and Variables::view().

String user_auto_id ( ) [static], [protected]

return the next available model ID for no-ID user methods

Rationale: The parser allows multiple user-specified models with empty (unspecified) ID. However, only a single Model with empty ID can be constructed (if it’s the only one present, or the “last one parsed”). Therefore decided to prefer NO_MODEL_ID over NO_MODEL_ID_<num> for (some) consistency with interface NO_ID convention. MODEL was inserted in the middle to distinguish “anonymous” MODELS from methods and interfaces in the hdf5 output. Note that this function is not used to name recast models; see their constructors for how its done.

Referenced by Model::Model().

String no_spec_id ( ) [static], [protected]

return the next available model ID for on-the-fly methods
Rationale: For now NOSPEC_MODEL_ID_ is chosen due to historical id=“NO_SPECIFICATION” used for internally-constructed Models. Longer-term, consider auto-generating an ID that includes the context from which the method is constructed, e.g., the parent method or model’s ID, together with its name. Note that this function is not used to name recast models; see their constructors for how its done.

References Model::noSpecIdNum.

Model * get_model ( ProblemDescDB & problem_db ) [private]

Used by the envelope to instantiate the correct letter class.

Used only by the envelope constructor to initialize modelRep to the appropriate derived type, as given by the modelType attribute.

References ProblemDescDB::get_string(), Model::model_type(), and Model::modelType.

Referenced by Model::Model().

int estimate_derivatives ( const ShortArray & map_asv, const ShortArray & fd_grad_asv, const ShortArray & fd_hess_asv, const ShortArray & quasi_hess_asv, const ActiveSet & original_set, const bool asynch_flag ) [private]

evaluate numerical gradients using finite differences. This routine is selected with "method_source dakota" (the default method_source) in the numerical gradient specification.

Estimate derivatives by computing finite difference gradients, finite difference Hessians, and/or quasi-Newton Hessians. The total number of finite difference evaluations is returned for use by synchronize() to track response arrays, and it could be used to improve management of max_function_evaluations within the iterators. ! new logic

References Variables::all_continuous_variables(), Model::centralHess, Variables::continuous_variables(), Model::currentResponse, Model::currentVariables, Model::db_lookup(), Model::dbCaptureList, Model::dbResponseList, Model::deltaList, ActiveSet::derivative_vector(), Model::derived_evaluate(), Model::derived_evaluate_nowait(), Model::fdHessByFnStepSize, Model::fdHessByGradStepSize, Model::fdHessStepType, Model::FDstep1(), Model::FDstep2(), Dakota::find_index(), Response::function_gradients(), Response::function_values(), Model::icv(), Variables::inactive_continuous_variable_ids(), Model::initialize_h(), Model::initialize_x0_bounds(), Model::initialMapList, Model::intervalType, Model::numFns, Model::outputLevel, ActiveSet::request_vector(), Response::shared_data(), Model::shortStep, and Model::update_response().

Referenced by Model::evaluate(), and Model::evaluate_nowait().

void synchronize_derivatives ( const Variables & vars, const IntResponseMap & fd_responses, Response & new_response, const ShortArray & fd_grad_asv, const ShortArray & fd_hess_asv, const ShortArray & quasi_hess_asv, const ActiveSet & original_set ) [private]

combine results from an array of finite difference response objects (fd_grad_responses) into a single response (new_response)

Merge an array of fd_responses into a single new_response. This function is used both by synchronous evaluate() for the case of asynchronous estimate_derivatives() and by synchronize() for the case where one or more evaluate_nowait() calls has employed asynchronous estimate_derivatives()!

References Model::acv(), Variables::all_continuous_variable_ids(), Model::centralHess, Variables::continuous_variable_ids(), Model::currentResponse, Model::currentVariables, Model::cv(), Model::dbCaptureList, Model::dbResponseList, Model::deltaList, ActiveSet::derivative_vector(), Dakota::find_index(), Response::function_gradients(), Response::function_values(), Model::icv(), Variables::inactive_continuous_variable_ids(), Model::initialMapList, Model::intervalType, Model::numFns, Response::shared_data(), and Model::update_response().

Referenced by Model::evaluate(), and Model::synchronize().
void update_response ( const Variables & vars, Response & new_response, const ShortArray & fd_grad_asv, const ShortArray & fd_hess_asv, const ShortArray & quasi_hess_asv, const ActiveSet & original_set, Response & initial_map_response, const RealMatrix & new_fn_grads, const RealSymMatrixArray & new_fn_hessians ) [private]

Overlay the initial_map_response with numerically estimated new_fn_grads and new_fn_hessians to populate new_response as governed by asv vectors. Quasi-Newton secant Hessian updates are also performed here, since this is where the gradient data needed for the updates is first consolidated. Convenience function used by estimate_derivatives() for the synchronous case and by synchronize_derivatives() for the asynchronous case.

References Response::active_set_request_vector(), Variables::continuous_variable_ids(), Response::copy(), Model::currentResponse, Model::currentVariables, ActiveSet::derivative_vector(), Response::function_gradients(), Response::function_hessians(), Response::function_values(), Model::hessianType, Model::hessIdQuasi, Response::is_null(), Model::numFns, Model::outputLevel, Model::quasiHessians, ActiveSet::request_vector(), Response::reset_inactive(), Model::supportsEstimDerivs, Model::surrogate_response_mode(), and Model::update_quasi_hessians().

Referenced by Model::estimate_derivatives(), and Model::synchronize_derivatives().

void update_quasi_hessians ( const Variables & vars, Response & new_response, const ActiveSet & original_set ) [private]

perform quasi-Newton Hessian updates

quasi-Newton updates are performed for approximating response function Hessians using BFGS or SR1 formulations. These Hessians are supported only for the active continuous variables, and a check is performed on the DVV prior to invoking the function.

References Dakota::contains(), Variables::continuous_variables(), Dakota::copy_data(), Model::fnGradsPrev, Response::function_gradients(), Model::hessianType, Model::hessIdQuasi, Model::modelType, Model::numDerivVars, Model::numFns, Model::numQuasiUpdates, Model::outputLevel, Model::quasiHessians, Model::quasiHessType, ActiveSet::request_vector(), and Model::xPrev.

Referenced by Model::update_response().

bool manage_asv ( const ActiveSet & original_set, ShortArray & map_asv_out, ShortArray & fd_grad_asv_out, ShortArray & fd_hess_asv_out, ShortArray & quasi_hess_asv_out ) [private]

Coordinates usage of estimate_derivatives() calls based on asv_in.

Splits asv_in total request into map_asv_out, fd_grad_asv_out, fd_hess_asv_out, and quasi_hess_asv_out as governed by the responses specification. If the returned use_est_deriv is true, then these asv outputs are used by estimate_derivatives() for the initial map, finite difference gradient evals, finite difference Hessian evals, and quasi-Hessian updates, respectively. If the returned use_est_deriv is false, then only map_asv_out is used.

References Dakota::abort_handler(), Dakota::contains(), ActiveSet::derivative_vector(), Model::FDstep2(), Dakota::find_index(), Model::forward_grad_step(), Model::gradIdAnalytic, Model::gradIdNumerical, Model::gradientType, Model::hessianType, Model::hessIdAnalytic, Model::hessIdNumerical, Model::hessIdQuasi, Model::ignoreBounds, Model::initialize_x0_bounds(), Model::intervalType, Model::methodSource, Model::model_id(), ActiveSet::request_vector(), Model::shortStep, Model::supportsEstimDerivs, and Model::surrogate_response_mode().

Referenced by Model::evaluate(), and Model::evaluate_nowait().

Real initialize_h ( Real x_j, Real lb_j, Real ub_j, Real step_size, String step_type ) const [private]

function to determine initial finite difference h (before step length adjustment) based on type of step desired

Auxiliary function to determine initial finite difference h (before step length adjustment) based on type of step desired.

Referenced by Model::estimate_derivatives(), and Model::forward_grad_step().
CHAPTER 13. CLASS DOCUMENTATION

Real FDstep1 (Real x0_j, Real lb_j, Real ub_j, Real h_mag) [private]

function returning finite-difference step size (affected by bounds)

Auxiliary function to compute forward or first central-difference step size, honoring bounds. The first step is away from zero, when possible. Flips the direction or updates shortStep if can’t take the full requested step h_mag.

References Model::ignoreBounds, and Model::shortStep.

Referenced by Model::estimate_derivatives(), and Model::forward_grad_step().

Real FDstep2 (Real x0_j, Real lb_j, Real ub_j, Real h) [private]

function returning second central-difference step size (affected by bounds)

Auxiliary function to compute the second central-difference step size, honoring bounds.

References Model::ignoreBounds, and Model::shortStep.

Referenced by Model::estimate_derivatives(), and Model::manage_asv().

13.97.4 Member Data Documentation

RealVector fdGradStepSize [protected]

relative finite difference step size for numerical gradients

A scalar value (instead of the vector fd_gradient_step_size spec) is used within the iterator hierarchy since this attribute is only used to publish a step size to vendor numerical gradient algorithms.

Referenced by DataFitSurrModel::DataFitSurrModel(), Model::fd_gradient_step_size(), Model::forward_grad_step(), RecastModel::initialize_data_from_submodel(), and Model::Model().

RealVector fdHessByGradStepSize [protected]

relative finite difference step size for numerical Hessians estimated using first-order differences of gradients

For vendor numerical Hessian algorithms, a scalar value is used.

Referenced by DataFitSurrModel::DataFitSurrModel(), Model::estimate_derivatives(), Model::fd_hessian_by_grad_step_size(), RecastModel::initialize_data_from_submodel(), and Model::Model().

RealVector fdHessByFnStepSize [protected]

relative finite difference step size for numerical Hessians estimated using second-order differences of function values

For vendor numerical Hessian algorithms, a scalar value is used.

Referenced by DataFitSurrModel::DataFitSurrModel(), Model::estimate_derivatives(), Model::fd_hessian_by_fn_step_size(), RecastModel::initialize_data_from_submodel(), and Model::Model().

ProblemDescDB& probDescDB [protected]

class member reference to the problem description database

Iterator and Model cannot use a shallow copy of ProblemDescDB due to circular destruction dependency (reference counts can’t get to 0), since ProblemDescDB contains {iterator,model}List.

Referenced by ActiveSubspaceModel::ActiveSubspaceModel(), NestedModel::derived_init_communicators(), HierarchSurrModel::derived_init_communicators(), DataFitSurrModel::derived_init_communicators(), NestedModel::derived_init_serial(), SimulationModel::estimate_partition_bounds(), NestedModel::estimate_partition_bounds(), HierarchSurrModel::estimate_partition_bounds(), DataFitSurrModel::estimate_partition_bounds(), Model::problem_description_db(), and NestedModel::update_sub_iterator().
The documentation for this class was generated from the following files:

- DakotaModel.hpp
- DakotaModel.cpp

13.98 MPIManager Class Reference

Class MPIManager to manage Dakota’s MPI world, which may be a subset of MPI_COMM_WORLD.

Public Member Functions

- MPIManager ()
  Default constructor; Dakota will not call MPI_Init.
- MPIManager (int &argc, char **&argv)
  Command-line constructor; parses MPI arguments during call to MPI_Init.
- MPIManager (MPI_Comm dakota_mpi_comm)
  Construct on specified MPI_Comm.
- ~MPIManager ()
  Destructor: calls finalize if Dakota owns MPI
- MPI_Comm dakota_mpi_comm () const
  Get the MPI_Comm on which Dakota is running
- int world_rank () const
  Get the rank of this process in Dakota's MPI_Comm
- int world_size () const
  Get the size of the MPI_Comm on which Dakota is running
- bool mpirun_flag () const
  True when Dakota is running in MPI mode

Static Public Member Functions

- static bool detect_parallel_launch (int &argc, char **&argv)
  Detect parallel launch of Dakota using mpirun/mpiexec/poe/etc. based on command line arguments and environment variables

Private Attributes

- MPI_Comm dakotaMPIComm
  MPI_Comm on which DAKOTA is running.
- int dakotaWorldRank
  Rank in MPI_Comm in which DAKOTA is running
- int dakotaWorldSize
  Size of MPI_Comm in which DAKOTA is running
- bool mpirunFlag
  Flag for a parallel mpirun/yod launch
- bool ownMPIFlag
  Flag for ownership of MPI_Init/MPI_Finalize
13.98.1 Detailed Description

Class MPIManager to manage Dakota’s MPI world, which may be a subset of MPI_COMM_WORLD.

The documentation for this class was generated from the following files:

- MPIManager.hpp
- MPIManager.cpp

13.99 MPIPackBuffer Class Reference

Class for packing MPI message buffers.

Public Member Functions

- **MPIPackBuffer (int size=1024)**
  Constructor, which allows the default buffer size to be set.

- **~MPIPackBuffer ()**
  Destructor.

- **const char * buf ()**
  Returns a pointer to the internal buffer that has been packed.

- **int size ()**
  The number of bytes of packed data.

- **int capacity ()**
  the allocated size of Buffer.

- **void reset ()**
  Resets the buffer index in order to reuse the internal buffer.

- **void pack (const int *data, const int num=1)**
  Pack one or more int’s.

- **void pack (const u_int *data, const int num=1)**
  Pack one or more unsigned int’s.

- **void pack (const long *data, const int num=1)**
  Pack one or more long’s.

- **void pack (const u_long *data, const int num=1)**
  Pack one or more unsigned long’s.

- **void pack (const short *data, const int num=1)**
  Pack one or more short’s.

- **void pack (const u_short *data, const int num=1)**
  Pack one or more unsigned short’s.

- **void pack (const char *data, const int num=1)**
  Pack one or more char’s.

- **void pack (const u_char *data, const int num=1)**
  Pack one or more unsigned char’s.

- **void pack (const double *data, const int num=1)**
  Pack one or more double’s.

- **void pack (const float *data, const int num=1)**
  Pack one or more float’s.
Pack one or more float's.
- void pack (const bool *data, const int num=1)

Pack one or more bool's.
- void pack (const int &data)

Pack a int.
- void pack (const u_int &data)

Pack a unsigned int.
- void pack (const long &data)

Pack a long.
- void pack (const u_long &data)

Pack a unsigned long.
- void pack (const short &data)

Pack a short.
- void pack (const u_short &data)

Pack a unsigned short.
- void pack (const char &data)

Pack a char.
- void pack (const u_char &data)

Pack a unsigned char.
- void pack (const double &data)

Pack a double.
- void pack (const float &data)

Pack a float.
- void pack (const bool &data)

Pack a bool.

Protected Member Functions
- void resize (const int newsize)

Resizes the internal buffer.

Protected Attributes
- char * Buffer
  The internal buffer for packing.
- int Index
  The index into the current buffer.
- int Size
  The total size that has been allocated for the buffer.
13.99.1 Detailed Description

Class for packing MPI message buffers.

A class that provides a facility for packing message buffers using the MPI_Pack facility. The MPIPackBuffer class dynamically resizes the internal buffer to contain enough memory to pack the entire object. When deleted, the MPIPackBuffer object deletes this internal buffer. This class is based on the Dakota_Version_3.0 version of utilib::PackBuffer from utilib/src/io/PackBuf.[cpp,h]

The documentation for this class was generated from the following files:

- MPIPackBuffer.hpp
- MPIPackBuffer.cpp

13.100 MPIUnpackBuffer Class Reference

Class for unpacking MPI message buffers.

Public Member Functions

- void setup (char *buf_, int size_, bool flag_=false)
  Method that does the setup for the constructors.
- MPIUnpackBuffer ()
  Default constructor.
- MPIUnpackBuffer (int size_)
  Constructor that specifies the size of the buffer.
- MPIUnpackBuffer (char *buf_, int size_, bool flag_=false)
  Constructor that sets the internal buffer to the given array.
- ~MPIUnpackBuffer ()
  Destructor.
- void resize (const int newsize)
  Resizes the internal buffer.
- const char * buf ()
  Returns a pointer to the internal buffer.
- int size ()
  Returns the length of the buffer.
- int curr ()
  Returns the number of bytes that have been unpacked from the buffer.
- void reset ()
  Resets the index of the internal buffer.
- void unpack (int *data, const int num=1)
  Unpack one or more int's.
- void unpack (u_int *data, const int num=1)
  Unpack one or more unsigned int's.
- void unpack (long *data, const int num=1)
  Unpack one or more long's.
- void unpack (u_long *data, const int num=1)
Unpack one or more unsigned long's.
• void unpack (short *data, const int num=1)

Unpack one or more short's.
• void unpack (u_short *data, const int num=1)

Unpack one or more unsigned short's.
• void unpack (char *data, const int num=1)

Unpack one or more char's.
• void unpack (u_char *data, const int num=1)

Unpack one or more unsigned char's.
• void unpack (double *data, const int num=1)

Unpack one or more double's.
• void unpack (float *data, const int num=1)

Unpack one or more float's.
• void unpack (bool *data, const int num=1)

Unpack one or more bool's.
• void unpack (int &data)

Unpack a int.
• void unpack (u_int &data)

Unpack a unsigned int.
• void unpack (long &data)

Unpack a long.
• void unpack (u_long &data)

Unpack a unsigned long.
• void unpack (short &data)

Unpack a short.
• void unpack (u_short &data)

Unpack a unsigned short.
• void unpack (char &data)

Unpack a char.
• void unpack (u_char &data)

Unpack a unsigned char.
• void unpack (double &data)

Unpack a double.
• void unpack (float &data)

Unpack a float.
• void unpack (bool &data)

Unpack a bool.
Protected Attributes

- char * Buffer
  The internal buffer for unpacking.
- int Index
  The index into the current buffer.
- int Size
  The total size that has been allocated for the buffer.
- bool ownFlag
  If TRUE, then this class owns the internal buffer.

13.100.1 Detailed Description

Class for unpacking MPI message buffers.
A class that provides a facility for unpacking message buffers using the MPI Unpack facility. This class is based on the Dakota Version 3.0 version of utilib::UnPackBuffer from utilib/src/io/PackBuf.[cpp,h]
The documentation for this class was generated from the following files:

- MPIPackBuffer.hpp
- MPIPackBuffer.cpp

13.101 NCSUTraits Class Reference

Wrapper class for the NCSU DIRECT optimization library.
Inheritance diagram for NCSUTraits:

```
TraitsBase
  NCSUTraits
```

Public Member Functions

- NCSUTraits ()
  default constructor
- virtual ~NCSUTraits ()
  destructor
- virtual bool is_derived ()
  A temporary query used in the refactor.
- bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.
13.101.1 Detailed Description

Wrapper class for the NCSU DIRECT optimization library.

The NCSUOptimizer class provides a wrapper for a Fortran 77 implementation of the DIRECT algorithm developed at North Carolina State University. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: A version of TraitsBase specialized for NCSU optimizers.

The documentation for this class was generated from the following file:

- NCSUOptimizer.hpp

13.102 NestedModel Class Reference

Derived model class which performs a complete sub-iterator execution within every evaluation of the model.

Inheritance diagram for NestedModel:

```
Model

+---------------+---------------+---------------+
|               | NestedModel   |               |
| Model          |               |               |
```

Public Member Functions

- **NestedModel (ProblemDescDB &problem_db)**
  
  *constructor*

- **~NestedModel ()**
  
  *destructor*

- **void declare_sources ()**
  
  *Declare a model’s sources to the evaluationsDB.*

Protected Member Functions

- **void derived_evaluate (const ActiveSet &set)**
  
  *portion of evaluate() specific to NestedModel*

- **void derived_evaluate_nowait (const ActiveSet &set)**
  
  *portion of evaluate_nowait() specific to NestedModel*

- **const IntResponseMap & derived_synchronize ()**
  
  *portion of synchronize() specific to NestedModel*

- **Iterator & subordinate_iterator ()**
  
  *return subIterator*

- **Model & subordinate_model ()**
  
  *return subModel*

- **void derived_subordinate_models (ModelList &ml, bool recurse_flag)**
  
  *return subModel*
• **Interface & derived_interface ()**
  
  return optionalInterface

• **const RealVector & error_estimates ()**
  
  retrieve error estimates corresponding to the subIterator’s response results (e.g., statistical MSE for subordinate UQ).

• **void surrogate_response_mode (short mode)**
  
  pass a bypass request on to the subModel for any lower-level surrogates

• **void component_parallel_mode (short mode)**
  
  update component parallel mode for supporting parallelism in optionalInterface and subModel

• **size_t mi_parallel_level_index () const**
  
  return sub IteratorSched.miPLIndex

• **short local_eval_synchronization ()**
  
  return optionalInterface synchronization setting

• **int local_evalConcurrency ()**
  
  return optionalInterface asynchronous evaluation concurrency

• **bool derived_master_overload () const**
  
  flag which prevents overloading the master with a multiprocessor evaluation (forwarded to optionalInterface)

• **IntIntPair estimate_partition_bounds (int max_eval_concurrency)**
  
  estimate the minimum and maximum partition sizes that can be utilized by this Model

• **void derived_init_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)**
  
  set up optionalInterface and subModel for parallel operations

• **void derived_init_serial ()**
  
  set up optionalInterface and subModel for serial operations.

• **void derived_set_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)**
  
  set active parallel configuration within subModel

• **void derived_free_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)**
  
  deallocate communicator partitions for the NestedModel (forwarded to optionalInterface and subModel)

• **void serve_run (ParLevLIter pl_iter, int max_eval_concurrency)**
  
  Service optionalInterface and subModel job requests received from the master. Completes when a termination message is received from stop_servers().

• **void stop_servers ()**
  
  Executed by the master to terminate server operations for subModel and optionalInterface when iteration on the NestedModel is complete.

• **const String & interface_id () const**
  
  return the optionalInterface identifier

• **int derived_evaluation_id () const**
  
  Return the current evaluation id for the NestedModel.

• **void set_evaluation_reference ()**
  
  set the evaluation counter reference points for the NestedModel (request forwarded to optionalInterface and subModel)

• **void fine_grained_evaluation_counters ()**
  
  request fine-grained evaluation reporting within optionalInterface and subModel

• **void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const**
print the evaluation summary for the NestedModel (request forwarded to optionalInterface and subModel)

- void warm_start_flag (const bool flag)
  set the warm start flag, including actualModel
- void initialize_iterator (int job_index)
- void pack_parameters_buffer (MPIPackBuffer &send_buffer, int job_index)
- void unpack_parameters_buffer (MPIUnpackBuffer &recv_buffer, int job_index)
- void unpack_parameters_initialize (MPIUnpackBuffer &recv_buffer, int job_index)
- void pack_results_buffer (MPIPackBuffer &send_buffer, int job_index)
- void unpack_results_buffer (MPIUnpackBuffer &recv_buffer, int job_index)
- void update_local_results (int job_index)
- ActiveSet default_interface_active_set ()

Private Member Functions

- void update_sub_iterator ()
  update subIterator with mapping data and set subIterator-based counts
- PRPQueue<job_index> to queue_iterator (int job_index)
  convert job_index to an eval_id through subIteratorIdMap and eval_id to a subIteratorPRPQueue queue iterator
- void initialize_iterator (const Variables &vars, const ActiveSet &set, int eval_id)
  lower level function shared by initialize_iterator(int) and unpack_parameters_initialize()
- void unpack (MPIUnpackBuffer &recv_buffer, int job_index, Variables &vars, ActiveSet &set, int &eval_id)
  lower level function shared by unpack_parameters_buffer() and unpack_parameters_initialize()
- void resolve_real_variable_mapping (const String &map1, const String &map2, size_t curr_index, short &inactive_sm_view)
  for a named real mapping, resolve primary index and secondary target
- void resolve_integer_variable_mapping (const String &map1, const String &map2, size_t curr_index, short &inactive_sm_view)
  for a named integer mapping, resolve primary index and secondary target
- void resolve_string_variable_mapping (const String &map1, const String &map2, size_t curr_index, short &inactive_sm_view)
  for a named string mapping, resolve primary index and secondary target
- size_t sm_acv_index_map (size_t pacvm_index, short sacvm_target)
  offset pacvm_index based on sacvm_target to create mapped_index
- size_t sm_adiv_index_map (size_t padivm_index, short sadivm_target)
  offset padivm_index based on sadivm_target to create mapped_index
- size_t sm_adsv_index_map (size_t padsvm_index, short sadsvm_target)
  offset padsvm_index based on sadsvm_target to create mapped_index
- size_t sm_adrv_index_map (size_t padrvm_index, short sadrvm_target)
  offset padrvm_index based on sadrvm_target to create mapped_index
- size_t cv_index_map (size_t cv_index, const Variables &vars)
  offset cv_index to create index into aggregated primary/secondary arrays
- size_t div_index_map (size_t div_index, const Variables &vars)
  offset div_index to create index into aggregated primary/secondary arrays
- size_t dsv_index_map (size_t dsv_index, const Variables &vars)
offset dsv_index to create index into aggregated primary/secondary arrays

- size_t drv_index_map (size_t drv_index, const Variables &vars)
  offset drv_index to create index into aggregated primary/secondary arrays

- size_t ccv_index_map (size_t ccv_index, const Variables &vars)
  offset active complement ccv_index to create index into all continuous arrays

- size_t cdv_index_map (size_t cdv_index, const Variables &vars)
  offset active complement cdv_index to create index into all discrete int arrays

- size_t cdsv_index_map (size_t cdsv_index, const Variables &vars)
  offset active complement cdsv_index to create index into all discrete string arrays

- size_t cdrv_index_map (size_t cdrv_index, const Variables &vars)
  offset active complement cdrv_index to create index into all discrete real arrays

- void real_variable_mapping (const Real &r_var, size_t mapped_index, short svm_target)
  insert r_var into appropriate recipient

- void integer_variable_mapping (const int &i_var, size_t mapped_index, short svm_target)
  insert i_var into appropriate recipient

- void string_variable_mapping (const String &s_var, size_t mapped_index, short svm_target)
  insert s_var into appropriate recipient

- void set_mapping (const ActiveSet &mapped_set, ActiveSet &interface_set, bool &opt_interface_map, ActiveSet &sub_iterator_set, bool &sub_iterator_map)
  define the evaluation requirements for the optionalInterface (interface_set) and the subIterator (sub_iterator_set) from the total model evaluation requirements (mapped_set)

- void response_mapping (const Response &interface_response, const Response &sub_iterator_response, Response &mapped_response)
  combine the response from the optional interface evaluation with the response from the sub-iteration using the primaryCoeffs/secondaryCoeffs mappings to create the total response for the model

- void interface_response_overlay (const Response &opt_interface_response, Response &mapped_response)
  assign the response from the optional interface evaluation within the total response for the model

- void iterator_response_overlay (const Response &sub_iterator_response, Response &mapped_response)
  overlay the sub-iteration response within the total response for the model using the primaryCoeffs/secondaryCoeffs mappings

- void iterator_error_estimation (const RealVector &sub_iterator_errors, RealVector &mapped_errors)
  combine error estimates from the sub-iteration to define mappedErrorEstimates

- Response & nested_response (int nested_cntr)
  locate existing or allocate new entry in nestedResponseMap

- void check_response_map (const ShortArray &mapped_asv)
  check function counts for the mapped_asv

- void update_inactive_view (short new_view, short &view)
  update inactive variables view for subIterator based on new_view

- void update_inactive_view (unsigned short type, short &view)
  update inactive variables view for subIterator based on type

- void update_sub_model (const Variables &vars, const Constraints &cons)
  update subModel with current variable values/bounds/labels
**Private Attributes**

- int `nestedModelEvalCntr`
  
  *number of calls to `derived_evaluate() / derived_evaluate_nowait()`*

- bool `firstUpdate`
  
  *boolean to trigger one-time updates on first call to `update_sub_model()`*

- `IntResponseMap nestedResponseMap`
  
  *used to return a map of nested responses (including subIterator and optionalInterface contributions) for aggregation and rekeying at the base class level*

- `RealVector mappedErrorEstimates`
  
  *mapping of `subIterator.response_error_estimates()` through primary and secondary mappings*

- size_t `outerMIPLIndex`
  
  *the miPLIndex for the outer parallelism context, prior to any subIterator partitioning*

- `Iterator subIterator`
  
  *the sub-iterator that is executed on every evaluation of this model*

- `Model subModel`
  
  *the sub-model used in sub-iterator evaluations*

- `PRPQueue subIteratorPRPQueue`
  
  *job queue for asynchronous execution of subIterator jobs*

- `IteratorScheduler subIteratorSched`
  
  *scheduling object for concurrent iterator parallelism*

- `String subMethodPointer`
  
  *the sub-method pointer from the nested model specification*

- int `subIteratorJobCntr`
  
  *subIterator job counter since last `synchronize()`*

- `IntIntMap subIteratorIdMap`
  
  *mapping from subIterator evaluation counter to nested model counter (different when subIterator evaluations do not occur on every nested model evaluation due to variable ASV content)*

- size_t `numSubIterFns = 0`
  
  *number of sub-iterator response functions prior to mapping*

- size_t `numSubIterMappedIneqCon = 0`
  
  *number of top-level inequality constraints mapped from the sub-iteration results*

- size_t `numSubIterMappedEqCon = 0`
  
  *number of top-level equality constraints mapped from the sub-iteration results*

- `Interface optionalInterface`
  
  *the optional interface contributes nonnested response data to the total model response*

- `String optInterfacePointer`
  
  *the optional interface pointer from the nested model specification*

- `Response optInterfaceResponse`
  
  *the response object resulting from optional interface evaluations*

- `IntIntMap optInterfaceIdMap`
  
  *mapping from optionalInterface evaluation counter to nested model counter (different when optionalInterface evaluations do not occur on every nested model evaluation due to variable ASV content)*

- size_t `numOptInterfPrimary = 0`
number of primary response functions (objective/least squares/generic functions) resulting from optional interface evaluations

- `size_t numOptInterfIneqCon = 0`
  
  number of inequality constraints resulting from optional interface evaluations

- `size_t numOptInterfEqCon = 0`
  
  number of equality constraints resulting from the optional interface evaluations

- `IntSet optInterfGradIdAnalytic`
  
  analytic IDs for mixed gradients on the optional interface

- `IntSet optInterfHessIdAnalytic`
  
  analytic IDs for mixed Hessians on the optional interface

- `String optInterfGradientType`
  
  Gradient type for the optional interface.

- `String optInterfHessianType`
  
  Hessian type for the optional interface.

- `SizetArray active1ACVarMapIndices`
  
  "primary" variable mappings for inserting active continuous currentVariables within all continuous subModel variables. If there are no secondary mappings defined, then the insertions replace the subModel variable values.

- `SizetArray active1ADIVarMapIndices`
  
  "primary" variable mappings for inserting active discrete int currentVariables within all discrete int subModel variables. No secondary mappings are defined for discrete int variables, so the active variables replace the subModel variable values.

- `SizetArray active1ADSVarMapIndices`
  
  "primary" variable mappings for inserting active discrete string currentVariables within all discrete string subModel variables. No secondary mappings are defined for discrete string variables, so the active variables replace the subModel variable values.

- `SizetArray active1ADRVarMapIndices`
  
  "primary" variable mappings for inserting active discrete real currentVariables within all discrete real subModel variables. No secondary mappings are defined for discrete real variables, so the active variables replace the subModel variable values.

- `ShortArray active2ACVarMapTargets`
  
  "secondary" variable mappings for inserting active discrete int currentVariables into sub-parameters (e.g., distribution parameters for uncertain variables or bounds for continuous design/state variables) within all continuous subModel variables.

- `ShortArray active2ADIVarMapTargets`
  
  "secondary" variable mappings for inserting active discrete int currentVariables into sub-parameters (e.g., bounds for discrete design/state variables) within all discrete int subModel variables.

- `ShortArray active2ADSVarMapTargets`
  
  "secondary" variable mappings for inserting active discrete string currentVariables into sub-parameters (e.g., bounds for discrete design/state variables) within all discrete string subModel variables.

- `ShortArray active2ADRVarMapTargets`
  
  "secondary" variable mappings for inserting active discrete real currentVariables into sub-parameters (e.g., bounds for discrete design/state variables) within all discrete real subModel variables.

- `SizetArray complement1ACVarMapIndices`
  
  "primary" variable mappings for inserting the complement of the active continuous currentVariables within all continuous subModel variables;
"primary" variable mappings for inserting the complement of the active discrete int currentVariables within all
discrete int subModel variables

• SizeArray complement1ADSVarMapIndices
  "primary" variable mappings for inserting the complement of the active discrete string currentVariables within all
discrete string subModel variables

• SizeArray complement1ADRVarMapIndices
  "primary" variable mappings for inserting the complement of the active discrete real currentVariables within all
discrete real subModel variables

• BitArray extraCVarsData
  flags for updating subModel continuous bounds and labels, one for each active continuous variable in current-
Variables

• BitArray extraDIVarsData
  flags for updating subModel discrete int bounds and labels, one for each active discrete int variable in current-
Variables

• BitArray extraDSVarsData
  flags for updating subModel discrete string labels, one for each active discrete string variable in currentVariables

• BitArray extraDRVarsData
  flags for updating subModel discrete real bounds and labels, one for each active discrete real variable in current-
Variables

• bool identityRespMap = false
  whether identity response mapping is active

• size_t subIterMappedPri = 0
  number of sub-iterator results functions mapped to nested model primary functions (cached for use with identity
case)

• size_t subIterMappedSec = 0
  number of sub-iterator results functions mapped to nested model secondary functions (cached for use with identity
case)

• RealMatrix primaryRespCoeffs
  "primary" response mapping matrix applied to the sub-iterator response functions. For OUU, the matrix is applied
to UQ statistics to create contributions to the top-level objective functions/least squares/ generic response terms.

• RealMatrix secondaryRespCoeffs
  "secondary" response mapping matrix applied to the sub-iterator response functions. For OUU, the matrix is applied
to UQ statistics to create contributions to the top-level inequality and equality constraints.

13.102.1 Detailed Description

Derived model class which performs a complete sub-iterator execution within every evaluation of the model.

The NestedModel class nests a sub-iterator execution within every model evaluation. This capability is most
commonly used for optimization under uncertainty, in which a nondeterministic iterator is executed on every
optimization function evaluation. The NestedModel also contains an optional interface, for portions of the model
evaluation which are independent from the sub-iterator, and a set of mappings for combining sub-iterator and
optional interface data into a top level response for the model.
13.102.2 Member Function Documentation

void derived_evaluate ( const ActiveSet & set ) [protected], [virtual]

portion of evaluate() specific to NestedModel

Update subModel’s inactive variables with active variables from currentVariables, compute the optional interface and sub-iterator responses, and map these to the total model response.

Reimplemented from Model.

References NestedModel::active2ACVarMapTargets, Response::active_set(), Interface::analysis_components(), ParallelLibrary::bcast(), ParallelLibrary::bcast_hs(), NestedModel::component_parallel_mode(), Model::currentVariables, Interface::eval_tag_prefix(), Iterator::eval_tag_prefix(), Model::evalTagPrefix, Interface::evaluation_id(), Model::evaluationsDB, Model::hierarchicalTagging, NestedModel::interface_id(), NestedModel::interface_response_overlay(), Model::interfEvaluationsDBState, NestedModel::iterator_response_overlay(), IteratorScheduler::iteratorCommSize, IteratorScheduler::iteratorScheduling, Interface::map(), IteratorScheduler::messagePass, Interface::interfaceId(), Model::modelId, Model::modelPCIter, NestedModel::nestedModelEvalCntr, NestedModel::optInterfaceResponse, NestedModel::optionalInterface, Model::outputLevel, ParallelLibrary::parallel_configuration_iterator(), Model::parallelLib, IteratorScheduler::peerAssignJobs, Response::reset(), Iterator::response_results(), Iterator::response_results_active_set(), Iterator::run(), IteratorScheduler::run_iterator(), NestedModel::set_mapping(), IteratorScheduler::stop_iterator_servers(), NestedModel::subIterator, NestedModel::subIteratorSched, NestedModel::update_sub_model(), and Model::userDefinedConstraints.

void derived_evaluate_nowait ( const ActiveSet & set ) [protected], [virtual]

portion of evaluate_nowait() specific to NestedModel

Asynchronous execution of subIterator on subModel and, optionally, optionalInterface.

Reimplemented from Model.

References Response::active_set(), Interface::analysis_components(), Model::currentResponse, Model::currentVariables, Interface::evaluation_id(), Model::evaluationsDB, NestedModel::interface_id(), Model::interfEvaluationsDBState, Interface::map(), Iterator::method_id(), Model::modelId, NestedModel::nestedModelEvalCntr, NestedModel::optInterfaceIdMap, NestedModel::optInterfaceResponse, NestedModel::optionalInterface, Iterator::response_results(), Iterator::response_results_active_set(), NestedModel::set_mapping(), NestedModel::subIterator, NestedModel::subIteratorIdMap, NestedModel::subIteratorJobCntr, NestedModel::subIteratorPRPQueue.

const IntResponseMap & derived_synchronize ( ) [protected], [virtual]

portion of synchronize() specific to NestedModel

Recovery of asynchronous subIterator executions and, optionally, asynchronous optionalInterface mappings.

Reimplemented from Model.

References Interface::cache_unmatched_response(), NestedModel::component_parallel_mode(), NestedModel::interface_response_overlay(), NestedModel::iterator_response_overlay(), Model::modelPCIter, NestedModel::nested_response(), NestedModel::nestedResponseMap, IteratorScheduler::numIteratorJobs, NestedModel::optInterfaceIdMap, NestedModel::optInterfacePointer, NestedModel::optionalInterface, ParallelLibrary::parallel_configuration_iterator(), Model::parallelLib, IteratorScheduler::schedule_iterators(), NestedModel::subIterator, NestedModel::subIteratorIdMap, NestedModel::subIteratorJobCntr, NestedModel::subIteratorPRPQueue, NestedModel::subIteratorSched, and Interface::synchronize().

short local_eval_synchronization ( ) [inline], [protected], [virtual]

return optionalInterface synchronization setting

Used in setting Model::asynchEvalFlag. subModel synchronization is used for setting asynchEvalFlag within subModel.
Reimplemented from Model.
References Interface::asynch_local_evaluation_concurrency(), Interface::interface_synchronization(), NestedModel::optInterfacePointer, and NestedModel::optionalInterface.

```cpp
int local_eval_concurrency() [inline], [protected], [virtual]
```

return optionalInterface asynchronous evaluation concurrency

Used in setting Model::evaluationCapacity. subModel concurrency is used for setting evaluationCapacity within subModel.

Reimplemented from Model.
References Interface::asynch_local_evaluation_concurrency(), NestedModel::optInterfacePointer, and NestedModel::optionalInterface.

```cpp
bool derived_master_overload() const [inline], [protected], [virtual]
```

flag which prevents overloading the master with a multiprocessor evaluation (forwarded to optionalInterface)

Derived master overload for subModel is handled separately in subModel.evaluate() within subIterator.run().

Reimplemented from Model.
References Iterator::is_null(), Interface::iterator_eval_dedicated_master(), IteratorScheduler::iteratorScheduling, Interface::multi_proc_eval(), NestedModel::optInterfacePointer, NestedModel::optionalInterface, IteratorScheduler::procsPerIterator, NestedModel::subIterator, and NestedModel::subIteratorSched.

```cpp
void derived_init_communicators( ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag = true ) [protected], [virtual]
```

set up optionalInterface and subModel for parallel operations

Asynchronous flags need to be initialized for the subModel. In addition, max_eval_concurrency is the outer level iterator concurrency, not the subIterator concurrency that subModel will see, and recomputing the message_lengths on the subModel is probably not a bad idea either. Therefore, recompute everything on subModel using init_communicators().

Reimplemented from Model.
References Response::active_set(), IteratorScheduler::configure(), Model::currentVariables, ProblemDescDB::get_db_method_node(), ProblemDescDB::get_db_model_node(), Interface::init_communicators(), IteratorScheduler::init_iterator(), Iterator::is_null(), IteratorScheduler::iterator_message_lengths(), IteratorScheduler::iteratorServerId, Model::messageLengths, IteratorScheduler::messagePass, Model::modelPCIter, IteratorScheduler::numIteratorServers, NestedModel::optInterfacePointer, NestedModel::optionalInterface, ParallelLibrary::parallel_configuration_iterator(), Model::parallelLib, IteratorScheduler::partition(), Model::probDescDB, MPIPackBuffer::reset(), Iterator::response_results(), ProblemDescDB::set_db_list_nodes(), ProblemDescDB::set_db_method_node(), ProblemDescDB::set_db_model_nodes(), MPIPackBuffer::size(), NestedModel::subIterator, NestedModel::subModel, NestedModel::subMethodPointer, NestedModel::subModel, IteratorScheduler::update(), and NestedModel::update_sub_iterator().

```cpp
int derived_evaluation_id() const [inline], [protected], [virtual]
```

Return the current evaluation id for the NestedModel.

return the top level nested evaluation count. To get the lower level eval count, the subModel must be explicitly queried. This is consistent with the eval counter definitions in surrogate models.

Reimplemented from Model.
References NestedModel::nestedModelEvalCntr.
size_t cv_index_map ( size_t cv_index, const Variables & vars ) [private]

offset cv_index to create index into aggregated primary/secondary arrays

- maps index within active continuous variables to index within aggregated active continuous/discrete-int/discrete-string/discrete-real variables.

  References SharedVariablesData::aleatory_uncertain_counts(), SharedVariablesData::design_counts(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), Dakota::svd(), and SharedVariablesData::view().

  Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

size_t div_index_map ( size_t div_index, const Variables & vars ) [private]

offset div_index to create index into aggregated primary/secondary arrays

- maps index within active discrete int variables to index within aggregated active continuous/discrete-int/discrete-string/discrete-real variables.

  References SharedVariablesData::aleatory_uncertain_counts(), Variables::cv(), SharedVariablesData::design_counts(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), SharedVariablesData::state_counts(), Dakota::svd(), and SharedVariablesData::view().

  Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

size_t dsv_index_map ( size_t dsv_index, const Variables & vars ) [private]

offset dsv_index to create index into aggregated primary/secondary arrays

- maps index within active discrete string variables to index within aggregated active continuous/discrete-int/discrete-string/discrete-string variables.

  References SharedVariablesData::aleatory_uncertain_counts(), Variables::cv(), SharedVariablesData::design_counts(), Variables::div(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), SharedVariablesData::state_counts(), Dakota::svd(), and SharedVariablesData::view().

  Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

size_t drv_index_map ( size_t drv_index, const Variables & vars ) [private]

offset drv_index to create index into aggregated primary/secondary arrays

- maps index within active discrete real variables to index within aggregated active continuous/discrete-int/discrete-string/discrete-real variables.

  References SharedVariablesData::aleatory_uncertain_counts(), Variables::cv(), SharedVariablesData::design_counts(), Variables::div(), Variables::dsv(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), SharedVariablesData::state_counts(), Dakota::svd(), and SharedVariablesData::view().

  Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

size_t ccv_index_map ( size_t ccv_index, const Variables & vars ) [private]

offset active complement ccv_index to create index into all continuous arrays

- maps index within complement of active continuous variables to index within all continuous variables.

  References Dakota::abort_handler(), SharedVariablesData::aleatory_uncertain_counts(), SharedVariablesData::design_counts(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), Dakota::svd(), and SharedVariablesData::view().

  Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().
size_t cdiv_index_map ( size_t cdiv_index, const Variables & vars ) [private]
offset active complement cdiv_index to create index into all discrete int arrays
maps index within complement of active discrete int variables to index within all discrete int variables.
References Dakota::abort_handler(), SharedVariablesData::aleatory_uncertain_counts(), SharedVariablesData::design_counts(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), Dakota::svd(), and SharedVariablesData::view().
Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

size_t cdsv_index_map ( size_t cdsv_index, const Variables & vars ) [private]
offset active complement cdsv_index to create index into all discrete string arrays
maps index within complement of active discrete string variables to index within all discrete string variables.
References Dakota::abort_handler(), SharedVariablesData::aleatory_uncertain_counts(), SharedVariablesData::design_counts(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), Dakota::svd(), and SharedVariablesData::view().
Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

size_t cdrv_index_map ( size_t cdrv_index, const Variables & vars ) [private]
offset active complement cdrv_index to create index into all discrete real arrays
maps index within complement of active discrete real variables to index within all discrete real variables.
References Dakota::abort_handler(), SharedVariablesData::aleatory_uncertain_counts(), SharedVariablesData::design_counts(), SharedVariablesData::epistemic_uncertain_counts(), Variables::shared_data(), Dakota::svd(), and SharedVariablesData::view().
Referenced by NestedModel::NestedModel(), and NestedModel::update_sub_model().

void response_mapping ( const Response & opt_interface_response, const Response & sub_iterator_response, Response & mapped_response ) [inline], [private]
combine the response from the optional interface evaluation with the response from the sub-iteration using the primaryCoeffs/secondaryCoeffs mappings to create the total response for the model

In the OUU case,
optionalInterface fns = {f}, {g} (deterministic primary functions, constraints)
subIterator fns = {S} (UQ response statistics)

Problem formulation for mapped functions:
minimize \( \{f\} + [W]\{S\} \)
subject to \( \{g\} \leq \{g\} \leq \{g\}_u \)
\( \{a\} \leq [A]\{S\} \leq \{a\}_u \)
\( \{g\} = \{g\}_t \)
\( [A]\{S\} = \{a\}_t \)

where \([W]\) is the primary_mapping_matrix user input (primaryRespCoeffs class attribute), \([A]\) is the secondary_mapping_matrix user input (secondaryRespCoeffs class attribute), \(\{\{g\}_l,\{a\}_l\}\) are the top level inequality constraint lower bounds, \(\{\{g\}_u,\{a\}_u\}\) are the top level inequality constraint upper bounds, and \(\{\{g\}_t,\{a\}_t\}\) are the top level equality constraint targets.

NOTE: optionalInterface/subIterator primary fns (obj/lsq/generic fns) overlap but optionalInterface/subIterator secondary fns (ineq/eq constraints) do not. The \([W]\) matrix can be specified so as to allow

- some purely deterministic primary functions and some combined: \([W]\) filled and \([W]\).num_rows() < \(\{f\}.length()\) [combined first] or \([W]\).num_rows() == \(\{f\}.length()\) and \([W]\) contains rows of zeros [combined last]
some combined and some purely stochastic primary functions: \([W]\) filled and \([W].\text{num\_rows()} > \{f\}.\text{length()}\)

- separate deterministic and stochastic primary functions: \([W].\text{num\_rows()} > \{f\}.\text{length()}\) and \([W]\) contains \(\{f\}.\text{length()}\) rows of zeros.

If the need arises, could change constraint definition to allow overlap as well: \(\{g, l\} \leq \{g\} + [A]\{S\} \leq \{g, u\}\) with \([A]\) usage the same as for \([W]\) above.

In the UOO case, things are simpler, just compute statistics of each optimization response function: \([W] = [I],\) \(\{f\}/[g]/[A]\) are empty.

Static Public Member Functions

• static void botch (const char *fmt,...)  
  print and error message and immediately abort
• static void check_variables (std::list<DataVariables> *)  
  check each node in a list of DataVariables, first mapping DataVariables members back to flat NIDR arrays if needed.
• static void check_responses (std::list<DataResponses> *)  
• static void check_descriptor_format (const StringArray &labels)  
  Validate format user-supplied descriptors.
static void check_descriptors_for_repeats (const StringArray &labels)
Ensure no response descriptors are repeated.

static void check_descriptors_for_repeats (const StringArray &cd_labels, const StringArray &ddr_labels, const StringArray &ddsi_labels, const StringArray &ddss_labels, const StringArray &ddsr_labels, const StringArray &cs_labels, const StringArray &csr_labels, const StringArray &dssi_labels, const StringArray &dss_labels, const StringArray &dsr_labels, const StringArray &cau_labels, const StringArray &cau_labels, const StringArray &dsau_labels, const StringArray &drau_labels, const StringArray &ceu_labels, const StringArray &dieu_labels, const StringArray &dseu_labels, const StringArray &dreu_labels)
Ensure no variable descriptors are repeated.

static void make_variable_defaults (std::list<DataVariables> *)
Bounds and initial point check and inferred bounds generation.

static void make_response_defaults (std::list<DataResponses> *)
static void squawk (const char *fmt,...)
print an error message and increment nerr, but continue

static void warn (const char *fmt,...)
print a warning

Static Public Attributes

• static NIDRProblemDescDB * pDDBInstance
    Pointer to the active object instance used within the static kwhandler functions in order to avoid the need for static
data. Only initialized when parsing an input file; will be NULL for cases of direct DB population only.

• static int nerr = 0
    number of parse error encountered

Static Private Member Functions

• static void check_variables_node (void *)
    check a single variables node; input argument v is VarInfo*

• static int check_driver (const String &an_driver, const StringArray &link_files, const StringArray &copy_files)
    tokenize and try to validate the presence of an analysis driver, potentially included in the linked or copied template files

Private Attributes

• std::list< void *> VIL
    List of VarInfo pointers, one per Variables instance.

Additional Inherited Members

13.103.1 Detailed Description
The derived input file database utilizing the new IDR parser.
The NIDRProblemDescDB class is derived from ProblemDescDB for use by the NIDR parser in processing DAKOTA input file data. For information on modifying the NIDR input parsing procedures, refer to Dakota/docs/-Dev_Spec_Change.dox. For more on the parsing technology, see "Specifying and Reading Program Input with
NIDR” by David M. Gay (report SAND2008-2261P, which is available in PDF form as http://dakota.sandia.gov/papers/nidr08.pdf). Source for the routines declared herein is NIDRProblemDescDB.cpp, in which most routines are so short that a description seems unnecessary.

### 13.103.2 Member Function Documentation

```cpp
template<>
void derived_parse_inputs ( const ProgramOptions & prog_opts ) [virtual]
```

parses the input file and populates the problem description database using NIDR.

Parse the input file using the Input Deck Reader (IDR) parsing system. IDR populates the IDRProblemDescDB object with the input file data.

Reimplemented from ProblemDescDB.

References Dakota::abort_handler(), NIDRProblemDescDB::botch(), ProblemDescDB::dataMethodList, DataMethodRep::dlDetails, DataMethodRep::dlLib, ProgramOptions::input_file(), ProgramOptions::input_string(), NIDRProblemDescDB::nerr, ProblemDescDB::parallel_library(), ProgramOptions::parser_options(), NIDRProblemDescDB::pDDInstance, and NIDRProblemDescDB::squawk().

```cpp
int check_driver ( const String & an_driver, const StringArray & link_files, const StringArray & copy_files ) [static], [private]
```

tokenize and try to validate the presence of an analysis driver, potentially included in the linked or copied template files.

returns 1 if not found, 2 if found, but not executable, 0 if found (no error) in case we want to return to error on not found...

References WorkdirHelper::find_driver(), NIDRProblemDescDB::squawk(), WorkdirHelper::tokenize_driver(), NIDRProblemDescDB::warn(), and WorkdirHelper::which().

```cpp
void make_variable_defaults ( std::list< DataVariables > * dvl ) [static]
```

Bounds and initial point check and inferred bounds generation.

Size arrays for contiguous storage of aggregated uncertain types. For each variable type, call Vgen_* to generate inferred bounds and initial point, repairing initial if needed. size the aggregate arrays for uncertain (design and state are stored separately.

  Return the flag indicating whether method supports continuous variables.

### 13.105.1 Detailed Description

Wrapper class for the NL2SOL nonlinear least squares library.

The NL2SOLLeastSq class provides a wrapper for NL2SOL (TOMS Algorithm 573), in the updated form of Port Library routines dn[fg][b ] from Bell Labs; see [http://www.netlib.org/port/readme](http://www.netlib.org/port/readme). The Fortran from Port has been turned into C by f2c. NL2SOL uses a function pointer approach for which passed functions must be either global functions or static member functions. A version of TraitsBase specialized for NL2SOL nonlinear least squares library

The documentation for this class was generated from the following file:

- NL2SOLLeastSq.hpp
13.106  NLPQLPTraits Class Reference

Wrapper class for the NLPQLP optimization library, Version 2.0.

Inheritance diagram for NLPQLPTraits:

```
NLPQLPTraits
  TraitsBase
```

Public Member Functions

- **NLPQLPTraits ()**
  default constructor
- **virtual ~NLPQLPTraits ()**
  destructor
- **virtual bool is_derived ()**
  A temporary query used in the refactor.
- **bool supports_continuous_variables ()**
  Return the flag indicating whether method supports continuous variables.
- **bool supports_linear_equality ()**
  Return the flag indicating whether method supports linear equalities.
- **bool supports_linear_inequality ()**
  Return the flag indicating whether method supports linear inequalities.
- **bool supports_nonlinear_equality ()**
  Return the flag indicating whether method supports nonlinear equalities.
- **bool supports_nonlinear_inequality ()**
  Return the flag indicating whether method supports nonlinear inequalities.
- **NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format ()**
  Return the format used for nonlinear inequality constraints.

13.106.1  Detailed Description

Wrapper class for the NLPQLP optimization library, Version 2.0.

AN IMPLEMENTATION OF A SEQUENTIAL QUADRATIC PROGRAMMING METHOD FOR SOLVING NONLINEAR OPTIMIZATION PROBLEMS BY DISTRIBUTED COMPUTING AND NON-MONOTONE LINE SEARCH

This subroutine solves the general nonlinear programming problem

\[
\begin{align*}
\text{minimize} & \quad F(X) \\
\text{subject to} & \quad G(J,X) = 0, \quad J=1,\ldots,ME \\
& \quad G(J,X) \geq 0, \quad J=ME+1,\ldots,M \\
& \quad XL \leq X \leq Xu
\end{align*}
\]
and is an extension of the code NLPQLD. NLPQLP is specifically tuned to run under distributed systems. A new input parameter L is introduced for the number of parallel computers, that is the number of function calls to be executed simultaneously. In case of L=1, NLPQLP is identical to NLPQLD. Otherwise the line search is modified to allow L parallel function calls in advance. Moreover the user has the opportunity to used distributed function calls for evaluating gradients.

The algorithm is a modification of the method of Wilson, Han, and Powell. In each iteration step, a linearly constrained quadratic programming problem is formulated by approximating the Lagrangian function quadratically and by linearizing the constraints. Subsequently, a one-dimensional line search is performed with respect to an augmented Lagrangian merit function to obtain a new iterate. Also the modified line search algorithm guarantees convergence under the same assumptions as before.

For the new version, a non-monotone line search is implemented which allows to increase the merit function in case of instabilities, for example caused by round-off errors, errors in gradient approximations, etc.

The subroutine contains the option to predetermine initial guesses for the multipliers or the Hessian of the Lagrangian function and is called by reverse communication. A version of TraitsBase specialized for NLPQLP optimizers

The documentation for this class was generated from the following file:

- NLPQLPOptimizer.hpp

### 13.107 NLSSOLLeastSqTraits Class Reference

Wrapper class for the NLSSOL nonlinear least squares library. Inheritance diagram for NLSSOLLeastSqTraits:

13.108. NODBBASECONSTRUCTOR STRUCT REFERENCE

- bool supports_nonlinear_inequality()

  Return the flag indicating whether method supports nonlinear inequalities.

13.107.1 Detailed Description

Wrapper class for the NLSSOL nonlinear least squares library.

The NLSSOLLeastSq class provides a wrapper for NLSSOL, a Fortran 77 sequential quadratic programming library from Stanford University marketed by Stanford Business Associates. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any nonstatic attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: max_function_evaluations is implemented directly in NLSSOLLeastSq’s evaluator functions since there is no NLSSOL parameter equivalent, and max_iterations, convergence_tolerance, outputverbosity, verify_level, function_precision, and linesearch_tolerance are mapped into NLSSOL’s “Major Iteration Limit”, “Optimality Tolerance”, “Major Print Level” (verbose: Major Print Level = 20; quiet: Major Print Level = 10), ”Verify Level”, ”Function Precision”, and ”Linesearch Tolerance” parameters, respectively, using NLSSOL’s npoptn() subroutine (as wrapped by npoptn2() from the npoptn_wrapper.f file). Refer to [Gill, P.E., Murray, W., Saunders, M.A., and Wright, M.H., 1986] for information on NLSSOL’s optional input parameters and the npoptn() subroutine. A version of TraitsBase specialized for NLSSOL nonlinear least squares library

The documentation for this class was generated from the following file:

- NLSSOLLeastSq.hpp

13.108 NoDBBaseConstructor Struct Reference

Dummy struct for overloading constructors used in on-the-fly instantiations without ProblemDescDB support.

Public Member Functions

- NoDBBaseConstructor (int=0)

  C++ structs can have constructors.

13.108.1 Detailed Description

Dummy struct for overloading constructors used in on-the-fly instantiations without ProblemDescDB support.

NoDBBaseConstructor is used to overload the constructor used for on-the-fly instantiations in which ProblemDescDB queries cannot be used. Putting this struct here avoids circular dependencies.

The documentation for this struct was generated from the following file:

- dakota.global_defs.hpp

13.109 NomadTraits Class Reference

Wrapper class for NOMAD Optimizer.

Inheritance diagram for NomadTraits:
Public Member Functions

  *Return the format used for nonlinear inequality constraints.*

### 13.109.1 Detailed Description

Wrapper class for NOMAD Optimizer.

NOMAD (is a Nonlinear Optimization by Mesh Adaptive Direct search) is a simulation-based optimization package designed to efficiently explore a design space using Mesh Adaptive Search.

Mesh Adaptive Direct Search uses Meshes, discretizations of the domain space of variables. It generates multiple meshes, and as its name implies, it also adapts the refinement of the meshes in order to find the best solution of a problem.

The objective of each iteration is to find points in a mesh that improves the current solution. If a better solution is not found, the next iteration is done over a finer mesh.

Each iteration is composed of two steps: Search and Poll. The Search step finds any point in the mesh in an attempt to find an improvement; while the Poll step generates trial mesh points surrounding the current best current solution.

The NomadOptimizer is a wrapper for the NOMAD library. It features the following attributes: `max_function_evaluations`, `display_format`, `display_all_evaluations`, `function_precision`, `max_iterations`. A version of TraitsBase specialized for Nomad.

The documentation for this class was generated from the following file:

- **NomadOptimizer.hpp**
13.110 NonD Class Reference

Base class for all nondeterministic iterators (the DAKOTA/UQ branch).

Inheritance diagram for NonD:

```
  Iterator
    Analyzer
      NonD
        NonDCalibration
        NonDExpansion
        NonDIntegration
        NonDInterval
        NonDPOFDarts
        NonDReliability
        NonDRKDDarts
        NonDSampling
```

Public Member Functions

- void initialize_random_variables (short u_space_type)
  
  *initialize natafTransform based on distribution data from iteratedModel*

- void initialize_random_variables (const Pecos::ProbabilityTransformation &transform, bool deep_copy=false)
  
  *alternate form: initialize natafTransform based on incoming data*

- void initialize_random_variable_transformation ()
  
  *instantiate natafTransform*

- void initialize_random_variable_types ()
  
  *initializes ranVarTypesX within natafTransform (u-space not needed)*

- void initialize_random_variable_types (short u_space_type)
  
  *initializes ranVarTypesX and ranVarTypesU within natafTransform*

- void initialize_random_variable_parameters ()
  
  *initializes ranVarMeansX, ranVarStdDevsX, ranVarLowerBndsX, ranVarUpperBndsX, and ranVarAddtlParamsX within natafTransform*
CHAPTER 13. CLASS DOCUMENTATION

- void initialize_random_variable_correlations()
  
  propagate iteratedModel correlations to natafTransform
- void verify_correlation_support (short u_space_type)
  
  verify that correlation warping is supported by Nataf for given variable types
- void transform_correlations()
  
  perform correlation warping for variable types supported by Nataf
- void requested_levels (const RealVectorArray &req_resp_levels, const RealVectorArray &req_prob_levels, const RealVectorArray &req_rel_levels, const RealVectorArray &req_gen_rel_levels, short resp_lev_tgt, short resp_lev_tgt_reduce, bool cdf_flag, bool pdf_output)
  
  set requestedRespLevels, requestedProbLevels, requestedRelLevels, requestedGenRelLevels, respLevelTarget, cdfFlag, and pdfOutput (used in combination with alternate ctors)
- void distribution_parameter_derivatives (bool dist_param_derivs)
  
  set distParamDerivs
- void print_level_mappings (std::ostream &s) const
  
  prints the z/p/beta/beta* mappings reflected in {requested,computed}{Resp,Prob,Rel,GenRel}Levels for default qoi_type and qoi_labels
- void print_level_mappings (std::ostream &s, String qoi_type, const StringArray &qoi_labels) const
  
  prints the z/p/beta/beta* mappings reflected in {requested,computed}{Resp,Prob,Rel,GenRel}Levels
- void print_level_mappings (std::ostream &s, const RealVector &level_maps, bool moment_offset, const String &prepend="")
  
  print level mapping statistics using optional preprend
- bool resize()
  
  reinitializes iterator based on new variable size
- bool pdf_output() const
  
  get pdfOutput
- void pdf_output (bool output)
  
  set pdfOutput
- short final_moments_type () const
  
  get finalMomentsType
- void final_moments_type (short type)
  
  set finalMomentsType
- Pecos::ProbabilityTransformation & variable_transformation ()
  
  return natafTransform

Protected Member Functions

- NonD (ProblemDescDB &problem_db, Model &model)
  
  constructor
- NonD (unsigned short method_name, Model &model)
  
  alternate constructor for sample generation and evaluation “on the fly”
- NonD (unsigned short method_name, const RealVector &lower_bnds, const RealVector &upper_bnds)
  
  alternate constructor for sample generation “on the fly”
- ~NonD()
  
  destructor
• void derived_set_communicators (ParLevIter pl_iter)
  
  derived class contributions to setting the communicators associated with this Iterator instance

• void initialize_run ()
  
  utility function to perform common operations prior to pre_run(); typically memory initialization; setting of instance pointers

• void pre_run ()
  
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

• void finalize_run ()
  
  utility function to perform common operations following post_run(); deallocation and resetting of instance pointers

• const Response & response_results () const
  
  return the final statistics from the nondeterministic iteration

• void response_results_active_set (const ActiveSet &set)
  
  set the active set within finalStatistics

• virtual void initialize_response_covariance ()
  
  initializes respCovariance

• virtual void initialize_final_statistics ()
  
  initializes finalStatistics for storing NonD final results

• virtual void update_final_statistics ()
  
  update finalStatistics::functionValues

• void pull_level_mappings (RealVector &level_maps)
  
  concatenate computed {Resp,Prob,Rel,GenRel} Levels into level_maps

• void push_level_mappings (const RealVector &level_maps)
  
  update {Resp,Prob,Rel,GenRel} Levels from level_maps

• void load_pilot_sample (const SizetArray &pilot_spec, SizetArray &delta_N_l)
  
  distribute pilot sample specification across model levels

• void load_pilot_sample (const SizetArray &pilot_spec, const Sizet3DArray &N_l, SizetArray &delta_N_l)
  
  distribute pilot sample specification across model forms or levels

• void load_pilot_sample (const SizetArray &pilot_spec, const Sizet3DArray &N_l, Sizet2DArray &delta_N_l)
  
  distribute pilot sample specification across model forms and levels

• void size ()
  
  Size local variables.

• int generate_system_seed ()
  
  create a system-generated unique seed (when a seed is unspecified)

• void resize_final_statistics_gradients ()
  
  resizes finalStatistics::functionGradients based on finalStatistics ASV

• void update_aleatory_final_statistics ()
  
  update finalStatistics::functionValues from momentStats and computed {Prob,Rel,GenRel,Resp} Levels

• void update_system_final_statistics ()
  
  update system metrics from component metrics within finalStatistics

• void update_system_final_statistics_gradients ()
  
  update finalStatistics::functionGradients
• void initialize_level_mappings ()
  size computed{Resp,Prob,Rel,GenRel}Levels
• void compute_densities (const RealRealPairArray &min_max_fns, bool prob_refinement=false, bool all_levels_computed=false)
  compute the PDF bins from the CDF/CCDF values and store in computedPDF{Abscissas,Ordinates}
• void print_densities (std::ostream &s) const
  output the PDFs reflected in computedPDF{Abscissas,Ordinates} using default qoi_type and pdf_labels
• void print_densities (std::ostream &s, String qoi_type, const StringArray &pdf_labels) const
  output the PDFs reflected in computedPDF{Abscissas,Ordinates}
• void print_system_mappings (std::ostream &s) const
  print system series/parallel mappings for response levels
• void print_multilevel_evaluation_summary (std::ostream &s, const SizetArray &N_samp)
  print summary evaluation for multilevel sampling across 1D profile
• void print_multilevel_evaluation_summary (std::ostream &s, const Sizet2DArray &N_samp)
  print summary evaluation for multilevel sampling across 2D profile
• void print_multilevel_evaluation_summary (std::ostream &s, const Sizet3DArray &N_samp)
  print summary evaluation for multilevel sampling across 3D profile
• void transform_model (Model &x_model, Model &u_model, bool truncated_bounds=false, Real bound=10.)
  recast x_model from x-space to u-space to create u_model
• void construct_lhs (Iterator &u_space_sampler, Model &u_model, unsigned short sample_type, int num_samples, int seed, const String &rng, bool vary_pattern, short sampling_vars_mode=ACTIVE)
  assign a NonDLHSSampling instance within u_space_sampler
• size_t one_sided_delta (Real current, Real target)
  compute a one-sided sample increment for multilevel methods to move current sampling level to a new target
• void archive_allocate_mappings ()
  allocate results array storage for distribution mappings
• void archive_from_resp (size_t fn_index, size_t inc_id=0)
  archive the mappings from specified response levels for specified fn
• void archive_to_resp (size_t fn_index, size_t inc_id=0)
  archive the mappings to computed response levels for specified fn and (optional) increment id.
• void archive_allocate_pdf ()
  allocate results array storage for pdf histograms
• void archive_pdf (size_t fn_index, size_t inc_id=0)
  archive a single pdf histogram for specified function

Static Protected Member Functions

• static void vars_u_to_x_mapping (const Variables &u_vars, Variables &x_vars)
  static function for RecastModels used for forward mapping of u-space variables from NonD Iterators to x-space variables for Model evaluations
• static void vars_x_to_u_mapping (const Variables &x_vars, Variables &u_vars)
  static function for RecastModels used for inverse mapping of x-space variables from data import to u-space variables for NonD Iterators
• static void set_u_to_x_mapping (const Variables &u_vars, const ActiveSet &u_set, ActiveSet &x_set)
static function for RecastModels used to map u-space ActiveSets from NonD Iterators to x-space ActiveSets for Model evaluations

- static void resp_x_to_u_mapping (const Variables &x_vars, const Variables &u_vars, const Response &x_response, Response &u_response)

static function for RecastModels used to map x-space responses from Model evaluations to u-space responses for return to NonD Iterator.

Protected Attributes

- NonD * prevNondInstance
  pointer containing previous value of nondInstance

- Pecos::ProbabilityTransformation natafTransform
  Nonlinear variable transformation that encapsulates the required data for performing transformations from X -> Z -> U and back.

- size_t numContDesVars
  number of continuous design variables (modeled using uniform distribution for All view modes)

- size_t numDiscIntDesVars
  number of discrete integer design variables (modeled using discrete histogram distributions for All view modes)

- size_t numDiscStringDesVars
  number of discrete string design variables (modeled using discrete histogram distributions for All view modes)

- size_t numDiscRealDesVars
  number of discrete real design variables (modeled using discrete histogram distributions for All view modes)

- size_t numDesignVars
  total number of design variables

- size_t numContStateVars
  number of continuous state variables (modeled using uniform distribution for All view modes)

  - size_t numEpistemicUncVars
- total number of uncertain variables (native space)
  - size_t numUncertainVars
- bool epistemicStats
  - flag for computing interval-type metrics instead of integrated metrics If any epistemic variables are active in a metric evaluation, then this flag is set.
- RealMatrix momentStats
  - standardized or central moments of response functions, as determined by finalMomentsType. Calculated in compute_moments()) and indexed as (moment,fn).
- RealVectorArray requestedRespLevels
  - requested response levels for all response functions
- RealVectorArray computedProbLevels
  - output probability levels for all response functions resulting from requestedRespLevels
- RealVectorArray computedRelLevels
  - output reliability levels for all response functions resulting from requestedRespLevels
- RealVectorArray computedGenRelLevels
  - output generalized reliability levels for all response functions resulting from requestedRespLevels
- short respLevelTarget
  - indicates mapping of z->p (PROBABILITIES), z->beta (RELIABILITIES), or z->beta* (GEN_RELIABILITIES)
- short respLevelTargetReduce
  - indicates component or system series/parallel failure metrics
- RealVectorArray requestedProbLevels
  - requested probability levels for all response functions
- RealVectorArray requestedRelLevels
  - requested reliability levels for all response functions
- RealVectorArray requestedGenRelLevels
  - requested generalized reliability levels for all response functions
RealVectorArray computedRespLevels
output response levels for all response functions resulting from requestedProbLevels, requestedRelLevels, or requestedGenRelLevels

size_t totalLevelRequests
total number of levels specified within requestedRespLevels, requestedProbLevels, and requestedRelLevels

bool cdfFlag
flag for type of probabilities/reliabilities used in mappings: cumulative/CDF (true) or complementary/CCDF (false)

bool pdfOutput
flag for managing output of response probability density functions (PDFs)

RealVectorArray computedPDFAbcissas
sorted response PDF intervals bounds extracted from min/max sample and requested/computedRespLevels (vector lengths = num bins + 1)

RealVectorArray computedPDFOrdinates
response PDF densities computed from bin counts divided by (unequal) bin widths (vector lengths = num bins)

Response finalStatistics
final statistics from the uncertainty propagation used in strategies: response means, standard deviations, and probabilities of failure

short finalMomentsType
type of moments logged within finalStatistics: none, central, standard

size_t miPLIndex
index for the active ParallelLevel within ParallelConfiguration::miPLIters

BitArray pdfComputed
Whether PDF was computed for function i; used to determine whether a pdf should be archived.

Static Protected Attributes

static NonD ∗ nondInstance
pointer to the active object instance used within static evaluator functions in order to avoid the need for static data

Private Member Functions

void distribute_levels (RealVectorArray &levels, bool ascending=true)
convenience function for distributing a vector of levels among multiple response functions if a short-hand specification is employed.

void level_mappings_file (size_t fn_index, const String &qoi_label) const
Write level mappings to a file for a single response.

void print_level_map (std::ostream &s, size_t fn_index, const String &qoi_label) const
Print level mapping for a single response function to ostream.

unsigned short pecos_to_dakota_variable_type (unsigned short pecos_var_type)
convert from Pecos To Dakota variable enumeration type for continuous aleatory uncertain variables used in variable transformations

bool homogeneous (const SizetArray &N, const type) const
return true if N has consistent values
13.110. NOND CLASS REFERENCE

Private Attributes

- `bool distParamDerivs`

  flags calculation of derivatives with respect to distribution parameters s within `resp_x_to_u_mapping()` using the chain rule \( \frac{df}{dx} \cdot \frac{dx}{ds} \). The default is to calculate derivatives with respect to standard random variables u using the chain rule \( \frac{df}{dx} \cdot \frac{dx}{du} \).

13.110.1 Detailed Description

Base class for all nondeterministic iterators (the DAKOTA/UQ branch).

The base class for nondeterministic iterators consolidates uncertain variable data and probabilistic utilities for inherited classes.

13.110.2 Member Function Documentation

`void initialize_random_variables ( short u_space_type )`

initializes natafTransform based on distribution data from iteratedModel

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

References NonD::initialize_random_variable_correlations(), NonD::initialize_random_variable_parameters(), NonD::initialize_random_variable_transformation(), NonD::initialize_random_variable_types(), and NonD::verify_correlation_support().

Referenced by NonDExpansion::construct_expansion_sampler(), NonDBayesCalibration::construct_mcmc_model(), NonDExpansion::initialize_u_space_model(), NonDAAdaptImpSampling::NonDAAdaptImpSampling(), NonDGlobalReliability::NonDGlobalReliability(), NonDLocalReliability::NonDLocalReliability(), and NonDLHS-Sampling::pre_run().

`void initialize_random_variables ( const Pecos::ProbabilityTransformation & transform, bool deep_copy = false )`

alternate form: initialize natafTransform based on incoming data

This function is commonly used to publish transformation data when the Model variables are in a transformed space (e.g., u-space) and ProbabilityTransformation::ranVarTypes et al. may not be generated directly. This allows for the use of inverse transformations to return the transformed space variables to their original states.

References NonD::initialize_random_variable_transformation(), NonD::natafTransform, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContIntervalVars, and NonD::numContStateVars.

`void initialize_random_variable_types ( )`

initializes ranVarTypesX within natafTransform (u-space not needed)

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

References Model::aleatory_distribution_parameters(), Model::cv(), Iterator::iteratedModel, NonD::natafTransform, NonD::numBetaVars, NonD::numBinomialVars, NonD::numContDesVars, NonD::numContIntervalVars, NonD::numContStateVars, NonD::numExponentialVars, NonD::numFrechetVars, NonD::numGammaVars, NonD::numGeometricVars, NonD::numGumbelVars, NonD::numHistogramBinVars, NonD::numHyperGeomVars, NonD::numLognormalVars, NonD::numLoguniformVars, NonD::numNegBinomialVars, NonD::numNormalVars, NonD::numPoissonVars, NonD::numTriangularVars, NonD::numUniformVars, and NonD::numWeibullVars.
CHAPTER 13. CLASS DOCUMENTATION

Referenced by NonDExpansion::initialize_random(), NonD::initialize_random_variables(), NonDBayesCalibration::NonDBayesCalibration(), NonDIntegration::NonDIntegration(), NonDReliability::NonDReliability(), NonDLHSampling::pre_run(), and NonDReliability::resize().

```cpp
void initialize_random_variable_types ( short u_space_type )
```

initializes ranVarTypesX and ranVarTypesU within natafTransform

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

References Dakota::abort_handler(), Model::aleatory_distribution_parameters(), Model::cv(), Model::div(), Model::drv(), Model::dsv(), Iterator::iteratedModel, NonD::natafTransform, NonD::numBetaVars, NonD::numBinomialVars, NonD::numContDesVars, NonD::numContIntervalVars, NonD::numContStateVars, NonD::numExponentialVars, NonD::numFrechetVars, NonD::numGammaVars, NonD::numGeometricVars, NonD::numGumbelVars, NonD::numHistogramBinVars, NonD::numHistogramPtIntVars, NonD::numHistogramPtRealVars, NonD::numHistogramPtStringVars, NonD::numHyperGeomVars, NonD::numLognormalVars, NonD::numLoguniformVars, NonD::numNegBinomialVars, NonD::numNormalVars, NonD::numPoissonVars, NonD::numTriangularVars, NonD::numUniformVars, and NonD::numWeibullVars.

```cpp
void initialize_random_variable_parameters ( )
```

initializes ranVarMeansX, ranVarStdDevX, ranVarLowerBndsX, ranVarUpperBndsX, and ranVarAddtlParamsX within natafTransform

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

References Model::aleatory_distribution_parameters(), Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::epistemic_distribution_parameters(), Iterator::iteratedModel, NonD::natafTransform, NonD::numAleatoryUncVars, NonD::numContDesVars, Analyzer::numContinuousVars, NonD::numContStateVars, and NonD::numEpistemicUncVars.

Referenced by NonDGlobalReliability::core_run(), NonDLocalReliability::core_run(), NonDExpansion::initialize_expansion(), NonDBayesCalibration::initialize_model(), NonD::initialize_random_variables(), and NonDLHSampling::pre_run().

```cpp
void print_levelMappings ( std::ostream & s, String qoi_type, const StringArray & qoi_labels ) const
```

prints the z/p/beta/beta∗ mappings reflected in {requested,computed} {Resp,Prob,Rel,GenRel} Levels

Print distribution mappings, including to file per response.

References NonD::level_mappings_file(), Analyzer::numFunctions, Iterator::outputLevel, NonD::print_densities(), NonD::print_level_map(), NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, and Dakota::write_precision.

```cpp
void initialize_run ( ) [inline], [protected], [virtual]
```

utility function to perform common operations prior to pre_run(); typically memory initialization; setting of instance pointers

Perform initialization phases of run sequence, like allocating memory and setting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s initialize_run(), typically before performing its own implementation steps.

Reimplemented from Analyzer.

References Analyzer::initialize_run(), NonD::nondInstance, and NonD::prevNondInstance.
void pre_run( ) [inline], [protected], [virtual]

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically *before* performing its own implementation steps.

Reimplemented from Analyzer.

Reimplemented in NonDSampling, NonDLHSSampling, NonDRKDDarts, and NonDMultilevelSampling.

References Analyzer::pre_run().

Referenced by NonDRKDDarts::pre_run(), and NonDSampling::pre_run().

void finalize_run( ) [inline], [protected], [virtual]

utility function to perform common operations following post_run(); deallocation and resetting of instance pointers

Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically *after* performing its own implementation steps.

Reimplemented from Analyzer.

References Analyzer::finalize_run(), NonD::nondInstance, and NonD::prevNondInstance.

void initialize_final_statistics( ) [protected], [virtual]

initializes finalStatistics for storing NonD final results

Default definition of virtual function (used by sampling, reliability, and stochastic expansion methods) defines the set of statistical results to include the first two moments and level mappings for each QoI.

Reimplemented in NonDInterval.

References Dakota::abort_handler(), NonD::cdfFlag, Model::cv(), ActiveSet::derivative_vector(), NonD::epistemicStats, NonD::finalMomentsType, NonD::finalStatistics, Response::function_labels(), Model::inactive_continuous_variable_ids(), Iterator::iteratedModel, Dakota::length(), Analyzer::numFunctions, NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonD::respLevelTarget, NonD::respLevelTargetReduce, and NonD::totalLevelRequests.

Referenced by NonDExpansion::NonDExpansion(), NonDIntegration::NonDIntegration(), NonDReliability::NonDReliability(), NonDSampling::NonDSampling(), NonD::requested_levels(), and NonDReliability::resize().

void compute_densities( const RealRealPairArray & min_max_fns, bool prob_refinement = false, bool all_levels_computed = false ) [protected]

compute the PDF bins from the CDF/CCDF values and store in computedPDF{Abscissas,Ordinates}

This function infers PDFs from the CDF/CCDF level mappings, in order to enable PDF computation after CDF/CCDF probability level refinement (e.g., from importance sampling).

prob_refinement alerts the routine to exclude inverse mappings from the PDF, since refinement only applies to $z$-$p$ forward mappings and mixing refined and unrefined probability mappings results in an inconsistency (potentially manifesting as negative density values).

all_levels_computed is an option used by reliability methods where computed*Levels are defined across the union of all requested levels.

References NonD::archive_allocate_pdf(), NonD::cdfFlag, NonD::computedGenRelLevels, NonD::computedPDFAbscissas, NonD::computedPDFOrdinates, NonD::computedProbLevels, NonD::computedRespLevels, Analyzer::numFunctions, NonD::pdfComputed, NonD::pdfOutput, NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, and NonD::respLevelTarget.
Referenced by NonDSampling::compute_level_mappings(), NonDExpansion::compute_numerical_statistics(), NonDAdaptImpSampling::core_run(), NonDLocalReliability::core_run(), and NonDGlobalReliability::importance_sampling().

```cpp
void vars_u_to_x_mapping ( const Variables & u_vars, Variables & x_vars ) [inline], [static], [protected]
```
static function for RecastModels used for forward mapping of u-space variables from NonD Iterators to x-space variables for Model evaluations
Map the variables from iterator space (u) to simulation space (x).
References Variables::continuous_variables(), Variables::continuous_variables_view(), NonD::natafTransform, and NonD::nondInstance.
Referenced by NonD::transform_model().

```cpp
void vars_x_to_u_mapping ( const Variables & x_vars, Variables & u_vars ) [inline], [static], [protected]
```
static function for RecastModels used for inverse mapping of x-space variables from data import to u-space variables for NonD Iterators
Map the variables from simulation space (x) to iterator space (u).
References Variables::continuous_variables(), Variables::continuous_variables_view(), NonD::natafTransform, and NonD::nondInstance.
Referenced by NonD::transform_model().

```cpp
void set_u_to_x_mapping ( const Variables & u_vars, const ActiveSet & u_set, ActiveSet & x_set ) [static], [protected]
```
static function for RecastModels used to map u-space ActiveSets from NonD Iterators to x-space ActiveSets for Model evaluations
Define the DVV for x-space derivative evaluations by augmenting the iterator requests to account for correlations.
References Dakota::NPOS, Variables::all_continuous_variable_ids(), Dakota::contains(), Variables::continuous_variable_ids(), ActiveSet::derivative_vector(), Dakota::find_index(), Variables::inactive_continuous_variable_ids(), NonD::natafTransform, and NonD::nondInstance.
Referenced by NonD::transform_model().

```cpp
void level_mappings_file ( size_t fn_index, const String & qoi_label ) const [private]
```
Write level mappings to a file for a single response.
Write distribution mappings to a file for a single response.
References NonD::print_level_map(), and Dakota::write_precision.
Referenced by NonD::print_level_mappings().

```cpp
void print_level_map ( std::ostream & s, size_t fn_index, const String & qoi_label ) const [private]
```
Print level mapping for a single response function to ostream.
Print the distribution mapping for a single response function to the passed output stream. This base class version maps from one requested level type to one computed level type; some derived class implementations (e.g., local and global reliability) output multiple computed level types.
13.111 NonDAdaptImpSampling Class Reference

  returns the final probability calculated by the importance sampling

- **const RealRealPairArray & extreme_values () const**
  
  return extremeValues

**Private Member Functions**

- **void select_rep_points** (const RealVectorArray &var_samples_u, const RealVector &fn_samples)
  
  select representative points from a set of samples

- **void converge_statistics** (bool cov_flag)
  
  iteratively generate samples and select representative points until probability and (optionally) coefficient of variation converge

- **void generate_samples** (RealVectorArray &var_samples_u)
  
  generate a set of samples based on multimodal sampling density

- **void evaluate_samples** (const RealVectorArray &var_samples_u, RealVector &fn_samples)
  
  evaluate the model at the sample points and store the responses

- **void calculate_statistics** (const RealVectorArray &var_samples_u, const RealVector &fn_samples, size_t total_samples, Real &sum_prob, Real &prob, bool compute_cov, Real &sum_var, Real &cov)
  
  calculate the probability of exceeding the failure threshold and the coefficient of variation (if requested)

- **Real distance** (const RealVector &a, const RealVector &b)
  
  compute Euclidean distance between points a and b

- **Real recentered_density** (const RealVector &sample_point)
  
  compute density between a representative point and a sample point, assuming standard normal

**Private Attributes**

- **Model uSpaceModel**
  
  importance sampling is performed in standardized probability space. This u-space model is either passed in (alternate constructor for helper AIS) or constructed using transform_model() (standard constructor for stand-alone AIS)

- **unsigned short importanceSamplingType**
13.111. NONDADAPTIMPSAMPLING CLASS REFERENCE

integration type (is, ais, mmais) provided by input specification

- **bool initLHS**
  flag to identify if initial points are generated from an LHS sample

- **bool useModelBounds**
  flag to control if the sampler should respect the model bounds

- **bool invertProb**
  flag for inversion of probability values using 1.-p

- **bool trackExtremeValues**
  flag for tracking min/max values encountered when evaluating samples

- **int refineSamples**
  size of sample batch within each refinement iteration

- **size_t respFnIndex**
  the active response function index in the model to be sampled

- **RealVector designPoint**
  design subset for which uncertain subset is being sampled

- **RealVectorArray initPointsU**
  the original set of u-space samples passed in initialize()

- **RealVectorArray repPointsU**
  the set of representative points in u-space around which to sample

- **RealVector repWeights**
  the weight associated with each representative point

- **Real probEstimate**
  the probability estimate that is iteratively refined by importance sampling

- **Real failThresh**
  the failure threshold (z-bar) for the problem.

Additional Inherited Members

13.111.1 Detailed Description

Class for the Adaptive Importance Sampling methods within DAKOTA.

The NonDAdaptImpSampling implements the multi-modal adaptive importance sampling used for reliability calculations. (eventually we will want to broaden this). Need to add more detail to this description.

13.111.2 Constructor & Destructor Documentation

NonDAdaptImpSampling ( ProblemDescDB & problem_db, Model & model )

standard constructor

This is the primary constructor. It accepts a Model reference. It will perform refinement for all response QOI and all probability levels.

References Dakota::abort_handler(), NonD::finalMomentsType, ProblemDescDB::get_iv(), NonD::initialize_random_variables(), Iterator::iteratedModel, NonDSampling::numSamples, Iterator::probDescDB, NonDAdaptImpSampling::refineSamples, NonDSampling::sampleType, NonDSampling::statsFlag, NonD::transform_model(), NonDAdaptImpSampling::useModelBounds, and NonDAdaptImpSampling::uSpaceModel.
NonDAdaptImpSampling (Model & model, unsigned short sample_type, int refine_samples, int refine_seed, const String & rng, bool vary_pattern, unsigned short is_type, bool cdf_flag, bool x_space_model, bool use_model_bounds, bool track_extreme)

alternate constructor for on-the-fly instantiations

This is an alternate constructor for instantiations on the fly using a Model but no ProblemDescDB. It will perform refinement for one response QOI and one probability level (passed in initialize()).

References NonD::cdfFlag, NonDSampling::extremeValues, NonD::finalMomentsType, Iterator::maxEvalConcurrency, Analyzer::numFunctions, NonDAdaptImpSampling::refineSamples, NonDAdaptImpSampling::trackExtremeValues, NonD::transform_model(), NonDAdaptImpSampling::useModelBounds, and NonDAdaptImpSampling::uSpaceModel.

### 13.111.3 Member Function Documentation

void initialize (const RealVectorArray & acv_points, bool x_space_data, size_t resp_index, Real initial_prob, Real failure_threshold)

initializes data needed for importance sampling: an initial set of points around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations

Initializes data using a vector array of starting points.

References NonDAdaptImpSampling::designPoint, NonDAdaptImpSampling::failThresh, NonDAdaptImpSampling::initPointsU, NonDAdaptImpSampling::invertProb, NonD::natafTransform, NonD::numContDesVars, NonD::numUncertainVars, NonDAdaptImpSampling::probEstimate, and NonDAdaptImpSampling::respFnIndex.

Referenced by NonDExpansion::compute_numerical_stat_refinements(), NonDAdaptImpSampling::core_run(), and NonDGlobalReliability::importance_sampling().

void initialize (const RealMatrix & acv_points, bool x_space_data, size_t resp_index, Real initial_prob, Real failure_threshold)

initializes data needed for importance sampling: an initial set of points around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations

Initializes data using a matrix of starting points.

References NonDAdaptImpSampling::designPoint, NonDAdaptImpSampling::failThresh, NonDAdaptImpSampling::initPointsU, NonDAdaptImpSampling::invertProb, NonD::natafTransform, NonD::numContDesVars, Analyzer::numContinuousVars, NonD::numUncertainVars, NonDAdaptImpSampling::probEstimate, and NonDAdaptImpSampling::respFnIndex.

void initialize (const RealVector & acv_point, bool x_space_data, size_t resp_index, Real initial_prob, Real failure_threshold)

initializes data needed for importance sampling: an initial point around which to sample, a failure threshold, an initial probability to refine, and flags to control transformations

Initializes data using only one starting point.

References NonDAdaptImpSampling::designPoint, NonDAdaptImpSampling::failThresh, NonDAdaptImpSampling::initPointsU, NonDAdaptImpSampling::invertProb, NonD::natafTransform, NonD::numContDesVars, NonD::numUncertainVars, NonDAdaptImpSampling::probEstimate, and NonDAdaptImpSampling::respFnIndex.

The documentation for this class was generated from the following files:

- NonDAdaptImpSampling.hpp
- NonDAdaptImpSampling.cpp
13.112 NonDAdaptiveSampling Class Reference

Class for testing various Adaptively sampling methods using geometric, statistical, and topological information of the surrogate.

Inheritance diagram for NonDAdaptiveSampling:

```

  NonDSampling
    NonD
      Analyzer
        Iterator
```

Public Member Functions

- **NonDAdaptiveSampling** (ProblemDescDB &problem_db, Model &model)
  *standard constructor*

- **∼NonDAdaptiveSampling** ()
  *alternate constructor for sample generation and evaluation “on the fly” has not been implemented*

- **bool resize ()**
  *reinitializes iterator based on new variable size*

Protected Member Functions

- **void derived_init_communicators** (ParLevIter pl_iter)
  *derived class contributions to initializing the communicators associated with this Iterator instance*

- **void derived_set_communicators** (ParLevIter pl_iter)
  *derived class contributions to setting the communicators associated with this Iterator instance*

- **void derived_free_communicators** (ParLevIter pl_iter)
  *derived class contributions to freeing the communicators associated with this Iterator instance*

- **void core_run ()**
  *core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post*

- **Real final_probability ()**

- **void print_results** (std::ostream &s, short results_state=FINAL_RESULTS)
  *print the final iterator results*
Private Member Functions

- void calc_score_alm ()
  Function to compute the ALM scores for the candidate points. ALM score is the variance computed by the surrogate at the point.

- void calc_score_delta_x ()
  Function to compute the Distance scores for the candidate points. Distance score is the shortest distance between the candidate and an existing training point.

- void calc_score_delta_y ()
  Function to compute the Gradient scores for the candidate points. Gradient score is the function value difference between a candidate’s surrogate response and its nearest evaluated true response from the training set.

- void calc_score_topo_bottleneck ()
  Function to compute the Bottleneck scores for the candidate points. Bottleneck score is computed by determining the bottleneck distance between the persistence diagrams of two approximate Morse-Smale complices. The complices used include one built from only the training data, and another built from the training data and the single candidate.

- void calc_score_topo_avg_persistence (int respFnCount)
  Function to compute the Average Change in Persistence scores for the candidate points. Avg. Persistence score is computed as the average change in persistence each point undergoes between two approximate Morse-Smale complices. The complices used include one built from only the training data, and another built from the training data and the single candidate.

- void calc_score_topo_highest_persistence (int respFnCount)
  Function to compute the Highest Persistence scores for the candidate points. Highest Persistence score is calculated as a ranking of a set of candidates by constructing an approximate Morse-Smale complex over the entire set of candidates, using their surrogate responses, and the training data, using their true responses, and ranking points based on the most topological significance as measured by their persistence values. In the case where there are no topologically significant points, the point will be chosen randomly. TODO: It may be wiser to fall back to a scheme that ranks points based on proximity to extrema, or the most significant extremum?

- void calc_score_topo_alm_hybrid (int respFnCount)
  Function to compute the Hybrid scores for the candidate points. Hybrid score is computed the same as Avg. Persistence score except that instead of computing one score, three scores are computing not only a mean surface, but a mean +/- std. dev. surfaces and then averaging the three separate scores. The hope is that you strike a balance between selecting points in topologically important areas and areas of high uncertainty.

- Real calc_score_alm (int respFnCount, RealVector &test_point)
  Same as the other function of the same name, only this allows the user to specify the location of the candidate.

- Real calc_score_delta_x (int respFnCount, RealVector &test_point)
  Same as the other function of the same name, only this allows the user to specify the location of the candidate.

- Real calc_score_delta_y (int respFnCount, RealVector &test_point)
  Same as the other function of the same name, only this allows the user to specify the location of the candidate.

- Real calc_score_topo_bottleneck (int respFnCount, RealVector &test_point)
  Same as the other function of the same name, only this allows the user to specify the location of the candidate.

- Real calc_score_topo_avg_persistence (int respFnCount, RealVector &test_point)
  Same as the other function of the same name, only this allows the user to specify the location of the candidate.

- Real calc_score_topo_alm_hybrid (int respFnCount, RealVector &test_point)
  Same as the other function of the same name, only this allows the user to specify the location of the candidate.

- Real compute_rmspe ()
  Using the validationSet, compute the RMSE over the surface.

- void compare_complices (int dim, std::ostream &output)
Using the validationSet, compute the approximate Morse-Smale complices of the true model over the validationSet as well as the surrogate model over the validationSet, and output some topological comparisons.

- void parse_options ()
  Parse misc. options specified in a user input deck.
- RealVectorArray drawNewX (int this_k, int respFnCount=0)
  Function to pick the next X value to be evaluated by the Iterated model
- void output_round_data (int round, int respFnCount=0)
  Temporary function for dumping validation data to output files to be visualized in TopoAS.
- void update_amsc (int respFnCount=0)
  Update the approximate Morse-Smale complex based on the training points and selected candidates. Uses surrogate function responses.
- void construct_fsu_sampler (Iterator &u_space_sampler, Model &u_model, int num_samples, int seed, unsigned short sample_type)
  Copy of construct_lhs only it allows for the construction of FSU sample designs. This can break the fsu_cvt, so it is not used at the moment, and these designs only affect the initial sample build not the candidate sets constructed at each round.
- void output_for_optimization (int dim)
  This function will write an input deck for a multi-start global optimization run of DAKOTA by extracting all of the local minima off the approximate Morse-Smale complex created from the validation set of the surrogate model.
- Real median (const RealVector &sorted_data)
  Compute the median of the sorted values passed in
- void pick_new_candidates ()
  Pick new candidates from Emulator.
- void score_new_candidates ()
  Score New candidates based on the chosen metrics.

Private Attributes

- Iterator gpBuild
  LHS iterator for building the initial GP.
- Iterator gpEval
  LHS iterator for sampling on the GP.
- Iterator gpFinalEval
  LHS iterator for sampling on the final GP.
- Model gpModel
  GP model of response, one approximation per response function.
- int numRounds
  The number of rounds of additions of size batchSize to add to the original set of LHS samples
- int numPtsTotal
  The total number of points
- int numEmulEval
  The number of points evaluated by the GP each iteration
- int numFinalEmulEval
  Number of points evaluated on the final GP
- int scoringMethod
the type of scoring metric to use for sampling

- **Real** finalProb
  
  the final calculated probability (p)

- **RealVectorArray** gpCvars
  
  Vector to hold the current values of the current sample inputs on the GP.

- **RealVectorArray** gpMeans
  
  Vector to hold the current values of the current mean estimates for the sample values on the GP.

- **RealVectorArray** gpVar
  
  Vector to hold the current values of the current variance estimates for the sample values on the GP.

- **RealVector** emulEvalScores
  
  Vector to hold the scored values for the current GP samples.

- **RealVector** predictionErrors
  
  Vector to hold the RMSE after each round of adaptively fitting the model.

- **RealVectorArray** validationSet
  
  Validation point set used to determine predictionErrors above.

- **RealVector** yTrue
  
  True function responses at the values corresponding to validationSet.

- **RealVector** yModel
  
  Surrogate function responses at the values corresponding to validationSet.

- **int** validationSetSize
  
  Number of points used in the validationSet.

- **int** batchSize
  
  Number of points to add each round, default = 1.

- **String** batchStrategy
  
  String describing the type of batch addition to use. Allowable values are naive, distance, topology.

- **String** outputDir
  
  Temporary string for dumping validation files used in TopoAS visualization.

- **String** scoringMetric
  
  String describing the method for scoring candidate points. Options are: alm, distance, gradient, highest_persistence, avg_persistence, bottleneck, alm_topo_hybrid. Note: alm and alm_topo_hybrid will fail when used with surrogates other than global_kriging as it is based on the variance of the surrogate. At the time of implementation, global_kriging is the only surrogate capable of yielding this information.

- **unsigned short** sampleDesign
  
  Enum describing the initial sample design. Options are: RANDOM_SAMPLING, FSU_CVT, FSU_HALTON, FSU_HAMMERSLEY.

- **String** approx_type
  
  String describing type of surrogate is used to fit the data. Options are: global_kriging, global_mars, global_neural_network, global_polynomial, global_moving_least_squares, global_radial_basis.

- **MS_Complex** *AMSC
  
  The approximate Morse-Smale complex data structure.

- **int** numKneighbors
  
  The number of approximate nearest neighbors to use in computing the AMSC.

- **bool** outputValidationData
  
  Temporary variable for toggling writing of data files to be used by TopoAS.
### Additional Inherited Members

#### 13.112.1 Detailed Description

Class for testing various Adaptively sampling methods using geometric, statistical, and topological information of the surrogate.

**NonDAdaptiveSampling** implements an adaptive sampling method based on the work presented in Adaptive Sampling with Topological Scores by Dan Maljovec, Bei Wang, Ana Kupresanin, Gardar Johannesson, Valerio Pascucci, and Peer-Timo Bremer presented in IJUQ (insert issue). The method computes scores based on the topology of the known data and the topology of the surrogate model. A number of alternate adaption strategies are offered as well.

#### 13.112.2 Constructor & Destructor Documentation

**NonDAdaptiveSampling** (`ProblemDescDB & problem_db, Model & model`)  

standard constructor  

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), Response::active_set(), NonDAdaptiveSampling::AMSC, NonDAdaptiveSampling::approx_type, Iterator::assign_rep(), Model::assign_rep(), NonDAdaptiveSampling::batchSize, NonDAdaptiveSampling::batchStrategy, NonDAdaptiveSampling::construct_fsu_sampler(), NonD::construct_lhs(), Model::current_response(), ProblemDescDB::get_bool(), ProblemDescDB::get_int(), ProblemDescDB::get_iv(), ProblemDescDB::get_sa(), ProblemDescDB::get_string(), ProblemDescDB::get_ushort(), NonDAdaptiveSampling::gpBuild, NonDAdaptiveSampling::gpEval, NonDAdaptiveSampling::gpFinalEval, NonDAdaptiveSampling::gpModel, Model::gradient_type(), Model::hessian_type(), Iterator::iteratedModel, Iterator::maxIterations, NonDAdaptiveSampling::numEmulEval, NonDAdaptiveSampling::numFinalEmulEval, NonDAdaptiveSampling::numKneighbors, NonDAdaptiveSampling::numRounds, NonDAdaptiveSampling::numSamples, NonDAdaptiveSampling::outputDir, Iterator::outputLevel, NonDAdaptiveSampling::outputValidationData, NonDAdaptiveSampling::parse_options(), Iterator::probDescDB, NonDSampling::randomSeed, ActiveSet::request_values(), NonDSampling::rngName, NonDAdaptiveSampling::sampleDesign, NonDSampling::sampleType, NonDAdaptiveSampling::scoringMetric, NonDSampling::vary_pattern(), and NonDSampling::varyPattern.

~NonDAdaptiveSampling()  

alternate constructor for sample generation and evaluation “on the fly” has not been implemented  

destructor

#### 13.112.3 Member Function Documentation

**void core_run() [protected], [virtual]**  

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post  
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.  
Reimplemented from Iterator.

References Iterator::all_responses(), Model::append_approximation(), Model::approximation_data(), NonDAdaptiveSampling::batchSize, Model::build_approximation(), NonDAdaptiveSampling::compare_complexes(), NonDAdaptiveSampling::compute_rmspe(), NonD::computedProbLevels, Model::continuous_variables(), Model::current_response(), Model::current_variables(), NonDAdaptiveSampling::drawNewX(), Model::evaluate(), Model::evaluation_id(), NonDAdaptiveSampling::gpCvars, NonDAdaptiveSampling::gpFinalEval, NonDAdaptiveSampling::gpMeans,
NonDAdaptiveSampling::gpModel, NonDAdaptiveSampling::gpVar, NonD::initialize_level_mappings(), Iterator- ::iteratedModel, Iterator::methodPCIter, NonD::mplIndex, NonDAdaptiveSampling::numEmulEval, NonDAdaptive- Sampling::numFinalEmulEval, Analyzer::numFunctions, NonDAdaptiveSampling::numPtsTotal, NonDAdaptive- Sampling::numRounds, NonDSampling::numSamples, NonDAdaptiveSampling::output_round_data(), NonDAdaptive- Sampling::pick_new_candidates(), NonDAdaptiveSampling::predictionErrors, NonD::requestedRespLevels, Iterator- ::run(), NonDAdaptiveSampling::score_new_candidates(), NonDAdaptiveSampling::scoringMetric, and NonD- AdaptiveSampling::update_amsc().

```cpp
void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
```

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Analyzer.

References NonD::print_level_mappings(), and NonDSampling::statsFlag.

The documentation for this class was generated from the following files:

- NonDAdaptiveSampling.hpp
- NonDAdaptiveSampling.cpp

### 13.113 NonDBayesCalibration Class Reference

Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data.

Inheritance diagram for NonDBayesCalibration:

```
NonDDREAMBayesCalibration
NonDQUESOBayesCalibration
NonDWASABIBayesCalibration
NonDGPMSABayesCalibration
```

#### Public Member Functions

- **NonDBayesCalibration (ProblemDescDB &problem_db, Model &model)**  
  *standard constructor*
- **~NonDBayesCalibration ()**
13.113. NONDBAYESCALIBRATION CLASS REFERENCE

**Destructor**

- template<typename VectorType >
  - Real prior_density (const VectorType &vec)
    - compute the prior PDF for a particular MCMC sample
- template<typename VectorType >
  - Real log_prior_density (const VectorType &vec)
    - compute the log prior PDF for a particular MCMC sample
- template<typename Engine >
  - void prior_sample (Engine &rng, RealVector &prior_samples)
    - draw a multivariate sample from the prior distribution

**Protected Member Functions**

- void core_run ()
  - core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
- void derived_init_communicators (ParLevLIter pl_iter)
  - derived class contributions to initializing the communicators associated with this Iterator instance
- void derived_set_communicators (ParLevLIter pl_iter)
  - derived class contributions to setting the communicators associated with this Iterator instance
- void derived_free_communicators (ParLevLIter pl_iter)
  - derived class contributions to freeing the communicators associated with this Iterator instance
- void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  - print the final iterator results
- const Model & algorithm_space_model () const
- virtual void calibrate ()=0
  - Perform Bayesian calibration (all derived classes must implement)
- void construct_mcmc_model ()
  - construct mcmcModel (no emulation, GP, PCE, or SC) that wraps inbound Model
- void init_hyper_parameters ()
  - initialize the hyper-parameter priors
- void construct_map_optimizer ()

**Static Public Member Functions**

- static void get_positive_definite_covariance_from_hessian (const RealSymMatrix &hessian, const RealMatrix &prior_chol_fact, RealSymMatrix &covariance, short output_lev)
  - Compute the proposal covariance C based on low-rank approximation to the prior-preconditioned misfit Hessian.
- static Real knn_kl_div (RealMatrix &distX_samples, RealMatrix &distY_samples, size_t dim)
- static Real knn_mutual_info (RealMatrix &Xmatrix, int dimX, int dimY , unsigned short alg)
construct the negative log posterior `RecastModel` (wraps `residualModel`) and corresponding MAP optimizer

- void `initialize_model` ()
  initialize emulator model and probability space transformations

- void `calibrate_to_hifi` ()
  calibrate the model to a high-fidelity data source, using mutual information-guided design of experiments (adaptive experimental design)

- bool `eval_hi2lo_stop` (bool stop_metric, double prev_MI, double max_MI, int num_it, int num_hifi, int max_hifi, int num_candidates)
  evaluate stopping criteria for `calibrate_to_hifi`

- void `print_hi2lo_file` (std::ostream &out_file, int num_it, int batchEvals, RealMatrix &optimal_config_matrix, const RealVector &MI_vec, int max_hifi, RealMatrix &resp_matrix, const RealVector &optimal_config, double max_MI)
  print `calibrate_to_hifi` progress to file

- void `print_hi2lo_begin` (int num_it)
  print `calibrate_to_hifi` progress

- void `print_hi2lo_status` (int num_it, int i, const RealVector &xi_i, double MI)
- void `print_hi2lo_batch_status` (int num_it, int batch_n, int batchEvals, const RealVector &optimal_config, double max_MI)
- void `print_hi2lo_selected` (int num_it, int batchEvals, RealMatrix &optimal_config_matrix, const RealVector &optimal_config, double max_MI)
- void `add_lhs_hifi_data` ()
  supplement high-fidelity data with LHS samples

- void `apply_error_vec` (const RealVector &error_vec, int &seed, int experiment)
  apply simulation error vector

- void `build_error_matrix` (const RealVector &sim_error_vec, RealMatrix &sim_error_matrix, int &seed)
  build matrix of errors

- void `build_designs` (RealMatrix &design_matrix)
  build matrix of candidate points

- void `build_hi2lo_xmatrix` (RealMatrix &Xmatrix, int i, const RealMatrix &mi_chain, RealMatrix &sim_error_matrix)
  build matrix to calculate mutual information for `calibrate_to_hifi`

- void `run_hifi` (RealMatrix &optimal_config_matrix, RealMatrix &resp_matrix)
  run high-fidelity model at several configs and add to experiment data

- void `build_model_discrepancy` ()
  calculate model discrepancy with respect to experimental data

- void `build_scalar_discrepancy` ()
- void `build_field_discrepancy` ()
- void `build_GP_field` (const RealMatrix &t, RealMatrix &t_pred, const RealVector &concat_disc, RealVector &disc_pred, RealVector &disc_var)
- void `calculate_kde` ()
  calculate a Kernel Density Estimate (KDE) for the posterior samples

- void `extract_evidence` ()
  calculate the model evidence

- void `extract_selected_posterior_samples` (const std::vector< int > &points_to_keep, const RealMatrix &samples_for_posterior_eval, const RealVector &posterior_density, RealMatrix &posterior_data) const
void **export_posterior_samples_to_file** (const std::string filename, const RealMatrix &posterior_data) const

void **augment_gradient_with_log_prior** (VectorType1 &log_grad, const VectorType2 &vec)

compute the (approximate) gradient of the negative log posterior by augmenting the (approximate) gradient of the negative log likelihood with the gradient of the negative log prior

void **augment_hessian_with_log_prior** (MatrixType &log_hess, const VectorType &vec)

compute the (approximate) Hessian of the negative log posterior by augmenting the (approximate) Hessian of the negative log likelihood with the Hessian of the negative log prior

Real **log_likelihood** (const RealVector &residuals, const RealVector &hyper_params)

calculate log-likelihood from the passed residuals (assuming they are already sized and scaled by covariance / hyperparams...)

void **prior_cholesky_factorization** ()

compute prior CovCholFactor based on prior distributions for random variables and any hyperparameters

void **get_positive_definite_covariance_from_hessian** (const RealSymMatrix &hess, RealSymMatrix &covariance)

*member version forwards member data to static function*

void **scale_model** ()

Wrap iteratedModel in a RecastModel that performs response scaling.

void **weight_model** ()

Wrap iteratedModel in a RecastModel that weights the residuals.

void **export_discrepancy** (RealMatrix &pred_config_mat)

print tabular files containing model+discrepancy responses and variances

void **export_field_discrepancy** (RealMatrix &pred_vars_mat)

print tabular files containing model+discrepancy responses and variances for field responses

void **compute_statistics** ()

Compute final stats for MCMC chains.

void **export_chain** ()

export the acceptance chain in user space

void **export_chain** (RealMatrix &filtered_chain, RealMatrix &filtered_fn_vals)

Print filtered posterior and function values (later: credibility and prediction intervals)

void **filter_chain** (const RealMatrix &acceptance_chain, RealMatrix &filtered_chain, int target_length)

Perform chain filtering based on target chain length.

void **filter_chain** (const RealMatrix &acceptance_chain, RealMatrix &filtered_chain)

Perform chain filtering with burn-in and sub-sampling.

void **filter_fnvals** (const RealMatrix &accepted_fn_vals, RealMatrix &filtered_fn_vals)

void **filter_matrix_cols** (const RealMatrix &orig_matrix, int start_index, int stride, RealMatrix &filtered_matrix)

return a newly allocated filtered matrix including start_index and every stride-th index after; for burn-in cases, start_index is the number of burn-in discards

void **compute_intervals** ()

void **compute_prediction_vals** (RealMatrix &filtered_fn_vals, RealMatrix &PredVals, int num_filtered, size_t num_exp, size_t num_concatenated)
• void print_intervals_file (std::ostream &stream, RealMatrix &functionvalsT, RealMatrix &predvalsT, int length, size_t aug_length)
• void print_intervals_screen (std::ostream &stream, RealMatrix &functionvalsT, RealMatrix &predvalsT, int length)
• void kl_post_prior (RealMatrix &acceptanceChain)
  Compute information metrics.
• void prior_sample_matrix (RealMatrix &prior_dist_samples)
• void mutual_info_buildX ()
• void print_kl (std::ostream &stream)
• void print_chain_diagnostics (std::ostream &s)
• void print_batch_means_intervals (std::ostream &s)

Static Protected Member Functions
• static void neg_log_post_resp_mapping (const Variables &model_vars, const Variables &nlpost_vars, const Response &model_resp, Response &nlpost_resp)
  static function passed by pointer to negLogPostModel recast model
• static void ann_dist (const ANNpointArray matrix1, const ANNpointArray matrix2, RealVector &distances, int NX, int NY, int dim2, IntVector &k, double eps)
• static void ann_dist (const ANNpointArray matrix1, const ANNpointArray matrix2, RealVector &distances, Int2DArray &indices, int NX, int NY, int dim2, IntVector &k, double eps)

Protected Attributes
• String scalarDataFilename
• short emulatorType
  the emulator type: NO_EMULATOR, GP_EMULATOR, PCE_EMULATOR, SC_EMULATOR, ML_PCE_EMULATOR, or MF_PCE_EMULATOR
• Model mcmcModel
  Model instance employed in the likelihood function; provides response function values from Gaussian processes, stochastic expansions (PCE/SC), or direct access to simulations (no surrogate option)
• bool mcmcModelHasSurrogate
  whether the MCMC Model is a surrogate, or a thin transformation around a surrogate, so can be cheaply re-evaluated in chain recovery
• Model residualModel
  DataTransformModel wrapping the mcmcModel.
• Iterator mapOptimizer
  SQP or NIP optimizer for pre-solving for the MAP point prior to MCMC. This is restricted to emulator cases for now, but as for derivative preconditioning, could be activated for no-emulator cases with a specification option (not active by default).
• Model negLogPostModel
  RecastModel for solving for MAP: reduces residualModel to scalar negative log posterior.
• unsigned short mapOptAlgOverride
  user setting of the MAP optimization algorithm type
• Iterator stochExpIterator
  NonDPolynomialChaos or NonDStochCollocation instance for defining a PCE/SC-based mcmcModel.
- `int chainSamples`
  
  number of samples in the chain (e.g. number of MCMC samples); for iterative update cycles, number of samples per update cycle

- `int randomSeed`
  
  random seed for MCMC process

- `short mcmcDerivOrder`
  
  order of derivatives used in MCMC process (bitwise like ASV)

- `bool adaptExpDesign`
  
  whether to perform iterative design of experiments with high-fidelity model

- `size_t numCandidates`
  
  number of candidate designs for adaptive Bayesian experimental design

- `String importCandPtsFile`
  
  whether to import candidate design points for adaptive Bayesian experimental design

- `unsigned short importCandFormat`
  
  tabular format for the candidate design points import file

- `int maxHifiEvals`
  
  maximum number of high-fidelity model runs to be used for adaptive Bayesian experimental design

- `int batchEvals`
  
  number of optimal designs selected per iteration of experimental design algorithm

- `unsigned short mutualInfoAlg`
  
  algorithm to employ in calculating mutual information

- `bool readFieldCoords`
  
  need field coordinates for model discrepancy

- `bool calModelDiscrepancy`
  
  flag whether to calculate model discrepancy

- `String discrepancyType`
  
  set discrepancy type

- `String exportCorrModelFile`
  
  filename for corrected model (model+discrepancy) calculations output

- `String exportDiscrepFile`
  
  filename for discrepancy calculations output

- `String exportCorrVarFile`
  
  filename for corrected model variance calculations

- `unsigned short exportCorrModelFormat`
  
  format options for corrected model output

- `unsigned short exportDiscrepFormat`
  
  format options for discrepancy output

- `unsigned short exportCorrVarFormat`
  
  format options for corrected model variance output

- `short approxCorrectionOrder`
  
  specify polynomial or trend order for discrepancy correction

- `size_t numPredConfigs`
  
  number of prediction configurations at which to calculate model discrepancy
• RealVector \texttt{configLowerBnds}
  \textit{lower bounds on configuration domain}
• RealVector \texttt{configUpperBnds}
  \textit{upper bounds on configuration domain}
• ResponseArray \texttt{discrepancyResponses}
  \textit{array containing predicted of model+discrepancy}
• ResponseArray \texttt{correctedResponses}
  \textit{array containing predicted of model+discrepancy}
• RealMatrix \texttt{correctedVariances}
  \textit{matrix containing variances of model+discrepancy}
• RealVector \texttt{predictionConfigList}
  \textit{list of prediction configurations at which to calculate model discrepancy}
• String \texttt{importPredConfigs}
  \textit{whether to import prediction configurations at which to calculate model discrepancy}
• unsigned short \texttt{importPredConfigFormat}
  \textit{tabular format for prediction configurations import file}
• RealVector \texttt{discrepancyFieldResponses}
  \textit{array containing predicted of model+discrepancy}
• RealVector \texttt{correctedFieldResponses}
  \textit{array containing predicted of model+discrepancy}
• RealVector \texttt{correctedFieldVariances}
  \textit{matrix containing variances of model+discrepancy}
• Model \texttt{hifiModel}
  \textit{a high-fidelity model data source (given by pointer in input)}
• int \texttt{initHifiSamples}
  \textit{initial high-fidelity model samples}
• Iterator \texttt{hifiSampler}
  \textit{LHS iterator to generate hi-fi model data.}
• RealMatrix \texttt{priorCovCholFactor}
  \textit{the Cholesky factor of the prior covariance}
• unsigned short \texttt{obsErrorMultiplierMode}
  \textit{mode for number of observation error multipliers to calibrate (default none)}
• int \texttt{numHyperparams}
  \textit{calculated number of hyperparameters augmenting the calibration parameter set, e.g., due to calibrate observation error multipliers}
• RealVector \texttt{invGammaAlphas}
  \textit{alphas for inverse gamma distribution on hyper-params}
• RealVector \texttt{invGammaBetas}
  \textit{alphas for inverse gamma distribution on hyper-params}
• std::vector < Pecos::RandomVariable > \texttt{invGammaDists}
  \textit{distributions for hyper-params}
• bool \texttt{standardizedSpace}
flag indicating use of a variable transformation to standardized probability space for the model or emulator

- **bool posteriorStatsKL**
  flag indicating the calculation of KL divergence between prior and posterior

- **bool posteriorStatsMutual**
  flag indicating the calculation of mutual information between prior and posterior

- **bool posteriorStatsKDE**
  flag indicating the calculation of the kernel density estimate of the posteriors

- **bool chainDiagnostics**
  flag indicating calculation of chain diagnostics

- **bool chainDiagnosticsCI**
  flag indicating calculation of confidence intervals as a chain diagnostic

- **bool calModelEvidence**
  flag indicating calculation of the evidence of the model

- **bool calModelEvidMC**
  flag indicating use of Monte Carlo approximation to calculate evidence

- **bool calModelEvidLaplace**
  flag indicating use of Laplace approximation to calculate evidence

- **int evidenceSamples**
  number of samples to be used in model evidence calculation

- **bool adaptPosteriorRefine**
  flag indicating usage of adaptive posterior refinement; currently makes sense for unstructured grids in GP and PCE

- **String proposalCovarType**
  approach for defining proposal covariance

- **RealVector proposalCovarData**
  data from user input of proposal covariance

- **String proposalCovarFilename**
  filename for user-specified proposal covariance

- **String proposalCovarInputType**
  approach for defining proposal covariance

- **RealMatrix acceptanceChain**
  Post-processing-related controls.

- **RealMatrix acceptedFnVals**
  cached function values corresponding to acceptanceChain for final statistics reporting

- **std::map< Real, RealVector > bestSamples**
  container for managing best MCMC samples (points and associated log posterior) collected across multiple (restarted) chains

- **int burnInSamples**
  number of MCMC samples to discard from acceptance chain

- **int subSamplingPeriod**
  period or skip in post-processing the acceptance chain

- **RealMatrix chainStats**
  **RealMatrix fnStats**
  **RealMatrix predVals**
CHAPTER 13. CLASS DOCUMENTATION

Compute credibility and prediction intervals of final chain.

- **RealMatrix filteredFnVals**
  cached filtered function values for printing (may be a view of acceptedFnVals)

- **String exportMCMCFilename**
  output filename for the MCMC chain

- **short exportMCMCFormat**
  output formatting options for MCMC export

- **short filteredMCMCFormat**

- **Real kl_est**

- **bool scaleFlag**
  whether response scaling is active

- **bool weightFlag**
  whether weight scaling is active

Static Protected Attributes

- **static NonDBayesCalibration * nonBayesInstance**
  Pointer to current class instance for use in static callback functions.

13.113.1 Detailed Description

Base class for Bayesian inference: generates posterior distribution on model parameters given experimental data. This class will eventually provide a general-purpose framework for Bayesian inference. In the short term, it only collects shared code between QUESO and GPMSA implementations.

13.113.2 Constructor & Destructor Documentation

**NonDBayesCalibration ( ProblemDescDB & problem_db, Model & model )**

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), NonDBayesCalibration::adaptExpDesign, Iterator::assign_rep(), Model::assign_rep(), NonDBayesCalibration::burnInSamples, NonDCalibration::calibrationData, NonDBayesCalibration::chainSamples, NonDBayesCalibration::construct_map_optimizer(), NonDBayesCalibration::construct_mcmc_model(), Model::continuous_lower_bound(), Model::continuous_upper_bound(), NonDBayesCalibration::emulatorType, NonDCalibration::expData, NonD::generate_system_seed(), ProblemDescDB::get_bool(), NonDBayesCalibration::hifiModel, NonDBayesCalibration::hifiSampler, NonDBayesCalibration::init_hyper_parameters(), NonDBayesCalibration::initHifiSamples, NonD::initialize_random_variable_correlations(), NonD::initialize_random_variable_transformation(), NonD::initialize_random_variable_types(), Iterator::iteratedModel, Iterator::maxEvalConcurrency, NonDBayesCalibration::mcmcDerivOrder, NonDBayesCalibration::mcmcModel, Model::model_type(), ExperimentData::num_experiments(), Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, NonDBayesCalibration::obsErrorMultiplierMode, Iterator::probDescDB, NonDBayesCalibration::randomSeed, NonDBayesCalibration::residualModel, NonDBayesCalibration::scale_model(), NonDBayesCalibration::scaleFlag, NonDBayesCalibration::standardizedSpace, NonDBayesCalibration::subSamplingPeriod, Model::truth_model(), Analyzer::vary_pattern(), NonD::verify_correlation_support(), NonDBayesCalibration::weight_model(), and NonDBayesCalibration::weightFlag.
13.113. Member Function Documentation

void prior_mean ( VectorType & mean_vec ) const

return the mean of the prior distribution

Assume the target mean_vec is sized by client

References NonDBayesCalibration::invGammaDists, NonD::natafTransform, Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, and NonDBayesCalibration::standardizedSpace.

void prior_variance ( MatrixType & var_mat ) const

return the covariance of the prior distribution

Assume the target var_mat is sized by client

References NonDBayesCalibration::invGammaDists, NonD::natafTransform, Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, and NonDBayesCalibration::standardizedSpace.

void core_run ( ) [protected], [virtual]

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.

References NonDBayesCalibration::adaptExpDesign, NonDBayesCalibration::build_model_discrepancy(), NonDBayesCalibration::calibrate(), NonDBayesCalibration::calibrate_to_hifi(), NonDBayesCalibration::calModelDiscrepancy, and NonDBayesCalibration::nonDBayesInstance.

void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Analyzer.

Reimplemented in NonDGPMSABayesCalibration, NonDQUESTOBayesCalibration, and NonDWASABIBayesCalibration.

References NonDBayesCalibration::chainDiagnostics, Model::continuous_variable_labels(), Dakota::copy_data(), Model::current_response(), NonDBayesCalibration::filteredFnVals, Response::function_labels(), Dakota::length(), NonDBayesCalibration::mcmcModel, Iterator::outputLevel, NonDBayesCalibration::posteriorStatsKL, NonDSampling::print_moments(), NonD::requestedProbLevels, and NonDBayesCalibration::residualModel.

Referenced by NonDQUESTOBayesCalibration::print_results(), and NonDGPMSABayesCalibration::print_results().

const Model & algorithm_space_model( ) const [inline], [protected], [virtual]

default definition that gets redefined in selected derived Minimizers

Reimplemented from Analyzer.

References NonDBayesCalibration::mcmcModel.
void construct_map_optimizer ( ) [protected]

construct the negative log posterior RecastModel (wraps residualModel) and corresponding MAP optimizer

Construct optimizer for MAP pre-solve Emulator: on by default; can be overridden with "pre_solve none" No emulator: off by default; can be activated with "pre_solve {sqp,nip}" relies on mapOptimizer ctor to enforce min derivative support Calculation of model evidence using Laplace approximation: this requires a MAP solve.

References Iterator::assign_rep(), Model::assign_rep(), NonDBayesCalibration::calModelEvidLaplace, Iterator::convergenceTol, NonDBayesCalibration::emulatorType, Iterator::gnewton_set_recast(), NonDBayesCalibration::mapOptAlgOverride, NonDBayesCalibration::mapOptimizer, NonDBayesCalibration::mcmcDerivOrder, NonDBayesCalibration::neg_log_post_resp_mapping(), NonDBayesCalibration::negLogPostModel, Model::num_primary_fns(), and NonDBayesCalibration::residualModel.

Referenced by NonDBayesCalibration::calibrate_to_hifi(), and NonDBayesCalibration::NonDBayesCalibration().

Real log_likelihood ( const RealVector & residuals, const RealVector & all_params ) [protected]
calculate log-likelihood from the passed residuals (assuming they are already sized and scaled by covariance / hyperparams... Calculate the log-likelihood, accounting for contributions from covariance and hyperparameters, as well as constant term:

\[
\log(L) = -\frac{1}{2} \cdot Nr \cdot \log(2\pi) - \frac{1}{2} \cdot \log(\det(Cov)) + \frac{1}{2} \cdot \log(Cov^{-1}) \cdot r
\]

The passed residuals must already be size-adjusted, differenced with any data, if present, and scaled by covariance^{-1/2}.

References NonDCalibration::expData, Dakota::HALF_LOG_2PI, ExperimentData::half_log_cov_determinant(), Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, and NonDBayesCalibration::obsErrorMultiplierMode.

Referenced by NonDBayesCalibration::calculate_evidence(), NonDQUESOBayesCalibration::dakotaLogLikelihood(), NonDBayesCalibration::neg_log_post_resp_mapping(), and NonDDREAMBayesCalibration::sample_likelihood().

void neg_log_post_resp_mapping ( const Variables & residual_vars, const Variables & nlpost_vars, const Response & residual_resp, Response & nlpost_resp ) [static], [protected]

static function passed by pointer to negLogPostModel recast model

Response mapping callback used within RecastModel for MAP pre-solve. Computes -log(post) = -log(like) - log(prior); where -log(like) = 1/2*Nr*\log(2*pi) + 1/2*\log(det(Cov)) + 1/2*r'(Cov^{-1}) * r

(misfit defined as 1/2 r^T (mult 2+Gamma_d) ^{-1} r) The passed residual_resp has been differentiated, interpolated, and covariance-scaled

References Response::active_set_request_vector(), NonDBayesCalibration::augment_gradient_with_log_prior(), NonDBayesCalibration::augment_hessian_with_log_prior(), ExperimentData::build_gradient_of_sum_square_residuals(), ExperimentData::build_hessian_of_sum_square_residuals(), Variables::continuous_variables(), NonDCalibration::expData, Response::function_gradient_view(), Response::function_hessian_view(), Response::function_values(), ExperimentData::half_log_cov_det_gradient(), ExperimentData::half_log_cov_det_hessian(), NonDBayesCalibration::log_likelihood(), NonDBayesCalibration::log_prior_density(), NonDBayesCalibration::nonDBayesInstance, Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, NonDBayesCalibration::obsErrorMultiplierMode, and Iterator::outputLevel.

Referenced by NonDBayesCalibration::calculate_evidence(), and NonDBayesCalibration::construct_map_optimizer().

void scale_model ( ) [protected]

Wrap iteratedModel in a RecastModel that performs response scaling.
Wrap the residualModel in a scaling transformation, such that residualModel now contains a scaling recast model.

References Model::assign_rep(), Iterator::outputLevel, and NonDBayesCalibration::residualModel.

Referenced by NonDBayesCalibration::NonDBayesCalibration().

```cpp
void weight_model() [protected]
```

Wrap iteratedModel in a RecastModel that weights the residuals.

Setup Recast for weighting model. The weighting transformation doesn’t resize, and makes no vars, active set or secondary mapping. All indices are one-to-one mapped (no change in counts).

References Dakota::abort_handler(), Model::assign_rep(), Iterator::outputLevel, Model::primary_response_fn_, weights(), and NonDBayesCalibration::residualModel.

Referenced by NonDBayesCalibration::NonDBayesCalibration().

```cpp
void export_chain( RealMatrix & filtered_chain, RealMatrix & filtered_fn_vals ) [protected]
```

Print filtered posterior and function values (later: credibility and prediction intervals)

Print tabular file with filtered chain, function values, and pred values

References Variables::continuous_variables(), Variables::copy(), Model::current_response(), Model::current_variables(), NonDBayesCalibration::exportMCMCFilename, NonDBayesCalibration::exportMCMCFormat, Response::function_labels(), Model::interface_id(), NonDBayesCalibration::mcmcModel, Analyzer::numFunctions, NonDBayesCalibration::residualModel, Dakota::write_precision, and Variables::write_tabular().

### 13.114.4 Member Data Documentation

**RealMatrix acceptanceChain [protected]**

Post-processing-related controls.

accumulation of acceptance chain across restarts (stored in user-space) TO DO: retire once restarts are retired; optimize to convert to user-space only in final results

Private Member Functions

- void check_integration (const Pecos::ShortArray &u_types, const Pecos::AleatoryDistParams &adp)
  
  verify self-consistency of integration specification

Private Attributes

- Pecos::CubatureDriver * cubDriver
  
  convenience pointer to the numIntDriver representation

- unsigned short cubIntOrderRef
  
  reference point for Pecos::CubatureDriver::cubIntOrder: the original user specification for the number of Gauss points per dimension, plus any refinements posted by increment_grid()

- unsigned short cubIntRule
  
  the isotropic cubature integration rule

Additional Inherited Members

13.115.1 Detailed Description

Derived nondeterministic class that generates N-dimensional numerical cubature points for evaluation of expectation integrals.

This class is used by NonDPolynomialChaos, but could also be used for general numerical integration of moments. It employs Stroud cubature rules and extensions by D. Xiu.

13.115.2 Constructor & Destructor Documentation

NonDCubature ( Model & model, const Pecos::ShortArray & u_types, unsigned short cub_int_order )

This alternate constructor is used for on-the-fly generation and evaluation of numerical cubature points.

References Model::aleatory_distribution_parameters(), NonDCubature::check_integration(), NonDCubature::cubDriver, NonDCubature::cubIntOrderRef, Iterator::iteratedModel, and NonDIntegration::numIntDriver.

NonDCubature ( ProblemDescDB & problem_db, Model & model ) [protected]

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification. It is not currently used, as there is not yet a separate nond_cubature method specification.

References Model::aleatory_distribution_parameters(), NonDCubature::check_integration(), NonDIntegration::check_variables(), NonDCubature::cubDriver, NonDCubature::cubIntOrderRef, NonDCubature::cubIntRule, Iterator::iteratedModel, Iterator::maxEvalConcurrency, NonD::natafTransform, and NonDIntegration::numIntDriver.

13.115.3 Member Function Documentation

void sampling_reset ( int min_samples, bool all_data_flag, bool stats_flag ) [protected], [virtual]

used by DataFitSurrModel::build_global() to publish the minimum number of points needed from the cubature routine in order to build a particular global approximation.

Reimplemented from Iterator.

References NonDCubature::cubDriver.
void increment_grid_preference ( const RealVector & dim_pref ) [inline], [protected], [virtual]

Should not be used, but one of virtual function pair must be defined.
    Reimplemented from NonDIntegration.
    References NonDCubature::increment_grid().

void increment_grid_preference ( ) [inline], [protected], [virtual]

Should not be used, but one of virtual function pair must be defined.
    Reimplemented from NonDIntegration.
    References NonDCubature::increment_grid().

int num_samples ( ) const [inline], [protected], [virtual]

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.
    Reimplemented from Analyzer.
    References NonDCubature::cubDriver.
    The documentation for this class was generated from the following files:

- NonDCubature.hpp
- NonDCubature.cpp

13.116 NonDDREAMBayesCalibration Class Reference

Bayesian inference using the DREAM approach.

Inheritance diagram for NonDDREAMBayesCalibration:

Public Member Functions

- NonDDREAMBayesCalibration (ProblemDescDB &problem_db, Model &model)

  standard constructor
• ~ NonDDREAMBayesCalibration ()

  destructor

Static Public Member Functions

• static void problem_size (int &chain_num, int &cr_num, int &gen_num, int &pair_num, int &par_num)
  initializer for problem size characteristics in DREAM

• static void problem_value (std::string *chain_filename, std::string *gr_filename, double &gr_threshold, int &jumpstep, double limits[], int par_num, int &printstep, std::string *restart_read_filename, std::string *restart_write_filename)
  Filename and data initializer for DREAM.

• static double prior_density (int par_num, double zp[])
  Compute the prior density at specified point zp.

• static double * prior_sample (int par_num)
  Sample the prior and return an array of parameter values.

• static double sample_likelihood (int par_num, double zp[])
  Likelihood function for call-back from DREAM to DAKOTA for evaluation.

Protected Member Functions

• void calibrate ()
• void archive_acceptance_chain ()
  save the final x-space acceptance chain and corresponding function values

Static Protected Member Functions

• static void cache_chain (const double *const z)
  Callback to archive the chain from DREAM, potentially leaving it in u-space.

Protected Attributes

• RealVector paramMins
  lower bounds on calibrated parameters

• RealVector paramMaxs
  upper bounds on calibrated parameters

• int numChains
  number of concurrent chains

• int numGenerations
  number of generations

• int numCR
  number of CR-factors

• int crossoverChainPairs
  number of crossover chain pairs

• Real grThreshold
  threshold for the Gelmin-Rubin statistic
• int jumpStep  
  *how often to perform a long jump in generations*
• boost::mt19937 numGenerator  
  *random number engine for sampling the prior*

**Static Private Attributes**

• static NonDDREAMBayesCalibration * nonDDREAMInstance  
  *Pointer to current class instance for use in static callback functions.*

**Additional Inherited Members**

**13.116.1 Detailed Description**

Bayesian inference using the DREAM approach.

This class performed Bayesian calibration using the DREAM (Markov Chain Monte Carlo acceleration by Differential Evolution) implementation of John Burkhardt (FSU), adapted from that of Guannan Zhang (ORNL).

**13.116.2 Constructor & Destructor Documentation**

NonDDREAMBayesCalibration (ProblemDescDB & problem_db, Model & model)

*standard constructor*

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References NonDBayesCalibration::chainSamples, NonDDREAMBayesCalibration::crossoverChainPairs, NonDDREAMBayesCalibration::grThreshold, NonDDREAMBayesCalibration::jumpStep, NonDDREAMBayesCalibration::numChains, NonDDREAMBayesCalibration::numCR, and NonDDREAMBayesCalibration::numGenerations.

**13.116.3 Member Function Documentation**

void problem_size ( int & chain_num, int & cr_num, int & gen_num, int & pair_num, int & par_num )  
* [static]*

*initializer for problem size characteristics in DREAM*

See documentation in DREAM examples.

References NonDDREAMBayesCalibration::crossoverChainPairs, NonDDREAMBayesCalibration::nonDDREAMInstance, NonDDREAMBayesCalibration::numChains, Analyzer::numContinuousVars, NonDDREAMBayesCalibration::numCR, NonDDREAMBayesCalibration::numGenerations, and NonDBayesCalibration::numHyperparams.

void problem_value ( std::string * chain_filename, std::string * gr_filename, double & gr_threshold, int & jumpstep, double limits[], int par_num, int & printstep, std::string * restart_read_filename, std::string * restart_write_filename )  
* [static]*

*Filename and data initializer for DREAM.*

See documentation in DREAM examples.

References NonDDREAMBayesCalibration::grThreshold, NonDDREAMBayesCalibration::jumpStep, NonDDREAMBayesCalibration::nonDDREAMInstance, NonDDREAMBayesCalibration::numChains, NonDDREAMBayesCalibration::paramMaxs, and NonDDREAMBayesCalibration::paramMins.
double prior_density ( int par_num, double *zp[ ] ) [static]

Compute the prior density at specified point zp.
See documentation in DREAM examples
References NonDBayesCalibration::nonDBayesInstance, and NonBayesCalibration::prior_density().

double * prior_sample ( int par_num ) [static]

Sample the prior and return an array of parameter values.
See documentation in DREAM examples
References NonDBayesCalibration::nonDBayesInstance, NonDDREAMBayesCalibration::nonDDREAMInstance, and NonDDREAMBayesCalibration::rnumGenerator.

double sample_likelihood ( int par_num, double *zp[ ] ) [static]

Likelihood function for call-back from DREAM to DAKOTA for evaluation.
Static callback function to evaluate the likelihood
References Model::continuous_variables(), Model::current_response(), Model::evaluate(), Response::function_values(), NonDBayesCalibration::log_likelihood(), NonDDREAMBayesCalibration::nonDDREAMInstance, Iterator::outputLevel, and NonBayesCalibration::residualModel.

void calibrate ( ) [protected], [virtual]

Perform the uncertainty quantification DREAM will callback to cache_chain to store the chain
Implements NonDBayesCalibration.
References Dakota::abort_handler(), NonDDREAMBayesCalibration::archive_acceptance_chain, NonDDREAMBayesCalibration::cache_chain, NonDCalibration::calibrationData, NonBayesCalibration::chainSamples, NonDBayesCalibration::compute_statistics, Model::continuous_variables, NonDBayesCalibration::initialize_model, NonDBayesCalibration::mcmcModel, NonD::natafTransform, NonDDREAMBayesCalibration::nonDDREAMInstance, Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, NonDBayesCalibration::obsErrorMultiplierMode, NonDDREAMBayesCalibration::paramMaxs, NonDDREAMBayesCalibration::paramMins, NonDBayesCalibration::randomSeed, NonDDREAMBayesCalibration::rnumGenerator, and NonBayesCalibration::standardizedSpace.

void cache_chain ( const double *const z ) [static], [protected]

Callback to archive the chain from DREAM, potentially leaving it in u-space.
Archive the chain from DREAM. This default implementation is aggregating from the parallel chains in a round-robin fashion.
References NonDBayesCalibration::acceptanceChain, NonDDREAMBayesCalibration::nonDDREAMInstance, Analyzer::num_samples(), NonDDREAMBayesCalibration::numChains, Analyzer::numContinuousVars, NonDDREAMBayesCalibration::numGenerations, and NonBayesCalibration::numHyperparams.
Referenced by NonDDREAMBayesCalibration::calibrate().
The documentation for this class was generated from the following files:

Public Member Functions

- `NonDExpansion (ProblemDescDB &problem_db, Model &model)`
  standard constructor
- `NonDExpansion (unsigned short method_name, Model &model, short exp_coeffs_approach, bool piecewise_basis, bool use_derivs)`
  alternate constructor
- `~NonDExpansion ()`
  destructor
- `bool resize ()`
  reinitializes iterator based on new variable size
- `void derived_init_communicators (ParLevLIter pl_iter)`
  derived class contributions to initializing the communicators associated with this Iterator instance
- `void derived_set_communicators (ParLevLIter pl_iter)`
  derived class contributions to setting the communicators associated with this Iterator instance
- `void derived_free_communicators (ParLevLIter pl_iter)`
  derived class contributions to freeing the communicators associated with this Iterator instance
- `void core_run ()`
  perform a forward uncertainty propagation using PCE/SC methods
- `void print_results (std::ostream &s, short results_state=FINAL_RESULTS)`
  print the final statistics
- `const Model & algorithm_space_model () const`
- `virtual void select_refinement_points (const RealVectorArray &candidate_samples, unsigned short batch_size, RealMatrix &best_samples)`
  evaluate allSamples for inclusion in the (PCE regression) approximation and retain the best set (well spaced) of size batch_size
• virtual void append_expansion (const RealMatrix &samples, const IntResponseMap &resp_map)
append new data to uSpaceModel and update expansion order (PCE only)

Protected Member Functions
• virtual void resolve_inputs (short &u_space_type, short &data_order)
perform error checks and mode overrides
• virtual void initialize_u_space_model ()
initialize uSpaceModel polynomial approximations with PCE/SC data
• virtual void initialize_expansion ()
initialize random variable definitions and final stats arrays
• virtual void compute_expansion ()
form the expansion by calling uSpaceModel.build_approximation()
• virtual void increment_order_and_grid ()
uniformly increment the expansion order and structured/unstructured grid (PCE only)
• virtual void decrement_order_and_grid ()
uniformly decrement the expansion order and structured/unstructured grid (PCE only)
• virtual void assign_specification_sequence ()
assign the current values from the input specification sequence
• virtual void increment_specification_sequence ()
increment the input specification sequence and assign values
• virtual void update_expansion ()
update an expansion; avoids overhead in compute_expansion()
• virtual void combined_to_active ()
combine coefficients, promote to active, and update statsType
• virtual void archive_coefficients ()
archive expansion coefficients, as supported by derived instance
• virtual void metric_roll_up ()
perform any required expansion roll-ups prior to metric computation
• virtual Real compute_covariance_metric (bool revert, bool print_metric)
compute 2-norm of change in response covariance
• virtual Real compute_level_mappings_metric (bool revert, bool print_metric)
compute 2-norm of change in final statistics
• virtual void compute_statistics (short results_state=FINAL_RESULTS)
calculate analytic and numerical statistics from the expansion, supporting {REFINEMENT,INTERMEDIATE,FINAL_RESULTS} modes
• virtual void pull_candidate (RealVector &stats_star)
extract statistics from native stats arrays for a selected candidate
• virtual void push_candidate (const RealVector &stats_star)
restore statistics into native stats arrays for a selected candidate
• void initialize_response_covariance ()
set covarianceControl defaults and shape respCovariance
• void update_final_statistics ()
update function values within finalStatistics
• void update_final_statistics_gradients ()
  update function gradients within finalStatistics
• void initialize_random (short u_space_type)
  common constructor code for initialization of natafTransform
• void check_dimension_preference (const RealVector &dim_pref) const
  check length and content of dimension preference vector
• void construct_cubature (Iterator &u_space_sampler, Model &g_u_model, unsigned short cub_int_order)
  assign a NonDcubature instance within u_space_sampler
• void construct_quadrature (Iterator &u_space_sampler, Model &g_u_model, unsigned short quad_order, const RealVector &dim_pref)
  assign a NonDQuadrature instance within u_space_sampler based on a quad_order specification
• void construct_quadrature (Iterator &u_space_sampler, Model &g_u_model, unsigned short quad_order, const RealVector &dim_pref, int filtered_samples)
  assign a NonDQuadrature instance within u_space_sampler that generates a filtered tensor product sample set
• void construct_quadrature (Iterator &u_space_sampler, Model &g_u_model, unsigned short quad_order, const RealVector &dim_pref, int random_samples, int seed)
  assign a NonDQuadrature instance within u_space_sampler that samples randomly from a tensor product multi-index
• void construct_sparse_grid (Iterator &u_space_sampler, Model &g_u_model, unsigned short ssg_level, const RealVector &dim_pref)
  assign a NonDSparseGrid instance within u_space_sampler
• void construct_expansion_sampler (const String &import_approx_file, unsigned short import_approx_format=T-ABULAR_ANNOTATED, bool import_approx_active_only=false)
  construct the expansionSampler for evaluating samples on uSpaceModel
• void multifidelity_expansion (short refine_type, bool to_active=true)
  construct a multifidelity expansion, across model forms or discretization levels
• void greedy_multifidelity_expansion ()
  construct a multifidelity expansion, across model forms or discretization levels
• void configure_levels (size_t &num_lev, unsigned short &model_form, bool &multilevel, bool mf_precedence)
  configure fidelity/level counts from model hierarchy
• void configure_cost (size_t num_lev, bool multilevel, RealVector &cost)
  configure fidelity/level counts from model hierarchy
• void configure_indices (unsigned short lev, unsigned short form, bool multilevel)
  configure response mode and truth/surrogate model indices within hierarchical iteratedModel
• Real level_cost (unsigned short lev, const RealVector &cost)
  return aggregate cost (one or more models) for a level sample
• void compute_equivalent_cost (const SizetArray &N_l, const RealVector &cost)
  compute equivHFEvals from samples per level and cost per evaluation
• void form_key (unsigned short lev, unsigned short form, bool multilevel, UShortArray &model_key)
  creat a model key from level index, form index, and multilevel flag
• void activate_key (const UShortArray &model_key)
  activate model key within uSpaceModel
• void activate_key (unsigned short lev, unsigned short form, bool multilevel)
  activate model key within uSpaceModel
• void refine_expansion ()
  
  refine the reference expansion found by compute_expansion() using uniform/adaptive p-h-refinement strategies
• void pre_refinement ()
  
  initialization of expansion refinement, if necessary
• size_t core_refinement (Real &metric, bool revert=false, bool print_metric=true)
  
  advance the refinement strategy one step
• void post_refinement (Real &metric, bool reverted=false)
  
  finalization of expansion refinement, if necessary
• void increment_grid (bool update_anisotropy=true)
  
  helper function to manage different grid increment cases
• void decrement_grid ()
  
  helper function to manage different grid decrement cases
• void merge_grid ()
  
  helper function to manage different grid merge cases
• void push_increment ()
  
  helper function to manage different push increment cases
• void pop_increment ()
  
  helper function to manage different pop increment cases
• void statistics_type (short stats_type, bool clear_bits=true)
  
  update statsType, here and in Pecos::ExpansionConfigOptions
• void compute_covariance ()
  
  calculate the response covariance (diagonal or full matrix) for the expansion indicated by statsType
• void compute_active_covariance ()
  
  calculate the response covariance of the active expansion
• void compute_combined_covariance ()
  
  calculate the response covariance of the combined expansion
• void compute_active_diagonal_variance ()
  
  calculate the diagonal response variance of the active expansion
• void compute_combined_diagonal_variance ()
  
  calculate the diagonal response variance of the combined expansion
• void compute_off_diagonal_covariance ()
  
  calculate off diagonal terms in respCovariance(i,j) for j<i for the expansion indicated by statsType
• void compute_active_off_diagonal_covariance ()
  
  calculate off diagonal terms in respCovariance(i,j) for j<i using the active expansion coefficients
• void compute_combined_off_diagonal_covariance ()
  
  calculate off diagonal terms in respCovariance(i,j) for j<i using the combined expansion coefficients
• void compute_moments ()
  
  compute expansion moments; this uses a lightweight approach for incremental statistics (no additional moments; no finalStatistics update)
• void compute_level_mappings ()
  
  compute all analytic/numerical level mappings; this uses a lightweight approach for incremental statistics (no derivatives, no finalStatistics update)
• void compute_numerical_level_mappings ()
compute only numerical level mappings; this uses a lightweight approach for incremental statistics (no derivatives, no finalStatistics update)

- void compute_sobol_indices ()
  compute Sobol’ indices for main, interaction, and total effects; this is intended for incremental statistics

- void print_covariance (std::ostream &s)
  print respVar (Variance, Covariance)

- void print_variance (std::ostream &s, const RealVector &resp_var, const String &prepend="")
  print resp_var (response variance vector) using optional pre-pend

- void print_covariance (std::ostream &s, const RealSymMatrix &resp_covar, const String &prepend="")
  print resp_covar (response covariance matrix) using optional pre-pend

- void archive_moments ()
  archive the central moments (numerical and expansion) to ResultsDB

- void archive_sobol_indices ()
  archive the Sobol’ indices to the resultsDB

- void pull_reference (RealVector &stats_ref)

- void push_reference (const RealVector &stats_ref)

- void pull_lower_triangle (const RealSymMatrix &mat, RealVector &vec, size_t offset=0)
  pull lower triangle of symmetric matrix into vector

- void push_lower_triangle (const RealVector &vec, RealSymMatrix &mat, size_t offset=0)
  push vector into lower triangle of symmetric matrix

**Protected Attributes**

- Model uSpaceModel
  Model representing the approximate response function in u-space, after u-space recasting and polynomial data fit recursions.

- short expansionCoeffsApproach
  method for collocation point generation and subsequent calculation of the expansion coefficients

- short expansionBasisType
  type of expansion basis: DEFAULT, BASIS or Pecos::[NODAL, HIERARCHICAL] INTERPOLANT for SC or Pecos::[TENSOR_PRODUCT, TOTAL_ORDER, ADAPTED] BASIS for PCE regression

- short statsType
  type of statistical metric: NO_EXPANSION_STATS, ACTIVE_EXPANSION_STATS, or COMBINED_EXPANSION_STATS

- short multilevDiscrepEmulation
  emulation approach for multilevel discrepancy: distinct or recursive

- SizetArray NLev
  number of samples allocated to each level of a discretization/model hierarchy within multilevel/multifidelity methods

- Real equivHFEvals
  equivalent number of high fidelity evaluations accumulated using samples across multiple model forms and/or discretization levels

- size_t numUncertainQuant
  number of invocations of core_run()

- int numSamplesOnModel
  number of truth samples performed on g_u_model to form the expansion
• int numSamplesOnExpansion
  number of approximation samples performed on the polynomial expansion in order to estimate probabilities

• bool relativeMetric
  flag indicating the use of relative scaling in refinement metrics

• bool nestedRules
  flag for indicating state of nested and non_nested overrides of default rule nesting, which depends on the type of integration driver; this is defined in construct_{quadrature,sparse_grid}(), such that override attributes (defined in ctors) must be used upstream

• short ruleNestingOverride
  user override of default rule nesting: NO_NESTING_OVERRIDE, NESTED, or NON_NESTED

• short ruleGrowthOverride
  user override of default rule growth: NO_GROWTH_OVERRIDE, RESTRICTED, or UNRESTRICTED

• bool piecewiseBasis
  flag for piecewise specification, indicating usage of local basis polynomials within the stochastic expansion

• bool useDerivs
  flag for use_derivatives specification, indicating usage of derivative data (with respect to expansion variables) to enhance the calculation of the stochastic expansion.

• RealVector initialPtU
  stores the initial variables data in u-space

• short refineType
  refinement type: NO_REFINEMENT, P_REFINEMENT, or H_REFINEMENT

• short refineControl
  refinement control: NO_CONTROL, UNIFORM_CONTROL, LOCAL_ADAPTIVE_CONTROL, DIMENSION_ADAPTIVE_CONTROL_SOBOL, DIMENSION_ADAPTIVE_CONTROL_DECAY, or DIMENSION_ADAPTIVE_CONTROL_GENERALIZED

• short refineMetric
  refinement metric: NO_METRIC, COVARIANCE_METRIC, LEVEL_STATS_METRIC, or MIXED_STATS_METRIC

• short covarianceControl
  enumeration for controlling response covariance calculation and output: {DEFAULT,DIAGONAL,FULL}_COVARIANCE

• unsigned short softConvLimit
  number of consecutive iterations within tolerance required to indicate soft convergence

• RealSymMatrix respCovariance
  symmetric matrix of analytic response covariance (full response covariance option)

• RealVector respVariance
  vector of response variances (diagonal response covariance option)

• RealVector levelStatsStar
  stats of the best candidate for the current level

• RealVector statsStar
  stats of the best candidate across all levels
Private Member Functions

- void aggregated_models_mode()
  set response mode to AGGREGATED_MODELS and recur response size updates
- void bypass_surrogate_mode()
  set response mode to BYPASS_SURROGATE and recur response size updates
- void reduce_total_sobol_sets(RealVector &avg_sobol)
  compute average of total Sobol' indices (from VBD) across the response set for use as an anisotropy indicator
- void reduce_decay_rate_sets(RealVector &min_decay)
  compute minimum of spectral coefficient decay rates across the response set for use as an anisotropy indicator
- size_t increment_sets(Real &delta_star, bool revert, bool print_metric)
  perform an adaptive refinement increment using generalized sparse grids
- void finalize_sets(bool converged_within_tol, bool reverted=false)
  finalization of adaptive refinement using generalized sparse grids
- void select_candidate(size_t best_candidate)
  promote selected candidate into reference grid + expansion
- void select_index_set_candidate(std::set< UShortArray >::const_iterator cit_star)
  promote selected index set candidate into reference grid + expansion
- void select_increment_candidate()
  promote selected refinement increment candidate into reference grid + expansion
- void compute_analytic_statistics()
  analytic portion of compute_statistics() from post-processing of expansion coefficients (used for FINAL_RESULTS)
- void compute_numerical_statistics()
  numerical portion of compute_statistics() from sampling on the expansion (used for FINAL_RESULTS)
- void compute_numerical_stat_refinements(RealVectorArray &imp_sampler_stats, RealRealPairArray &min_max_fns)
  refinements to numerical probability statistics from importanceSampler
- void define_sampler_asv(ShortArray &sampler_asv)
  helper to define the expansionSampler's data requests when sampling on the expansion
- void run_sampler(const ShortArray &sampler_asv, RealVector &exp_sampler_stats)
  helper to run the expansionSampler and compute its statistics
- void refine_sampler(RealVectorArray &imp_sampler_stats, RealRealPairArray &min_max_fns)
  helper to refine the results from expansionSampler with importance sampling (for probability levels) or bounds
  post-processing (for PDFs)
- void print_moments(std::ostream &s)
  print expansion and numerical moments
- void print_sobol_indices(std::ostream &s)
  print global sensitivity indices
- void print_local_sensitivity(std::ostream &s)
  print local sensitivities evaluated at initialPtU
Private Attributes

- **Iterator expansionSampler**
  
  *Iterator* used for sampling on the uSpaceModel to generate approximate probability/reliability/response level statistics. Currently this is an LHS sampling instance, but AIS could also be used.

- **Iterator importanceSampler**
  
  *Iterator* used to refine the approximate probability estimates generated by the expansionSampler using importance sampling.

- **RealMatrix expGradsMeanX**
  
  derivative of the expansion with respect to the x-space variables evaluated at the means (used as uncertainty importance metrics)

- **int maxRefineIterations**
  
  maximum number of uniform/adaptive refinement iterations (specialization of maxIterations)

- **int maxSolverIterations**
  
  maximum number of regression solver iterations (specialization of maxIterations)

- **bool vbdFlag**
  
  flag indicating the activation of variance-based decomposition for computing Sobol’ indices

- **unsigned short vbdOrderLimit**
  
  limits the order of interactions within the component Sobol’ indices

- **Real vbdDropTol**
  
  tolerance for omitting output of small VBD indices

- **unsigned short integrationRefine**
  
  integration refinement for expansion sampler

- **String expansionRng**
  
  random number generator for expansion sampler

- **int origSeed**
  
  seed for expansion sampler random number generator

- **unsigned short expansionSampleType**
  
  sample type for expansion sampler

- **IntVector refinementSamples**
  
  refinement samples for expansion sampler

13.117.1 Detailed Description

Base class for polynomial chaos expansions (PCE) and stochastic collocation (SC)

The NonDExpansion class provides a base class for methods that use polynomial expansions to approximate the effect of parameter uncertainties on response functions of interest.

13.117.2 Member Function Documentation

`const Model & algorithm_space_model() const [inline],[virtual]`

default definition that gets redefined in selected derived Minimizers

Reimplemented from Analyzer.

References NonDExpansion::uSpaceModel.
void increment_specification_sequence ( ) [protected], [virtual]
increment the input specification sequence and assign values
  Default implementation redefined by Multilevel derived classes.
  Reimplemented in NonDMultilevelPolynomialChaos, and NonDMultilevelStochCollocation.
  References Dakota::abort_handler().
  Referenced by NonDExpansion::multifidelity_expansion().

void update_expansion ( ) [protected], [virtual]
update an expansion; avoids overhead in compute_expansion()
  leave sampler_set, expansion flags, and distribution parameter settings as set previously by compute_expansion();
  there should be no need to update these for an expansion refinement.
  References Model::append_approximation(), NonDIntegration::evaluate_grid_increment(), NonDExpansion::
  expansionCoeffsApproach, NonDExpansion::increment_grid(), Iterator::iterator_rep(), Model::push_approximation(),
  Model::push_available(), NonDIntegration::push_grid_increment(), Model::rebuild_approximation(), Model::subordinate_ 
  iterator(), Model::update_approximation(), and NonDExpansion::uSpaceModel.
  Referenced by NonDExpansion::core_refinement(), and NonDMultilevelPolynomialChaos::multilevel_regression().

Real compute_covariance_metric ( bool revert, bool print_metric ) [protected], [virtual]
compute 2-norm of change in response covariance
  computes the default refinement metric based on change in respCovariance
  Reimplemented in NonDStochCollocation.
  References NonDExpansion::compute_moments(), NonDExpansion::compute_off_diagonal_covariance(), NonDExpansion::
  covarianceControl, NonDExpansion::print_covariance(), NonDExpansion::relativeMetric, NonDExpansion::
  respCovariance, and NonDExpansion::respVariance.
  Referenced by NonDStochCollocation::compute_covariance_metric(), NonDExpansion::core_refinement(), and 
  NonDExpansion::increment_sets().

Real compute_level_mappings_metric ( bool revert, bool print_metric ) [protected], [virtual]
compute 2-norm of change in final statistics
  computes a "goal-oriented" refinement metric employing computed-Levels
  Reimplemented in NonDStochCollocation.
  References NonDExpansion::compute_level_mappings(), Analyzer::numFunctions, NonD::print_level_mappings(),
  NonD::pull_level_mappings(), NonD::push_level_mappings(), NonDExpansion::relativeMetric, NonD::requested-
  GenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, and NonD::requestedRespLevels.
  Referenced by NonDStochCollocation::compute_level_mappings_metric(), NonDExpansion::core_refinement(), and 
  NonDExpansion::increment_sets().

void compute_statistics ( short results_state = FINAL_RESULTS ) [protected], [virtual]
calculate analytic and numerical statistics from the expansion, supporting {REFINEMENT,INTERMEDIATE,F-
  INAL}.RESULTS modes
  Calculate analytic and numerical statistics from the expansion and log results within final_stats for use in 
  OUU.
  References ResultsManager::active(), NonDExpansion::archive_coefficients(), NonDExpansion::archive_moments(),
  NonDExpansion::archive_sobol_indices(), NonDExpansion::compute_analytic_statistics(), NonDExpansion::compute-
  _level_mappings(), NonDExpansion::compute_moments(), NonDExpansion::compute_numerical_statistics(), Non-
  DExpansion::compute_off_diagonal_covariance(), Model::continuous_variable_labels(), Model::continuous_variables(),

13.117.3 Member Data Documentation

bool useDerivs [protected]

flag for use derivatives specification, indicating usage of derivative data (with respect to expansion variables) to enhance the calculation of the stochastic expansion.

This is part of the method specification since the instantiation of the global data fit surrogate is implicit with no user specification. This behavior is distinct from the usage of response derivatives with respect to auxilliary variables (design, epistemic) for computing derivatives of aleatory expansion statistics with respect to these variables.

Referenced by NonDExpansion::compute_expansion(), NonDStochCollocation::initialize_u_space_model(), NonDPolynomialChaos::initialize_u_space_model(), NonDPolynomialChaos::ratio_samples_to_order(), NonDStochCollocation::resolve_inputs(), NonDPolynomialChaos::resolve_inputs(), NonDPolynomialChaos::terms_ratio_to_samples(), and NonDPolynomialChaos::terms_samples_to_ratio().

13.118.1 Detailed Description

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

The NonDEvidence class implements the propagation of epistemic uncertainty using Dempster-Shafer theory of evidence. In this approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated, along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

The documentation for this class was generated from the following files:

- NonDGlobalEvidence.hpp
- NonDGlobalEvidence.cpp

13.119 NonDGlobalInterval Class Reference

Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

Inheritance diagram for NonDGlobalInterval:

  *derived class contributions to freeing the communicators associated with this Iterator instance*
- void **core_run** ()
  
  *Performs an optimization to determine interval bounds for an entire function or interval bounds on a particular statistical estimator.*
- const **Model** & **algorithm_space_model** () const

Protected Member Functions

- virtual void **initialize** ()
  
  *perform any required initialization*
- virtual void **set_cell_bounds** ()
  
  *set the optimization variable bounds for each cell*
- virtual void **get_best_sample** (bool maximize, bool eval_approx)
  
  *determine truthFnStar and approxFnStar*
- virtual void **post_process_cell_results** (bool maximize)
  
  *post-process a cell minimization/maximization result*
- virtual void **post_process_response_fn_results** ()
  
  *post-process the interval computed for a response function*
- virtual void **post_process_final_results** ()
perform final post-processing

- **void** `post_process_run_results` (bool maximize)
  - post-process an optimization execution: output results, update convergence controls, and update GP approximation

- **void** `evaluate_response_star_truth` ()
  - evaluate the truth response at the optimal variables solution and update the GP with the new data

### Protected Attributes

- **Iterator** `daceIterator`
  - LHS iterator for constructing initial GP for all response functions.

- **Model** `fHatModel`
  - GP model of response, one approximation per response function.

- **Iterator** `intervalOptimizer`
  - optimizer for solving surrogate-based subproblem: NCSU DIRECT optimizer for maximizing expected improvement or mixed EA if discrete variables.

- **Model** `intervalOptModel`
  - recast model which formulates the surrogate-based optimization subproblem (recasts as design problem; may assimilate mean and variance to enable max(expected improvement))

- **Real** `approxFnStar`
  - approximate response corresponding to minimum/maximum truth response

- **Real** `truthFnStar`
  - minimum/maximum truth response function value

### Static Private Member Functions

- **static void** `EIF_objective_min` (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)
  - static function used as the objective function in the Expected Improvement Function (EIF) for minimizing the GP

- **static void** `EIF_objective_max` (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)
  - static function used as the objective function in the Expected Improvement Function (EIF) for maximizing the GP

- **static void** `extract_objective` (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)
  - static function used to extract the active objective function when optimizing for an interval lower or upper bound (non(EIF) formulations). The sense of the optimization is set separately.

### Private Attributes

- **const int** `seedSpec`
  - the user seed specification (default is 0)

- **int** `numSamples`
  - the number of samples used in the surrogate

- **String** `rngName`
  - name of the random number generator

- **bool** `gpModelFlag`
CHAPTER 13. CLASS DOCUMENTATION

flag indicating use of GP surrogate emulation
• bool eifFlag
  flag indicating use of maximized expected improvement for GP iterate selection
• unsigned short improvementConvergeCntr
  counter for number of successive iterations that the iteration improvement is less than the convergenceTol
• unsigned short improvementConvergeLimit
  counter for number of successive iterations that the iteration improvement is less than the convergenceTol
• Real distanceTol
  tolerance for $L_2$ change in optimal solution
• unsigned short distanceConvergeCntr
  counter for number of successive iterations that the $L_2$ change in optimal solution is less than the convergenceTol
• unsigned short distanceConvergeLimit
  counter for number of successive iterations that the $L_2$ change in optimal solution is less than the convergenceTol
• RealVector prevCVStar
  stores previous optimal point for continuous variables; used for assessing convergence
• IntVector prevDIVStar
  stores previous optimal point for discrete integer variables; used for assessing convergence
• RealVector prevDRVStar
  stores previous optimal point for discrete real variables; used for assessing convergence
• Real prevFnStar
  stores previous solution value for assessing convergence
• size_t globalIterCntr
  global iteration counter for number of surrogate-based min/max solves
• bool boundConverged
  flag indicating convergence of a minimization or maximization cycle
• bool allResponsesPerIter
  flag for maximal response extraction (all response values obtained on each function call)
• short dataOrder
  order of the data used for surrogate construction, in ActiveSet request vector 3-bit format; user may override responses spec

Static Private Attributes
• static NonDGlobalInterval * nondGIInstance
  pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data

Additional Inherited Members

13.119.1 Detailed Description

Class for using global nongradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

The NonDGlobalInterval class supports global nongradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g., intervals on input = intervals on output), or the intervals may be on statistics of an “inner loop” aleatory analysis such as intervals on means, variances, or percentile levels. The preliminary implementation will use a Gaussian process surrogate to determine interval bounds.

13.119.2 Member Function Documentation

const Model & algorithm_space_model() const [inline], [virtual]
default definition that gets redefined in selected derived Minimizers
Reimplemented from Analyzer.
References NonDGlobalInterval::fHatModel.
The documentation for this class was generated from the following files:
- NonDGlobalInterval.hpp

- void **core_run ()**
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
- void **print_results (std::ostream &s, short results_state=FINAL_RESULTS)**
  print the final iterator results
Private Member Functions

- void `optimize_gaussian_process()`
  construct the GP using EGO/SKO
- void `importance_sampling()`
  perform multimodal adaptive importance sampling on the GP
- void `get_best_sample()`
  determine current best solution from among sample data for expected improvement function in Performance Measure Approach (PMA)
- Real `constraint_penalty` (const Real &constraint, const RealVector &c_variables)
  calculate the penalty to be applied to the PMA constraint value
- Real `expected_improvement` (const RealVector &expected_values, const Variables &recast_vars)
  expected improvement function for the GP
- Real `expected_feasibility` (const RealVector &expected_values, const Variables &recast_vars)
  expected feasibility function for the GP

Static Private Member Functions

- static void `EIF_objective_eval` (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)
  static function used as the objective function in the Expected Improvement (EIF) problem formulation for PMA
- static void `EFF_objective_eval` (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)
  static function used as the objective function in the Expected Feasibility (EFF) problem formulation for RIA

Private Attributes

- Real `fnStar`
  minimum penalized response from among true function evaluations
- short `meritFunctionType`
  type of merit function used to penalize sample data
- Real `lagrangeMult`
  Lagrange multiplier for standard Lagrangian merit function.
- Real `augLagrangeMult`
  Lagrange multiplier for augmented Lagrangian merit function.
- Real `penaltyParameter`
  penalty parameter for augmented Lagrangian merit function
- Real `lastConstraintViolation`
  constraint violation at last iteration, used to determine if the current iterate should be accepted (must reduce violation)
- bool `lastIterateAccepted`
  flag to determine if last iterate was accepted this controls update of parameters for augmented Lagrangian merit fn
- short `dataOrder`
  order of the data used for surrogate construction, in ActiveSet request vector 3-bit format; user may override responses spec
13.121. NONDGLOBALSINGLEINTERVAL CLASS REFERENCE

Static Private Attributes

- static NonDGlobalReliability * nondGlobRelInstance

Additional Inherited Members

13.120.1 Detailed Description

Class for global reliability methods within DAKOTA/UQ.

The NonDGlobalReliability class implements EGO/SKO for global MPP search, which maximizes an expected improvement function derived from Gaussian process models. Once the limit state has been characterized, a multimodal importance sampling approach is used to compute probabilities.

13.120.2 Member Function Documentation

void core_run ( ) [virtual]

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.

References NonDGlobalReliability::importance_sampling(), NonD::initialize_random_variable_parameters(),
NonDGlobalReliability::nondGlobRelInstance, NonDReliability::numRelAnalyses, NonDGlobalReliability::optimize_gaussian_process(), and NonD::transform_correlations().

void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Analyzer.

References NonD::cdfFlag, NonD::computedGenRelLevels, NonD::computedProbLevels, NonD::computedRespLevels, Iterator::iteratedModel, Analyzer::numFunctions, NonD::print_densities(), Model::response_labels(), and Dakota::write_precision.

The documentation for this class was generated from the following files:

  *returns the probability calculated by the importance sampling*
Private Member Functions

- RealVector calcExpIndicator (const int respFnCount, const Real respThresh)
  function to calculate the expected indicator probabilities
- Real calcExpIndPoint (const int respFnCount, const Real respThresh, const RealVector this_mean, const RealVector this_var)
  function to calculate the expected indicator probabilities for one point
- void calcRhoDraw ()
  function to update the rhoDraw data, adding x values and rho draw values
- RealVector drawNewX (int this_k)
  function to pick the next X value to be evaluated by the Iterated model

Private Attributes

- Iterator gpBuild
  LHS iterator for building the initial GP.
- Iterator gpEval
  LHS iterator for sampling on the GP.
- Model gpModel
  GP model of response, one approximation per response function.
- Iterator sampleRhoOne
  LHS iterator for sampling from the rhoOneDistribution.
- int numPtsAdd
  the number of points added to the original set of LHS samples
- int numPtsTotal
  the total number of points
- int numEmulEval
  the number of points evaluated by the GP each iteration
- Real finalProb
  the final calculated probability (p)
- RealVectorArray gpCvars
  Vector to hold the current values of the current sample inputs on the GP.
- RealVectorArray gpMeans
  Vector to hold the current values of the current mean estimates for the sample values on the GP.
- RealVectorArray gpVar
  Vector to hold the current values of the current variance estimates for the sample values on the GP.
- RealVector expIndicator
  Vector to hold the expected indicator values for the current GP samples.
- RealVector rhoDraw
  Vector to hold the rhoDraw values for the current GP samples.
- RealVector normConst
  Vector to hold the normalization constant calculated for each point added.
- RealVector indicator
  IntVector to hold indicator for actual simulation values vs. threshold.
13.122. NONDGPIMPSAMPLING CLASS REFERENCE

- RealVectorArray xDrawThis
  xDrawThis, appended to locally to hold the X values of emulator points chosen
- RealVector expIndThis
  expIndThis, appended locally to hold the expected indicator
- RealVector rhoDrawThis
  rhoDrawThis, appended locally to hold the rhoDraw density for calculating draws
- RealVector rhoMix
  rhoMix, mixture density
- RealVector rhoOne
  rhoOne, original importance density

Additional Inherited Members

13.122.1 Detailed Description

Class for the Gaussian Process-based Importance Sampling method.

The NonDGPImpSampling implements a method developed by Keith Dalbey that uses a Gaussian process surrogate in the calculation of the importance density. Specifically, the mean and variance of the GP prediction are used to calculate an expected value that a particular point fails, and that is used as part of the computation of the "draw distribution." The normalization constants and the mixture distribution used are defined in (need to get SAND report).

13.122.2 Constructor & Destructor Documentation

NonDGPImpSampling ( ProblemDescDB & problem_db, Model & model )

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

13.123.1 Detailed Description

Generates posterior distribution on model parameters given experiment data.

This class provides a wrapper for the functionality provided in the Los Alamos National Laboratory code called GPM/SA (Gaussian Process Models for Simulation Analysis). Although this is a code that provides input/output mapping, it DOES NOT provide the mapping that we usually think of in the NonDeterministic class hierarchy in DAKOTA, where uncertainty in parameter inputs are mapped to uncertainty in simulation responses. Instead, this class takes a pre-existing set of simulation data as well as experimental data, and maps priors on input parameters to posterior distributions on those input parameters, according to a likelihood function. The goal of the MCMC sampling is to produce posterior values of parameter estimates which will produce simulation response values that "match well" to the experimental data. The MCMC is an integral part of the calibration. The data
structures in GPM/SA are fairly detailed and nested. Part of this prototyping exercise is to determine what data structures need to be specified and initialized in DAKOTA and sent to GPM/SA, and what data structures will be returned.

13.123.2 Constructor & Destructor Documentation

NonDGPMSABayesCalibration ( ProblemDescDB & problem_db, Model & model )

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), NonDGPMSSABayesCalibration::approxImportActiveOnly, NonDGPMSSABayesCalibration::approxImportFile, Iterator::assign_rep(), NonDGPMSSABayesCalibration::buildSamples, Model::current_response(), NonDGMSSABayesCalibration::emulatorType, NonDCalibration::expData, ProblemDescDB::get_string(), NonDGPMSSABayesCalibration::lhsIter, NonDGMSSABayesCalibration::mcmcModel, ExperimentData::num_experiments(), SharedResponseData::num_field_response_groups(), Iterator::outputLevel, Iterator::probDescDB, NonDGMSSABayesCalibration::randomSeed, Response::shared_data(), and NonDGPMSSABayesCalibration::userConfigVars.

13.123.3 Member Function Documentation

void calibrate ( ) [protected], [virtual]

performs a forward uncertainty propagation by using GPM/SA to generate a posterior distribution on parameters given a set of simulation parameter/response data, a set of experimental data, and additional variables to be specified here.

Perform the uncertainty quantification

Implements NonDBayesCalibration.

References NonDQUESOBayesCalibration::advancedOptionsFile, ExperimentData::all_data(), NonDGPMSSABayesCalibration::buildSamples, NonDGPMSSABayesCalibration::cache_acceptance_chain(), NonDQUESOBayesCalibration::callIpMhOptionsValues, NonDGMSSABayesCalibration::compute_statistics(), NonDGPMSSABayesCalibration::configSpace, NonDCalibration::expData, NonDGPMSSABayesCalibration::experimentSpace, NonDGPMSSABayesCalibration::fill_experiment_data(), NonDGPMSSABayesCalibration::fill_simulation_data(), NonDGPMSSABayesCalibration::gpmsaConfigVars, NonDGPMSSABayesCalibration::gpmsaFactory, NonDGPMSSABayesCalibration::gpmsaNormalize, NonDGPMSSABayesCalibration::gpmsaOptions, NonDQUESOBayesCalibration::init_parameter_domain(), NonDGPMSSABayesCalibration::init_queso_solver(), NonDGMSSABayesCalibration::initialize_model(), NonDQUESOBayesCalibration::inverseProb, NonDQUESOBayesCalibration::mcmcType, NonDGPMSSABayesCalibration::mEtaSpace, NonDGPMSSABayesCalibration::nonDGMSSABayesCalibration::nonDGPMSSABayesCalibration::nonDGPMSSABayesCalibration::nonDGPMSSABayesCalibration::nEtaSpace, NonDQUESOBayesCalibration::numHyperparams, Iterator::outputLevel, NonDGPMSSABayesCalibration::overlay_initial_params(), NonDGPMSSABayesCalibration::overlay_proposal_covariance(), NonDQUESOBayesCalibration::paramSpace, NonDQUESOBayesCalibration::priorRv, NonDQUESOBayesCalibration::quesoEnv, and NonDGMSSABayesCalibration::standardizedSpace.

void fill_simulation_data ( ) [protected]

populate the simulation data, calculating and applying scaling if needed

simulation data, one row per simulation build sample, columns for calibration variables, configuration variables, function values (duplicates storage, but unifies import vs. DOE cases)
References NonDGPMSABayesCalibration::acquire_simulation_data(), NonDGPMSABayesCalibration::buildSamples, NonDGPMSABayesCalibration::configSpace, NonDGPMSABayesCalibration::gpmsaConfigVars, NonDGPMSABayesCalibration::gpmsaFactory, NonDGPMSABayesCalibration::nEtaSpace, Analyzer::numContinuousVars, Analyzer::numFunctions, NonDQUESOBayesCalibration::paramSpace, and NonDGPMSABayesCalibration::userConfigVars.

Referenced by NonDGPMSABayesCalibration::calibrate().

```cpp
void cache_acceptance_chain() [protected]
```

retrieve the chain from QUESO and populate acceptanceChain / acceptedFnVals

This is a subset of the base class retrieval, but we can’t do the fn value lookups. Eventually should be able to retrieve them from GPMSA.

References NonDBayesCalibration::acceptanceChain, NonDBayesCalibration::acceptedFnVals, NonDBayesCalibration::chainSamples, NonDQUESOBayesCalibration::copy gsl partial(), NonDQUESOBayesCalibration::inverseProb, NonD::natafTransform, Analyzer::numContinuousVars, Analyzer::numFunctions, NonDBayesCalibration::numHyperparams, Iterator::outputLevel, NonDQUESOBayesCalibration::postRv, and NonDBayesCalibration::standardizedSpace.

Referenced by NonDGPMSABayesCalibration::calibrate().

```cpp
void print_results(std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
```

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from NonDBayesCalibration.

References NonDBayesCalibration::print_results().

The documentation for this class was generated from the following files:

- NonDGPMSABayesCalibration.hpp
- NonDGPMSABayesCalibration.cpp

### 13.124 NonDIntegration Class Reference

Derived nondeterministic class that generates N-dimensional numerical integration points for evaluation of expectation integrals.

Inheritance diagram for NonDIntegration:
13.124. NONDINTEGRATION CLASS REFERENCE

```
#include <vector>

class NonDIntegration
{
public:
    // Public Member Functions

    // Initializes the integration grid by drawing from polynomial basis settings.
    virtual void initialize_grid(const std::vector<Pecos::BasisPolynomial> &poly_basis) = 0;

    // Increments the SSG level/TPQ order.
    virtual void increment_grid() = 0;

    // Increments the SSG level/TPQ order and updates anisotropy.
    virtual void increment_grid_preference(const RealVector &dim_pref);

    // Increments the SSG level/TPQ order and preserves anisotropy.
    virtual void increment_grid_preference();

    // Increments the SSG level/TPQ order and updates anisotropy.
    virtual void increment_grid_weights(const RealVector &aniso_wts);

    // Increments the SSG level/TPQ order and preserves anisotropy.
    virtual void increment_grid_weights();

    // Decrements the SSG level/TPQ order.
    virtual void decrement_grid() = 0;

    // Evaluates the grid increment.
    virtual void evaluate_grid_increment();

    // Restores a previously computed grid increment (no new evaluations).
    virtual void push_grid_increment();

    // Removes a previously computed grid increment.
    virtual void pop_grid_increment();

    // Merges a grid increment into the reference grid.
    virtual void merge_grid_increment();

    // Updates the reference grid within adaptive grid refinement procedures.
    virtual void update_reference();

    // Returns the number of integration drivers.
    const Pecos::IntegrationDriver &driver() const;

    // Reinitializes the iterator based on new variable size.
    bool resize();

private:
    NonDIntegration();
    NonDIntegration(const NonDIntegration &); // Copy constructor
    NonDIntegration &operator=(const NonDIntegration &); // Assignment operator
};
```

The public member functions of the NonDIntegration class are designed to facilitate the manipulation of integration grids, including the initialization, incrementation, and decrementation of grid levels, as well as the evaluation of grid increments and the handling of anisotropy. The class also provides methods for accessing and updating the integration drivers and for reinitializing the iterator based on changes in the variable size.

13.124.1 Detailed Description

Derived nondeterministic class that generates N-dimensional numerical integration points for evaluation of expectation integrals.

This class provides a base class for shared code among NonDQuadrature and NonDSparseGrid.
13.124. Constructor & Destructor Documentation

NonDIntegration ( ProblemDescDB & problem_db, Model & model ) [protected]

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes
has been called and probDescDB can be queried for settings from the method specification. It is not currently
used, as there are not yet separate nond_quadrature/nond_sparse_grid method specifications.

References Dakota::abort_handler(), NonD::initialize_final_statistics(), NonD::initialize_random_variable_correlations(),
NonD::initialize_random_variable_transformation(), NonD::initialize_random_variable_types(), Analyzer::numDiscrete-
IntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, and NonD::verify_correlation_support().

NonDIntegration ( unsigned short method_name, Model & model ) [protected]

alternate constructor for instantiations "on the fly"

This alternate constructor is used for on-the-fly generation and evaluation of numerical integration points.

NonDIntegration ( unsigned short method_name, Model & model, const RealVector & dim_pref ) [protected]

alternate constructor for instantiations "on the fly"

This alternate constructor is used for on-the-fly generation and evaluation of numerical integration points.

13.124.3 Member Function Documentation

void dimension_preference_to_anisotropic_order ( unsigned short scalar_order_spec, const RealVector &
dim_pref_spec, size_t num_v, UShortArray & aniso_order ) [static]

convert scalar_order_spec and vector dim_pref_spec to vector aniso_order

Converts a scalar order specification and a vector anisotropic dimension preference into an anisotropic order
vector. It is used for initialization and does not enforce a reference lower bound (see also NonDQuadrature-::update_anisotropic_order()).

Referenced by NonDPolynomialChaos::config_expansion_orders(), NonDQuadrature::initialize_dimension_quadrature_order(), and NonDMultilevelPolynomialChaos::update_from_specification().

void anisotropic_order_to_dimension_preference ( const UShortArray & aniso_order, unsigned short &
scalar_order, RealVector & dim_pref ) [static]

convert vector aniso_order to scalar_order and vector dim_pref

Converts a vector anisotropic order into a scalar order and vector anisotropic dimension preference.

Referenced by NonDPolynomialChaos::config_regression().

void core_run ( ) [protected], [virtual]

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.

References NonDIntegration::check_variables(), Analyzer::evaluate_parameter_sets(), Analyzer::get_parameter_sets(), Iterator::iteratedModel, NonD::natafTransform, and NonDIntegration::numIntegrations.
void check_variables ( const std::vector<Pecos::RandomVariable> & ran_vars ) [protected]

verify self-consistency of variables data
Virtual function called from probDescDB-based constructors and from NonDIntegration::core_run()
References Dakota::abort_handler(), NonD::numContAleatUncVars, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContIntervalVars, Analyzer::numContinuousVars, and NonD::numContStateVars.

13.125 NonDInterval Class Reference

Base class for interval-based methods within DAKOTA/UQ.
Inheritance diagram for NonDInterval:

Public Member Functions
• NonDInterval (ProblemDescDB &problem_db, Model &model)
constructor
• ~NonDInterval ()
destructor
• void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  print the cumulative distribution functions for belief and plausibility
• bool resize ()
  reinitializes iterator based on new variable size

Protected Member Functions
• void initialize_final_statistics ()
  initialize finalStatistics for belief/plausibility results sets
• void compute_evidence_statistics ()
  method for computing belief and plausibility values for response levels or vice-versa
• void calculate_cells_and_bpas ()
  computes the interval combinations (cells) and their bpas replaces CBPIIC.F77 from wrapper calculate_basic_prob_intervals()
void calculate_cbf_cpf (bool complementary=true)

  function to compute (complementary) distribution functions on belief and plausibility replaces CCBFPF_F77 from
  wrapper calculate_cum_belief_plaus()

Protected Attributes

  • bool singleIntervalFlag
    flag for SingleInterval derived class
  • RealVectorArray ccBelFn
    Storage array to hold CCBF values.
  • RealVectorArray ccPlausFn
    Storage array to hold CCPF values.
  • RealVectorArray ccBelVal
    Storage array to hold CCB response values.
  • RealVectorArray ccPlausVal
    Storage array to hold CCP response values.
  • RealVectorArray cellContLowerBounds
    Storage array to hold cell lower bounds for continuous variables.
  • RealVectorArray cellContUpperBounds
    Storage array to hold cell upper bounds for continuous variables.
  • IntVectorArray cellIntRangeLowerBounds
    Storage array to hold cell lower bounds for discrete int range variables.
  • IntVectorArray cellIntRangeUpperBounds
    Storage array to hold cell upper bounds for discrete int range variables.
  • IntVectorArray cellIntSetBounds
    Storage array to hold cell values for discrete integer set variables.
  • IntVectorArray cellRealSetBounds
    Storage array to hold cell values for discrete real set variables.
  • RealVectorArray cellFnLowerBounds
    Storage array to hold cell min.
  • RealVectorArray cellFnUpperBounds
    Storage array to hold cell max.
  • RealVector cellBPA
    Storage array to hold cell bpa.
  • size_t respFnCntr
    response function counter
  • size_t cellCntr
    cell counter
  • size_t numCells
    total number of interval combinations
Additional Inherited Members

13.125.1 Detailed Description

Base class for interval-based methods within DAKOTA/UQ.

The NonDInterval class implements the propagation of epistemic uncertainty using either pure interval prop-agation or Dempster-Shafer theory of evidence. In the latter approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated, along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

The documentation for this class was generated from the following files:

- NonDInterval.hpp
- NonDInterval.cpp

13.126 NonDLHSEvidence Class Reference

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

Inheritance diagram for NonDLHSEvidence:

```
    Iterator

  *read tabular data for post-run mode*

- void **update_final_statistics** ()
  
  *update finalStatistics and (if MC sampling) finalStatErrors*

- void **compute_pca** (std::ostream &s)
compute a principal components analysis on the sample set
• void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  print the final statistics
• void d_optimal_parameter_set (int previous_samples, int new_samples, RealMatrix &full_samples)
  generate a d-optimal parameter set, leaving the first previous_samples columns intact and adding new_samples new columns following them
• void initial_increm_lhs_set (int new_samples, RealMatrix &full_samples, IntMatrix &full_ranks)
  Populate the first new_samples columns of allSamples with an LHS design and update the stored ranks.
• void increm_lhs_parameter_set (int previous_samples, int new_samples, RealMatrix &full_samples, IntMatrix &all_ranks)
  generate a new batch that is Latin w.r.t. the previous samples
• void store_ranks (const RealMatrix &sample_values, IntMatrix &sample_ranks)
  store the ranks of the last generated sample for continuous (based on sampleRanks) and calculate/store discrete ranks
• void store_ranks (IntMatrix &full_ranks)
  store the combined ranks from sampleRanks to leading submatrix local cached ranks matrix
• void combine_discrete_ranks (const RealMatrix &initial_values, const RealMatrix &increm_values)
  merge the discrete ranks into a submatrix of sampleRanks
• void print_header_and_statistics (std::ostream &s, const int &num_samples)
  Print a header and summary statistics.
• void archive_results (int num_samples, size_t ind_inc=0)
  Archive all results.

Static Protected Member Functions
• static bool rank_sort (const int &x, const int &y)
  sort algorithm to compute ranks for rank correlations

Private Attributes
• size_t numResponseFunctions
  number of response functions; used to distinguish NonD from opt/NLS usage
• IntVector refineSamples
  list of refinement sample batch sizes
• bool dOptimal
  whether to generate d-optimal point sets
• size_t numCandidateDesigns
  number of candidate designs to generate for classical D-optimal designs
• Real oversampleRatio
  oversampling ratio for Leja D-optimal candidate set generation
• bool varBasedDecompFlag
  flags computation of variance-based decomposition indices
• bool pcaFlag
  flag to specify the calculation of principal components
• Real percentVarianceExplained
  Threshold to keep number of principal components that explain this much variance.
Static Private Attributes

- static RealArray rawData
  
  static data used by static rank_sort() fn

13.128.1 Detailed Description

Performs LHS and Monte Carlo sampling for uncertainty quantification.

The Latin Hypercube Sampling (LHS) package from Sandia Albuquerque’s Risk and Reliability organization provides comprehensive capabilities for Monte Carlo and Latin Hypercube sampling within a broad array of user-specified probabilistic parameter distributions. It enforces user-specified rank correlations through use of a mixing routine. The NonDLHSSampling class provides a C++ wrapper for the LHS library and is used for performing forward propagations of parameter uncertainties into response statistics.

Batch generation options, including D-Optimal and incremental LHS are provided.

The incremental LHS sampling capability allows one to supplement an initial sample of size n to size 2n while maintaining the correct stratification of the 2n samples and also maintaining the specified correlation structure. The incremental version of LHS will return a sample of size n, which when combined with the original sample of size n, allows one to double the size of the sample.

13.128.2 Constructor & Destructor Documentation

NonDLHSSampling ( ProblemDescDB & problem_db, Model & model )

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), NonDLHSSampling::dOptimal, Model::num_primary_fns(), NonD::num-BinomialVars, NonDLHSSampling::numCandidateDesigns, NonD::numDesignVars, NonD::numEpistemicUnc-Vars, NonD::numGeometricVars, NonD::numHistogramPtIntVars, NonD::numHistogramPtRealVars, NonD::num-HistogramPtStringVars, NonD::numHyperGeomVars, NonD::numNegBinomialVars, NonD::numPoissonVars, NonDLHSSampling::numResponseFunctions, NonD::numStateVars, Iterator::outputLevel, NonDLHSSampling::oversample-Ratio, Model::primary_fn_type(), NonDLHSSampling::refineSamples, and NonDSampling::sampleType.

NonDLHSSampling ( Model & model, unsigned short sample_type, int samples, int seed, const String & rng, bool vary_pattern = true, short sampling_vars_mode = ACTIVE )

alternate constructor for sample generation and evaluation "on the fly"

This alternate constructor is used for generation and evaluation of Model-based sample sets. A set_db_list_nodes has not been performed so required data must be passed through the constructor. It’s purpose is to avoid the need for a separate LHS specification within methods that use LHS sampling.

NonDLHSSampling ( unsigned short sample_type, int samples, int seed, const String & rng, const RealVector & lower_bnds, const RealVector & upper_bnds )

alternate constructor for uniform sample generation "on the fly"

This alternate constructor is used by ConcurrentStrategy for generation of uniform, uncorrelated sample sets. It is not a letter-envelope instantiation and a set_db_list_nodes has not been performed. It is called with all needed data passed through the constructor and is designed to allow more flexibility in variables set definition (i.e., relax
connection to a variables specification and allow sampling over parameter sets such as multiobjective weights). In this case, a Model is not used and the object must only be used for sample generation (no evaluation).

References NonDSampling::get_parameter_sets().

NonDLHSSampling ( unsigned short sample_type, int samples, int seed, const String & rng, const RealVector & means, const RealVector & std_devs, const RealVector & lower_bnds, const RealVector & upper_bnds, RealSymMatrix & correl )

alternate constructor for sample generation of correlated normals "on the fly"

This alternate constructor is used to generate correlated normal sample sets. It is not a letter-envelope instantiation and a set_db_list_nodes has not been performed. It is called with all needed data passed through the constructor. In this case, a Model is not used and the object must only be used for sample generation (no evaluation).

References NonDSampling::get_parameter_sets().

13.128.3 Member Function Documentation

void core_run() [protected], [virtual]

perform the evaluate parameter sets portion of run

Loop over the set of samples and compute responses. Compute statistics on the set of responses if statsFlag is set.

Reimplemented from Iterator.

References NonDSampling::allDataFlag, Analyzer::evaluate_parameter_sets(), Iterator::iteratedModel, NonDLHSSampling::numResponseFunctions, and NonDSampling::statsFlag.

void d_optimal_parameter_set ( int previous_samples, int new_samples, RealMatrix & full_samples ) [protected]

generate a d-optimal parameter set, leaving the first previous_samples columns intact and adding new_samples new columns following them

For now, when this function is called, numSamples is the number of new samples to generate.

References Model::aleatory_distribution_parameters(), Dakota::det_AtransA(), NonDSampling::get_parameter_sets(), Iterator::iteratedModel, NonDSampling::mode_counts(), NonD::natafTransform, NonDLHSSampling::numCandidateDesigns, Iterator::outputLevel, NonDLHSSampling::oversampleRatio, and NonDSampling::transform_samples().

**13.130.1 Detailed Description**

Class for the Dempster-Shafer Evidence Theory methods within DAKOTA/UQ.

The NonDEvidence class implements the propagation of epistemic uncertainty using Dempster-Shafer theory of evidence. In this approach, one assigns a set of basic probability assignments (BPA) to intervals defined for the uncertain variables. Input interval combinations are calculated, along with their BPA. Currently, the response function is evaluated at a set of sample points, then a response surface is constructed which is sampled extensively to find the minimum and maximum within each input interval cell, corresponding to the belief and plausibility within that cell, respectively. This data is then aggregated to calculate cumulative distribution functions for belief and plausibility.

The documentation for this class was generated from the following files:

- NonDLocalEvidence.hpp
- NonDLocalEvidence.cpp

13.131.1 Detailed Description

Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

The NonDLocalInterval class supports local gradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g., intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels.

The documentation for this class was generated from the following files:

- NonDLocalInterval.hpp
- NonDLocalInterval.cpp

13.132 NonDLocalReliability Class Reference

Class for the reliability methods within DAKOTA/UQ.

Inheritance diagram for NonDLocalReliability:

```

  Analyzer
  Iterator
```

Public Member Functions

- NonDLocalReliability (ProblemDescDB &problem_db, Model &model)
  
  constructor

- ~NonDLocalReliability ()
  
  destructor

- void derived_init_communicators (ParLevIter pl_iter)
  
  derived class contributions to initializing the communicators associated with this Iterator instance

- void derived_set_communicators (ParLevIter pl_iter)
• void derived_free_communicators (ParLevLIter pl_iter)
  derived class contributions to setting the communicators associated with this Iterator instance

• void core_run ()
  performs an uncertainty propagation using analytical reliability methods which solve constrained optimization problems to obtain approximations of the cumulative distribution function of response

• void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  print the approximate mean, standard deviation, and importance factors when using the mean value method or the CDF/CCDF information when using MPP-search-based reliability methods

• unsigned short uses_method () const
  return name of active MPP optimizer

• void method_recourse ()
  perform an MPP optimizer method switch due to a detected conflict

Private Member Functions

• void initial_taylor_series ()
  convenience function for performing the initial limit state Taylor-series approximation

• void mean_value ()
  convenience function for encapsulating the simple Mean Value computation of approximate statistics and importance factors

• void mpp_search ()
  convenience function for encapsulating the reliability methods that employ a search for the most probable point (AMV, AMV+, FORM, SORM)

• void initialize_class_data ()
  convenience function for initializing class scope arrays

• void initialize_level_data ()
  convenience function for initializing/warm starting MPP search data for each response function prior to level 0

• void initialize_mpp_search_data ()
  convenience function for initializing/warm starting MPP search data for each z/p/beta level for each response function

• void update_mpp_search_data (const Variables &vars_star, const Response &resp_star)
  convenience function for updating MPP search data for each z/p/beta level for each response function

• void update_level_data ()
  convenience function for updating z/p/beta level data and final statistics following MPP convergence

• void update_pma_maximize (const RealVector &mpp_u, const RealVector &fn_grad_u, const RealSymMatrix &fn_hess_u)
  update pmaMaximizeG from prescribed probabilities or prescribed generalized reliabilities by inverting second-order integrations

• void update_limit_state_surrogate ()
  convenience function for passing the latest variables/response data to the data fit embedded within uSpaceModel

• void assign_mean_data ()
  update mostProbPointX/U, computedRespLevel, fnGradX/U, and fnHessX/U from ranVarMeansX/U, fnValsMeanX, fnGradsMeanX, and fnHessiansMeanX

• void dg_ds_eval (const RealVector &x_vars, const RealVector &fn_grad_x, RealVector &final_stat_grad)
convenience function for evaluating dg/ds

- **Real dp2_dbeta_factor (Real beta, bool cdf_flag)**
  compute factor for derivative of second-order probability with respect to reliability index (from differentiating BR-EITUNG or HOHENRACK expressions)

- **Real signed_norm (const RealVector &mpp_u, const RealVector &fn_grad_u, bool cdf_flag)**
  convert norm of mpp_u (u-space solution) to a signed reliability index

- **Real signed_norm (Real norm_mpp_u)**
  convert norm of u-space vector to a signed reliability index

- **Real signed_norm (Real norm_mpp_u, const RealVector &mpp_u, const RealVector &fn_grad_u, bool cdf_flag)**
  shared helper function

- **Real probability (Real beta)**
  Convert reliability to probability using a first-order integration.

- **Real probability (bool cdf_flag, const RealVector &mpp_u, const RealVector &fn_grad_u, const RealSymMatrix &fn_hess_u)**
  Convert computed reliability to probability using either a first-order or second-order integration.

- **Real probability (Real beta, bool cdf_flag, const RealVector &mpp_u, const RealVector &fn_grad_u, const RealSymMatrix &fn_hess_u)**
  Convert provided reliability to probability using either a first-order or second-order integration.

- **Real reliability (Real p)**
  Convert probability to reliability using the inverse of a first-order integration.

- **Real reliability (Real p, bool cdf_flag, const RealVector &mpp_u, const RealVector &fn_grad_u, const RealSymMatrix &fn_hess_u)**
  Convert probability to reliability using the inverse of a first-order or second-order integration.

- **bool reliability_residual (const Real &p, const Real &beta, const RealVector &kappa, Real &res)**
  compute the residual for inversion of second-order probability corrections using Newton’s method (called by reliability(p))

- **Real reliability_residual_derivative (const Real &p, const Real &beta, const RealVector &kappa)**
  compute the residual derivative for inversion of second-order probability corrections using Newton’s method (called by reliability(p))

- **void principal_curvatures (const RealVector &mpp_u, const RealVector &fn_grad_u, const RealSymMatrix &fn_hess_u, RealVector &kappa_u)**
  Compute the kappaU vector of principal curvatures from fnHessU.

- **void scale_curvature (Real beta, bool cdf_flag, const RealVector &kappa, RealVector &scaled_kappa)**
  scale copy of principal curvatures by -1 if needed; else take a view

**Static Private Member Functions**

- **static void RIA_objective_eval (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)**
  static function used as the objective function in the Reliability Index Approach (RIA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the objective function of \((\text{norm } u)^2\).

- **static void RIA_constraint_eval (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)**
static function used as the constraint function in the Reliability Index Approach (RIA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the constraint of $G(u) = \text{response level}$.

• static void PMA_objective_eval (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)

static function used as the objective function in the Performance Measure Approach (PMA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the objective function of $G(u)$.

• static void PMA_constraint_eval (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)

static function used as the constraint function in the first-order Performance Measure Approach (PMA) problem formulation. This optimization problem performs the search for the most probable point (MPP) with the equality constraint of $(\|u\|)^2 = (\beta - \bar{\beta})^2$.

• static void PMA2_constraint_eval (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)

static function used as the constraint function in the second-order Performance Measure Approach (PMA) problem formulation. This optimization problem performs the search for the most probable point (MPP) with the equality constraint of $\beta^* = \beta - \bar{\beta}$.

• static void PMA2_set_mapping (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)

static function used to augment the sub-model ASV requests for second-order PMA

Private Attributes

• Real computedRespLevel
  output response level calculated

• Real computedRelLevel
  output reliability level calculated for RIA and 1st-order PMA

• Real computedGenRelLevel
  output generalized reliability level calculated for 2nd-order PMA

• RealVector fnGradX
  actual x-space gradient for current function from most recent response evaluation

• RealVector fnGradU
  u-space gradient for current function updated from fnGradX and Jacobian $dx/du$

• RealSymMatrix fnHessX
  actual x-space Hessian for current function from most recent response evaluation

• RealSymMatrix fnHessU
  u-space Hessian for current function updated from fnHessX and Jacobian $dx/du$

• RealVector kappaU
  principal curvatures derived from eigenvalues of orthonormal transformation of fnHessU

• RealVector fnValsMeanX
  response function values evaluated at mean x

• RealMatrix fnGradsMeanX
  response function gradients evaluated at mean x

• RealSymMatrixArray fnHessiansMeanX
  response function Hessians evaluated at mean x
**RealVector** ranVarMeansX
  vector of means for all uncertain random variables in x-space

**RealVector** ranVarStdDevsX
  vector of std deviations for all uncertain random variables in x-space

**RealVector** ranVarMeansU
  vector of means for all uncertain random variables in u-space

**bool** initialPtUserSpec
  flag indicating user specification of (any portion of) initialPtU

**RealVector** initialPtUSpec
  user specification or default initial guess for local optimization

**RealVector** initialPtU
  current starting point for MPP searches in u-space

**RealVector** mostProbPointX
  location of MPP in x-space

**RealVector** mostProbPointU
  location of MPP in u-space

**RealVectorArray** prevMPPULev0
  array of converged MPP’s in u-space for level 0. Used for warm-starting initialPtU within RBDO.

**RealMatrix** prevFnGradDLev0
  matrix of limit state sensitivities w.r.t. inactive/design variables for level 0. Used for warm-starting initialPtU within RBDO.

**RealMatrix** prevFnGradULev0
  matrix of limit state sensitivities w.r.t. active/uncertain variables for level 0. Used for warm-starting initialPtU within RBDO.

**RealVector** prevICVars
  previous design vector. Used for warm-starting initialPtU within RBDO.

**ShortArray** prevCumASVLev0
  accumulation (using |) of all previous design ASV’s from requested finalStatistics. Used to detect availability of prevFnGradDLev0 data for warm-starting initialPtU within RBDO.

**bool** npsolFlag
  flag representing the optimization MPP search algorithm selection (NPSOL SQP or OPT++ NIP)

**bool** warmStartFlag
  flag indicating the use of warm starts

**bool** nipModeOverrideFlag
  flag indicating the use of move overrides within OPT++ NIP

**bool** curvatureDataAvailable
  flag indicating that sufficient data (i.e., fnGradU, fnHessU, mostProbPointU) is available for computing principal curvatures

**bool** kappaUpdated
  track when kappaU requires updating via principal_curvatures()

**short** integrationOrder
  integration order (1 or 2) provided by integration specification

**short** secondOrderIntType
  type of second-order integration: Breitung, Hohenbichler-Rackwitz, or Hong
• Real curvatureThresh
  cut-off value for 1/sqrt() term in second-order probability corrections.

• short taylorOrder
  order of Taylor series approximations (1 or 2) in MV/AMV/AMV+ derived from hessian type

• RealMatrix impFactor
  importance factors predicted by MV

• int npsolDerivLevel
  derivative level for NPSOL executions (1 = analytic grads of objective fn, 2 = analytic grads of constraints, 3 = analytic grads of both).

• unsigned short warningBits
  set of warnings accumulated during execution

**Static Private Attributes**

• static NonDLocalReliability * nondLocRelInstance
  pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data

### Additional Inherited Members

13.132.1 Detailed Description

Class for the reliability methods within DAKOTA/UQ.

The NonDLocalReliability class implements the following reliability methods through the support of different limit state approximation and integration options: mean value (MVFOSM/MVSOSM), advanced mean value method (AMV, AMV^{+2}) in x- or u-space, iterated advanced mean value method (AMV+, AMV^{+2+}) in x- or u-space, two-point adaptive nonlinearity approximation (TANA) in x- or u-space, first order reliability method (FORM), and second order reliability method (SORM). All options except mean value employ an optimizer (currently NPSOL SQP or OPT++ NIP) to solve an equality-constrained optimization problem for the most probable point (MPP). The MPP search may be formulated as the reliability index approach (RIA) for mapping response levels to reliabilities/probabilities or as the performance measure approach (PMA) for performing the inverse mapping of reliability/probability levels to response levels.

13.132.2 Member Function Documentation

```cpp
void RIA_objective_eval ( const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response ) [static], [private]
```

static function used as the objective function in the Reliability Index Approach (RIA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the objective function of \((\text{norm } u)^{+2}\).

This function recasts a \(G(u)\) response set (already transformed and approximated in other recursions) into an RIA objective function.

References Response::active_set_request_vector(), Variables::continuous_variables(), Response::function_gradient_view(), Response::function_hessian_view(), and Response::function_value().

Referenced by NonDLocalReliability::mpp_search().
void RIA_constraint_eval ( const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response ) [static], [private]

static function used as the constraint function in the Reliability Index Approach (RIA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the constraint of \( G(u) = \text{response level} \).

This function recasts a \( G(u) \) response set (already transformed and approximated in other recursions) into an RIA equality constraint.

References Response::active_set_request_vector(), Response::function_gradient(), Response::function_gradient_view(), Response::function_hessian(), Response::function_hessian_view(), NonDLocalReliability::nondLocRelInstance, NonDReliability::requestedTargetLevel, and NonDReliability::respFnCount.

Referenced by NonDLocalReliability::mpp_search().

void PMA_objective_eval ( const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response ) [static], [private]

static function used as the objective function in the Performance Measure Approach (PMA) problem formulation. This equality-constrained optimization problem performs the search for the most probable point (MPP) with the objective function of \( G(u) \).

This function recasts a \( G(u) \) response set (already transformed and approximated in other recursions) into a PMA objective function.

References Response::active_set_request_vector(), Variables::continuous_variables(), NonDLocalReliability::curvatureDataAvailable, Response::function_gradient(), Response::function_gradient_view(), Response::function_hessian(), Response::function_hessian_view(), Response::function_value(), NonDLocalReliability::integrationOrder, NonDLocalReliability::kappaUpdated, NonDReliability::mppSearchType, NonDLocalReliability::nondLocRelInstance, NonDReliability::pmaMaximizeG, NonDReliability::respFnCount, and NonDLocalReliability::update_pma_maximize().

Referenced by NonDLocalReliability::mpp_search().

void PMA_constraint_eval ( const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response ) [static], [private]

static function used as the constraint function in the first-order Performance Measure Approach (PMA) problem formulation. This optimization problem performs the search for the most probable point (MPP) with the equality constraint of \( (\text{norm } u)^2 = (\text{beta-bar})^2 \).

This function recasts a \( G(u) \) response set (already transformed and approximated in other recursions) into a first-order PMA equality constraint on reliability index beta.

References Response::active_set_request_vector(), Variables::continuous_variables(), Response::function_gradient(), Response::function_gradient_view(), Response::function_hessian(), Response::function_hessian_view(), Response::function_value(), NonDLocalReliability::nondLocRelInstance, and NonDReliability::requestedTargetLevel.

Referenced by NonDLocalReliability::mpp_search().

void PMA2_constraint_eval ( const Variables & sub_model_vars, const Variables & recast_vars, const Response & sub_model_response, Response & recast_response ) [static], [private]

static function used as the constraint function in the second-order Performance Measure Approach (PMA) problem formulation. This optimization problem performs the search for the most probable point (MPP) with the equality constraint of \( \text{beta}^* = \text{beta-star} \).

This function recasts a \( G(u) \) response set (already transformed and approximated in other recursions) into a second-order PMA equality constraint on generalized reliability index beta-star.

Referenced by NonDLocalReliability::mpp_search().
void update_level_data ( ) [private]

Convenience function for updating z/p/beta level data and final statistics following MPP convergence.

Updates computedRespLevels/computedProbLevels/computedRelLevels, finalStatistics, warm start, and graphics data.

References Response::active_set_derivative_vector(), Response::active_set_request_vector(), Graphics::add_datapoint(), NonD::cdfFlag, NonDLocalReliability::computedGenRelLevel, NonD::computedGenRelLevels, NonD::computedRespLevels, NonDLocalReliability::computedRelLevel, NonD::computedRespLevels, NonDLocalReliability::dg_ds_eval(), NonDLocalReliability::dp2_dbeta_factor(), NonD::finalStatistics, NonDLocalReliability::fnGradU, NonDLocalReliability::fnGradX, NonDLocalReliability::fnHessU, Response::function_gradient(), OutputManager::graphics(), NonDLocalReliability::integrationOrder, Dakota::length(), NonDReliability::levelCount, NonDLocalReliability::mostProbPointU, NonDLocalReliability::mostProbPointX, Graphics::new_dataset(), Analyzer::numFunctions, NonD::numUncertainVars, ParallelLibrary::output_manager(), Iterator::parallelLib, NonDLocalReliability::prevCumASVLev0, NonDLocalReliability::prevF tolGradULev0, NonDLocalReliability::prevF tolGradUlev0, NonDLocalReliability::probability(), NonDLocalReliability::probability(), NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonDReliability::respFnCount, NonD::respLevelTarget, NonD::respLevelTargetReduce, NonDReliability::statCount, Iterator::subIteratorFlag, NonD::totalLevelRequests, and NonDLocalReliability::warmStartFlag.

Referenced by NonDLocalReliability::mpp_search().

void dg_ds_eval ( const RealVector & x_vars, const RealVector & fn_grad_x, RealVector & final_stat_grad ) [private]

Convenience function for evaluating dg/ds.

Computes dg/ds where s = design variables. Supports potentially overlapping cases of design variable augmentation and insertion.

References Response::active_set_derivative_vector(), Iterator::activeSet, Model::all_continuous_variable_ids(), Model::component_parallel_mode(), Dakota::contains(), Model::continuous_variable_ids(), Model::continuous_variables(), Dakota::copy_data(), Model::current_response(), ActiveSet::derivative_vector(), Model::evaluate(), NonD::finalStatistics, Response::function_gradient_copy(), Response::function_gradients(), Model::inactive_continuous_variable_ids(), Iterator::iteratedModel, NonDReliability::mppSearchType, NonD::natafTransform, Iterator::primaryACVarMapIndices, ActiveSet::request_value(), ActiveSet::request_values(), NonDReliability::respFnCount, Iterator::secondaryACVarMapTargets, and NonDReliability::uSpaceModel.

Referenced by NonDLocalReliability::mean_value(), NonDLocalReliability::mpp_search(), and NonDLocalReliability::update_level_data().

Real dp2_dbeta_factor ( Real beta, bool cdf_flag ) [private]

Compute factor for derivative of second-order probability with respect to reliability index (from differentiating BREITUNG or HOHENRACK expressions).

Computes sensitivity of second-order probability w.r.t. beta for use in derivatives of p_2 or beta* w.r.t. auxiliary parameters s (design, epistemic) or derivatives of beta* w.r.t. u in PMA2_constraint_eval().

References Dakota::abort_handler(), NonDLocalReliability::curvatureDataAvailable, NonDLocalReliability::curvatureThresh, NonDLocalReliability::kappaU, NonD::numUncertainVars, NonDLocalReliability::probability(), NonDLocalReliability::scale_curvature(), NonDLocalReliability::secondOrderIntType, and NonDLocalReliability::warningBits.

Referenced by NonDLocalReliability::PMA2_constraint_eval(), and NonDLocalReliability::update_level_data().
Real probability (Real beta, bool cdf_flag, const RealVector & mpp_u, const RealVector & fn_grad_u, const RealSymMatrix & fn_hess_u) [private]

Convert provided reliability to probability using either a first-order or second-order integration.

Converts beta into a probability using either first-order (FORM) or second-order (SORM) integration. The SORM calculation first calculates the principal curvatures at the MPP (using the approach in Ch. 8 of Haldar & Mahadevan), and then applies correction formulations from the literature (Breitung, Hohenbichler-Rackwitz, or Hong).

Additional Inherited Members

13.133.1 Detailed Description

Class for using local gradient-based optimization approaches to calculate interval bounds for epistemic uncertainty quantification.

The NonDLocalSingleInterval class supports local gradient-based optimization approaches to determining interval bounds for epistemic UQ. The interval bounds may be on the entire function in the case of pure interval analysis (e.g., intervals on input = intervals on output), or the intervals may be on statistics of an "inner loop" aleatory analysis such as intervals on means, variances, or percentile levels.

The documentation for this class was generated from the following files:

- NonDLocalSingleInterval.hpp
- NonDLocalSingleInterval.cpp

13.134.1 Detailed Description

Nonintrusive polynomial chaos expansion approaches to uncertainty quantification.

The NonDMultilevelPolynomialChaos class uses a polynomial chaos expansion (PCE) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the OrthogPolyApproximation class to manage multiple types of orthogonal polynomials within a Wiener-Askey scheme to PCE. It supports PCE coefficient estimation via sampling, quadrature, point-collocation, and file import.

13.135 NonDMultilevelSampling Class Reference

Performs Multilevel Monte Carlo sampling for uncertainty quantification.

Inheritance diagram for NonDMultilevelSampling:

```
NonDMultilevelSampling
  NonDSampling
    NonD
      NonDMultilevelSampling
```

Public Member Functions

- **NonDMultilevelSampling** (ProblemDescDB &problem_db, Model &model)
  
  *standard constructor*
• ~NonDMultilevelSampling()
  destructor
• bool resize()
  reinitializes iterator based on new variable size

Protected Member Functions

• void pre_run()
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori
• void core_run()
• void post_run(std::ostream &s)
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way
• void print_results(std::ostream &s, short results_state=FINAL_RESULTS)
  print the final iterator results

Private Member Functions

• void multilevel_mc_Ysum(unsigned short model_form)
  Perform multilevel Monte Carlo across the discretization levels for a particular model form using discrepancy accumulators (sum_Y)
• void multilevel_mc_Qsum(unsigned short model_form)
  Perform multilevel Monte Carlo across the discretization levels for a particular model form using QoI accumulators (sum_Q)
• void control_variate_mc(const UShortArray &lf_key, const UShortArray &hf_key)
  Perform control variate Monte Carlo across two model forms.
• void multilevel_control_variate_mc_Ycorr(unsigned short lf_model_form, unsigned short hf_model_form)
  Perform multilevel Monte Carlo across levels in combination with control variate Monte Carlo across model forms at each level; CV computes correlations for Y (LH correlations for level discrepancies)
• void multilevel_control_variate_mc_Qcorr(unsigned short lf_model_form, unsigned short hf_model_form)
  Perform multilevel Monte Carlo across levels in combination with control variate Monte Carlo across model forms at each level; CV computes correlations for Q (LH correlations for QoI)
• void shared_increment(size_t iter, size_t lev)
  perform a shared increment of LF and HF samples for purposes of computing/updating the evaluation ratio and the MSE ratio
• bool lf_increment(Real avg_eval_ratio, const SizetArray &N_lf, const SizetArray &N_hf, size_t iter, size_t lev)
  perform final LF sample increment as indicated by the evaluation ratio
• void aggregated_models_mode()
  synchronize iteratedModel and activeSet on AGGREGATED_MODELS mode
• void bypass_surrogate_mode()
  synchronize iteratedModel and activeSet on BYPASS_SURROGATE mode
• void uncorrected_surrogate_mode()
  synchronize iteratedModel and activeSet on UNCORRECTED_SURROGATE mode
void configure_indices (unsigned short lev, unsigned short model_form, const RealVector &cost, Real &lev_cost)  
manage response mode, model indices, and aggregate level cost

void configure_indices (unsigned short lev, unsigned short model_form)  
manage response mode and model indices

void initialize_ml_Ysums (IntRealMatrixMap &sum_Y, size_t num_lev)  
initialize the ML accumulators for computing means, variances, and covariances across fidelity levels

void initialize_ml_Qsums (IntRealMatrixMap &sum_Ql, IntRealMatrixMap &sum_Qlm1, IntIntPairRealMatrixMap &sum_QlQlm1, size_t num_lev)  
initialize the ML accumulators for computing means, variances, and covariances across fidelity levels

initialize the CV accumulators for computing means, variances, and covariances across fidelity levels

initialize the MLCV accumulators for computing means, variances, and covariances across fidelity levels

void initialize_mlcv_Qsums (IntRealMatrixMap &sum_Ql, IntRealMatrixMap &sum_Qlm1, size_t lev, const RealVector &offset, SizetArray &num_Q)  
update running QoI sums for one model (sum_Ql) using set of model evaluations within allResponses; used for level 0 from other accumulators

void initialize_mlcv_Ysums (IntRealMatrixMap &sum_Y, RealMatrix &sum_YY, size_t lev, const RealVector &offset, SizetArray &num_Y)  
update accumulators for multilevel telescoping running sums using set of model evaluations within allResponses

void accumulate_offset (RealVector &mu)  
accumulate initial approximation to mean vector, for use as offsets in subsequent accumulations

void accumulate_ml_Qsums (IntRealMatrixMap &sum_Q, size_t lev, const RealVector &offset, SizetArray &num_Q)  
update running QoI sums for one model (sum_Ql) using set of model evaluations within allResponses

void accumulate_ml_Ysums (IntRealMatrixMap &sum_Y, RealMatrix &sum_YY, size_t lev, const RealVector &offset, SizetArray &num_Y)  
update accumulators for multilevel telescoping running sums using set of model evaluations within allResponses

void accumulate_ml_Qsums (IntRealMatrixMap &sum_Ql, IntRealMatrixMap &sum_Qlm1, IntIntPairRealMatrixMap &sum_QlQlm1, size_t lev, const RealVector &offset, SizetArray &num_Q)  
update running QoI sums for two models (sum_Ql, sum_Qlm1) using set of model evaluations within allResponses

void accumulate_cv_sums (IntRealVectorMap &sum_L, const RealVector &offset, SizetArray &num_L)  
update running sums for one model (sum_Ll) using set of model evaluations within allResponses

update running sums for two models (sum_Ll, sum_Hl) from set of low/high fidelity model evaluations within allResponses

void accumulate_mlcv_Qsums (IntRealMatrixMap &sum_Ql, IntRealMatrixMap &sum_Qlm1, size_t lev, const RealVector &offset, SizetArray &num_Q)
update running QoI sums for one model at two levels \((\text{sum}_L, \text{sum}_{Lm1})\) using set of model evaluations within allResponses

- void accumulate\textunderscore mlcv\textunderscore Ysums (IntRealMatrixMap &\text{sum}_Y, size_t lev, const RealVector &\text{offset}, Sizet\text{-}Array &\text{num}_Y)

update running discrepancy sums for one model \((\text{sum}_L)\) using set of model evaluations within allResponses

- void accumulate\textunderscore mlcv\textunderscore Qsums (const IntResponseMap &lf\_resp\textunderscore map, const IntResponseMap &hf\_resp\textunderscore map, IntRealMatrixMap &\text{sum}\_L\_shared, IntRealMatrixMap &\text{sum}\_L\_refined, IntRealMatrixMap &\text{sum}\_H, IntRealMatrixMap &\text{sum}\_LL, IntRealMatrixMap &\text{sum}\_LH, IntRealMatrixMap &\text{sum}\_HH, size_t lev, const RealVector &lf\_offset, const RealVector &hf\_offset, const RealVector &\text{offset}, Sizet\text{-}Array &\text{num}_L, Sizet\text{-}Array &\text{num}_H)

update running QoI sums for two models \((\text{sum}_L, \text{sum}_H, \text{sum}_{LL}, \text{sum}_{LH}, \text{and sum}_{HH})\) from set of low/high fidelity model evaluations within \(\{lf, hf\}_\text{resp\_map}\); used for level 0 from other accumulators

  compute matrix control variate parameters

- void apply_control (Real sum_H, Real sum_L_shared, size_t N_shared, Real sum_L_refined, size_t N_refined, Real beta, Real &H_raw_mom)

  apply scalar control variate parameter (beta) to approximate HF moment

- void apply_control (Real sum_H, Real sum_Hm1, Real sum_L0, Real sum_Lm1, size_t N_shared, Real sum_L_refined, Real sum_Lm1_refined, size_t N_refined, Real beta, Real gamma, Real &H_raw_mom)

  apply scalar control variate parameter (beta) to approximate HF moment
void apply_control (const RealVector &sum_H, const RealVector &sum_L_shared, const SizetArray &N_shared, const RealVector &sum_L_refined, const SizetArray &N_refined, const RealVector &beta, RealVector &H_raw_mom)

apply vector control variate parameter (beta) to approximate HF moment

void apply_control (const RealMatrix &sum_H, const RealMatrix &sum_L_shared, const SizetArray &N_shared, const RealMatrix &sum_L_refined, const SizetArray &N_refined, const RealVector &beta, RealVector &H_raw_mom)

apply matrix control variate parameter (beta) to approximate HF moment

void apply_control (const RealMatrix &sum_Hl, const RealMatrix &sum_Hlm1, const RealMatrix &sum_Ll, const RealMatrix &sum_Llm1, const SizetArray &N_shared, const RealMatrix &sum_Ll_refined, const RealMatrix &sum_Llm1_refined, const SizetArray &N_refined, size_t lev, const RealVector &beta_dot, const RealVector &gamma, RealVector &H_raw_mom)

apply matrix control variate parameter (beta) to approximate HF moment

void export_all_samples (String root_prepend, const Model &model, size_t iter, size_t lev)

export allSamples to tagged tabular file

void convert_moments (const RealMatrix &raw_mom, RealMatrix &final_mom)

convert uncentered raw moments (multilevel expectations) to standardized moments

void compute_error_estimates (IntRealMatrixMap &sum_Ql, IntRealMatrixMap &sum_Qlm1, IntIntPairRealMatrixMap &sum_QlQlm1, Sizet2DArray &num_Q)

populate finalStatErrors for MLMC based on Q sums

Real aggregate_variance_Ysum (const Real *sum_Y, const Real *sum YY, const SizetArray &N_l)

sum up variances across QoI (using sum YY with means from sum Y)

Real aggregate_variance_Qsum (const Real *sum_Ql, const Real *sum_Qlm1, const Real *sum_QlQl, const Real *sum_QlQlm1, const Real *sum_Qlm1Qlm1, const SizetArray &N_l, size_t lev)

sum up variances across QoI (using sum_Ql with means from sum_Q)

Real aggregate_mse_Yvar (const Real *var_Y, const SizetArray &N_l)

sum up Monte Carlo estimates for mean squared error (MSE) across QoI using discrepancy variances

Real aggregate_mse_Ysum (const Real *sum_Y, const Real *sum YY, const SizetArray &N_l)

sum up Monte Carlo estimates for mean squared error (MSE) across QoI using discrepancy variances

Real aggregate_mse_Qsum (const Real *sum_Ql, const Real *sum_Qlm1, const Real *sum_QlQl, const Real *sum_QlQlm1, const Real *sum_Qlm1Qlm1, const SizetArray &N_l, size_t lev)

sum up Monte Carlo estimates for mean squared error (MSE) across QoI using discrepancy sums

void uncentered_to_centered (Real rm1, Real rm2, Real rm3, Real rm4, Real &cm1, Real &cm2, Real &cm3, Real &cm4, size_t Nlq) const

convert uncentered (raw) moments to centered moments; biased estimators

void uncentered_to_centered (Real rm1, Real rm2, Real rm3, Real rm4, Real &cm1, Real &cm2, Real &cm3, Real &cm4) const

convert uncentered (raw) moments to centered moments; unbiased estimators

void centered_to_standard (Real cm1, Real cm2, Real cm3, Real cm4, Real &sm1, Real &sm2, Real &sm3, Real &sm4) const
convert centered moments to standardized moments

- void `check_negative` (Real &cm) const
  detect, warn, and repair a negative central moment (for even orders)
- Real `sum` (const Real *vec, size_t vec_len) const
  compute sum of a set of observations
- Real `average` (const Real *vec, size_t vec_len) const
  compute average of a set of observations
- Real `average` (const RealVector &vec) const
  compute average of a set of observations
- Real `average` (const SizetArray &sa) const
  compute average of a set of observations

Private Attributes

- Sizet3DArray `NLev`
  total number of successful sample evaluations (excluding faults) for each model form, discretization level, and QoI
- SizetArray `pilotSamples`
  store the pilot samples input specification, prior to run-time invocation of `load_pilot_sample()`
- RealVector `mcMSEIter0`
  mean squared error of mean estimator from pilot sample MC on HF model
- Real `equivHFEvals`
  equivalent number of high fidelity evaluations accumulated using samples across multiple model forms and/or discretization levels
- bool `finalCVRefinement`
  if defined, complete the final CV refinement when terminating MLCV based on maxIterations (the total number of refinements beyond the pilot sample will be one more for CV than for ML). This approach is consistent with normal termination based on $\|1_{\text{norm}}(\text{delta}_N_{hf})\| = 0$.
- bool `exportSampleSets`
  if defined, export each of the sample increments in ML, CV, MLCV using tagged tabular files
- unsigned short `exportSamplesFormat`
  format for exporting sample increments using tagged tabular files

Additional Inherited Members

13.135.1 Detailed Description

Performs Multilevel Monte Carlo sampling for uncertainty quantification.

Multilevel Monte Carlo (MLMC) is a variance-reduction technique that utilizes lower fidelity simulations that have response QoI that are correlated with the high-fidelity response QoI.
13.135. NONDMULTILEVELSAMPLING CLASS REFERENCE

13.135.2 Constructor & Destructor Documentation

NonDMultilevelSampling ( ProblemDescDB & problem_db, Model & model )

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), NonDMultilevelSampling::aggregated_models_mode(), Iterator::iterated-Model, Iterator::maxEvalConcurrency, NonDMultilevelSampling::NLev, NonDMultilevelSampling::pilotSamples, NonDSampling::sampleType, Model::subordinate_models(), and Model::surrogate_type().

13.135.3 Member Function Documentation

void pre_run() [protected], [virtual]

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented from NonD.

References NonDMultilevelSampling::NLev, Analyzer::numFunctions, and NonDSampling::pre_run().

void core_run() [protected], [virtual]

The primary run function manages the general case: a hierarchy of model forms (from the ordered model fidelities within a HierarchSurrModel), each of which may contain multiple discretization levels.

Reimplemented from Iterator.

References NonDMultilevelSampling::control_variate_mc(), NonDMultilevelSampling::multilevel_control_variate_MCQcorr(), NonDMultilevelSampling::multilevel_control_variate_MCYcorr(), NonDMultilevelSampling::multilevel_MCQsum(), NonDMultilevelSampling::multilevel_MCYsum(), and NonDMultilevelSampling::NLev.

void post_run ( std::ostream & s ) [protected], [virtual]

post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's post_run(), typically after performing its own implementation steps.

Reimplemented from Analyzer.

References Analyzer::post_run(), and NonDSampling::update_final_statistics().

void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Analyzer.

References NonDMultilevelSampling::equivHFEvals, Iterator::iteratedModel, NonDMultilevelSampling::NLev, NonDSampling::print_moments(), NonD::print_multilevel_evaluation_summary(), Model::response_labels(), NonDSampling::statsFlag, and Model::truth_model().
void multilevel_mc_Ysum ( unsigned short model_form ) [private]

Perform multilevel Monte Carlo across the discretization levels for a particular model form using discrepancy accumulators (sum_Y)

This function performs "geometrical" MLMC on a single model form with multiple discretization levels.
References NonDMultilevelSampling::accumulate_ml_Ysums(), NonDMultilevelSampling::aggregate_mse_Ysum(), NonDMultilevelSampling::aggregate_variance_Ysum(), NonDMultilevelSampling::average(), NonDMultilevelSampling::configure_indices(), Iterator::convergenceTol, NonDMultilevelSampling::convert_moments(), NonDMultilevelSampling::equivHFEvals, Analyzer::evaluate_parameters_sets(), NonDMultilevelSampling::export_all_samples(), NonDMultilevelSampling::exportSampleSets, NonDSampling::get_parameters_sets(), NonDMultilevelSampling::initialize_ml_Ysums(), Iterator::iteratedModel, NonD::load_pilot_sample(), Iterator::maxIterations, NonD::momentStats, NonDMultilevelSampling::NLev, Analyzer::numFunctions, NonDSampling::numSamples, NonD::one_sided_delta(), Iterator::outputLevel, NonDMultilevelSampling::pilotSamples, Model::solution_level_costs(), Model::solution_levels(), Model::surrogate_model_key(), Model::truth_model(), and Model::truth_model_key().
Referenced by NonDMultilevelSampling::core_run().

void multilevel_mc_Qsum ( unsigned short model_form ) [private]

Perform multilevel Monte Carlo across the discretization levels for a particular model form using QoI accumulators (sum_Q)

This function performs "geometrical" MLMC on a single model form with multiple discretization levels.
References NonDMultilevelSampling::accumulate_ml_Qsums(), NonDMultilevelSampling::aggregate_mse_Qsum(), NonDMultilevelSampling::aggregate_variance_Qsum(), NonDMultilevelSampling::average(), NonDMultilevelSampling::centered_to_standard(), NonDMultilevelSampling::check_negative(), NonDMultilevelSampling::compute_error_estimates(), Iterator::convergenceTol, NonDMultilevelSampling::equivHFEvals, Analyzer::evaluate_parameters_sets(), NonDMultilevelSampling::export_all_samples(), NonDMultilevelSampling::exportSampleSets, NonD::finalMomentsType, NonDSampling::get_parameters_sets(), NonDMultilevelSampling::lf_increment(), NonD::load_pilot_sample(), Iterator::maxIterations, NonD::momentStats, NonDMultilevelSampling::NLev, Analyzer::numFunctions, NonDSampling::numSamples, NonD::one_sided_delta(), Iterator::outputLevel, NonDMultilevelSampling::pilotSamples, Model::solution_level_costs(), Model::solution_levels(), Model::surrogate_model_key(), Model::truth_model(), Model::truth_model_key(), and NonDMultilevelSampling::uncentered_to_centered().
Referenced by NonDMultilevelSampling::core_run().

void control_variate_mc ( const UShortArray & lf_key, const UShortArray & hf_key ) [private]

Perform control variate Monte Carlo across two model forms.

This function performs control variate MC across two combinations of model form and discretization level.
References NonDMultilevelSampling::accumulate_cv_sums(), Iterator::convergenceTol, NonDMultilevelSampling::convert_moments(), NonDMultilevelSampling::cv_raw_moments(), NonDMultilevelSampling::equivHFEvals, NonDMultilevelSampling::eval_ratio(), NonDMultilevelSampling::initialize_cv_sums(), Iterator::iteratedModel, NonDMultilevelSampling::lf_increment(), NonD::load_pilot_sample(), Iterator::maxIterations, NonD::momentStats, NonDMultilevelSampling::MSE_ratio(), NonDMultilevelSampling::NLev, Analyzer::numFunctions, NonDSampling::numSamples, NonDMultilevelSampling::pilotSamples, NonDMultilevelSampling::shared_increment(), Model::solution_level_cost(), Model::surrogate_model(), Model::surrogate_model_key(), Model::truth_model(), Model::truth_model_key(), and NonDMultilevelSampling::uncorrected_surrogate_mode().
Referenced by NonDMultilevelSampling::core_run().
void multilevel_control_variate_mc_Ycorr ( unsigned short lf_model_form, unsigned short hf_model_form ) [private]
Perform multilevel Monte Carlo across levels in combination with control variate Monte Carlo across model forms at each level; CV computes correlations for Y (LH correlations for level discrepancies)
This function performs "geometrical" MLMC across discretization levels for the high fidelity model form where CVMC is employed across two model forms to exploit correlation in the discrepancies at each level (Y,). References NonDMultilevelSampling::accumulate_ml_Ysums(), NonDMultilevelSampling::accumulate_mlcv_Ysums(), NonDMultilevelSampling::aggregate_mse_Ysum(), NonDMultilevelSampling::aggregate_mse_Yvar(), NonDMultilevelSampling::aggregate_variance_Ysum(), Analyzer::allResponses, NonDMultilevelSampling::average(), NonDMultilevelSampling::configure_indices(), Iterator::convergenceTol, NonDMultilevelSampling::convert_moments(), NonDMultilevelSampling::cv_raw_moments(), NonDMultilevelSampling::equivHFEvals, NonDMultilevelSampling::eval_ratio(), Analyzer::evaluate_parameter_sets(), NonDMultilevelSampling::export_all_samples(), NonDMultilevelSampling::exportSampleSets, NonDMultilevelSampling::get_parameter_sets(), NonDMultilevelSampling::initialize_mlcv_sums(), Iterator::iteratedModel, NonDMultilevelSampling::lf_increment(), NonD::load_pilot_sample(), Iterator::maxIterations, NonD::momentStats, NonDMultilevelSampling::NLev, Analyzer::numFunctions, NonDSampling::numSamples, NonD::one_sided_delta(), Iterator::outputLevel, NonDMultilevelSampling::pilotSamples, Model::solution_level_costs(), Model::solution_levels(), NonDMultilevelSampling::sum(), Model::surrogate_model(), Model::surrogate_model_key(), Model::truth_model(), and Model::truth_model_key(). Referenced by NonDMultilevelSampling::core_run().

void multilevel_control_variate_mc_Qcorr ( unsigned short lf_model_form, unsigned short hf_model_form ) [private]
Perform multilevel Monte Carlo across levels in combination with control variate Monte Carlo across model forms at each level; CV computes correlations for Q (LH correlations for QoI)
This function performs "geometrical" MLMC across discretization levels for the high fidelity model form where CVMC is employed across two model forms. It generalizes the Y, correlation case to separately target correlations for each QoI level embedded within the level discrepancies. References NonDMultilevelSampling::accumulate_ml_Ysums(), NonDMultilevelSampling::accumulate_mlcv_Qsums(), NonDMultilevelSampling::aggregate_mse_Ysum(), NonDMultilevelSampling::aggregate_mse_Yvar(), NonDMultilevelSampling::aggregate_variance_Ysum(), Analyzer::allResponses, NonDMultilevelSampling::average(), NonDMultilevelSampling::configure_indices(), Iterator::convergenceTol, NonDMultilevelSampling::convert_moments(), NonDMultilevelSampling::cv_raw_moments(), NonDMultilevelSampling::equivHFEvals, NonDMultilevelSampling::eval_ratio(), Analyzer::evaluate_parameter_sets(), NonDMultilevelSampling::export_all_samples(), NonDMultilevelSampling::exportSampleSets, NonDMultilevelSampling::get_parameter_sets(), NonDMultilevelSampling::initialize_mlcv_sums(), Iterator::iteratedModel, NonDMultilevelSampling::lf_increment(), NonD::load_pilot_sample(), Iterator::maxIterations, NonD::momentStats, NonDMultilevelSampling::NLev, Analyzer::numFunctions, NonDSampling::numSamples, NonD::one_sided_delta(), Iterator::outputLevel, NonDMultilevelSampling::pilotSamples, Model::solution_level_costs(), Model::solution_levels(), NonDMultilevelSampling::sum(), Model::surrogate_model(), Model::surrogate_model_key(), Model::truth_model(), and Model::truth_model_key(). Referenced by NonDMultilevelSampling::core_run().

void uncentered_to_centered ( Real rm1, Real rm2, Real rm3, Real rm4, Real & cm1, Real & cm2, Real & cm3, Real & cm4, size_t Nlq ) const [inline], [private]
convert uncentered (raw) moments to centered moments; biased estimators For single-level moment calculations with a scalar Nlq. References by NonDMultilevelSampling::compute_error_estimates(), NonDMultilevelSampling::convert_moments(), and NonDMultilevelSampling::multilevel_mc_Qsum().
void uncentered_to_centered ( Real rm1, Real rm2, Real rm3, Real rm4, Real &cm1, Real &cm2, Real &cm3, Real &cm4 ) const [inline], [private]

convert uncentered (raw) moments to centered moments; unbiased estimators
For single-level moment calculations with a scalar Nlq.

#### Public Member Functions

- **NonDMultilevelStochCollocation** (ProblemDescDB &problem_db, Model &model)
  
  **standard constructor**
  
- **NonDMultilevelStochCollocation** (Model &model, short exp_coeffs_approach, const UShortArray &num_int_seq, const RealVector &dim_pref, short u_space_type, bool piecewise_basis, bool use_derivs)

  **alternate constructor**

- **~NonDMultilevelStochCollocation** ()

  **destructor**

- **bool resize ()**

  reinitializes iterator based on new variable size

#### Protected Member Functions

- **void initialize_u_space_model ()**

  initialize uSpaceModel polynomial approximations with PCE/SC data

- **void core_run ()**
perform a forward uncertainty propagation using PCE/SC methods

- void `assign_specification_sequence()`
  assign the current values from the input specification sequence

- void `increment_specification_sequence()`
  increment the input specification sequence and assign values

- void `print_results` (std::ostream &s, short results_state=FINAL_RESULTS)
  print the final statistics

Private Member Functions

- void `assign_discrepancy_mode()`
  verify supported and define default discrepancy emulation mode

- void `assign_hierarchical_response_mode()`
  define the surrogate response mode for a hierarchical model in multilevel/multifidelity expansions

Private Attributes

- short `mlmfAllocControl`
  type of sample allocation scheme for discretization levels / model forms within multilevel / multifidelity methods

- UShortArray `quadOrderSeqSpec`
  user request of quadrature order

- UShortArray `ssgLevelSeqSpec`
  user request of sparse grid level

- size_t `sequenceIndex`
  sequence index for quadOrderSeqSpec and ssgLevelSeqSpec

Additional Inherited Members

13.136.1 Detailed Description

Nonintrusive stochastic collocation approaches to uncertainty quantification.

The `NonDMultilevelStochCollocation` class uses a stochastic collocation (SC) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the InterpPolyApproximation class to manage multidimensional Lagrange polynomial interpolants.

13.136.2 Constructor & Destructor Documentation

`NonDMultilevelStochCollocation ( ProblemDescDB & problem_db, Model & model )`

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation using the `ProblemDescDB`.

References `Response::active_set()`, `NonDMultilevelStochCollocation::assign_discrepancy_mode()`, `NonDMultilevelStochCollocation::assign_hierarchical_response_mode()`, `Model::assign_rep()`, `ParallelLibrary::command_line_check()`,
NonDStochCollocation::config_approximation_type(), NonDStochCollocation::config_integration(), NonDExpansion::construct_expansion_sampler(), Model::current_response(), ProblemDescDB::get_bool(), ProblemDescDB::get_rv(), ProblemDescDB::get_short(), ProblemDescDB::get_string(), ProblemDescDB::get_ushort(), NonDExpansion::initialize_random(), NonDMultilevelStochCollocation::initialize_u_space_model(), Iterator::iteratedModel, NonDExpansion::numSamplesOnModel, Iterator::outputLevel, Iterator::parallelLib, Iterator::probDescDB, NonDMultilevelStochCollocation::quadOrderSeqSpec, ActiveSet::request_values(), NonDStochCollocation::resolve_inputs(), NonDMultilevelStochCollocation::sequenceIndex, NonDMultilevelStochCollocation::ssgLevelSeqSpec, NonD::transform_model(), and NonDExpansion::uSpaceModel.

NonDMultilevelStochCollocation ( Model & model, short exp_coeffs_approach, const UShortArray & num_int_seq, const RealVector & dim_pref, short u_space_type, bool piecewise_basis, bool use_derivs )

alternate constructor
This constructor is used for helper iterator instantiation on the fly.

References Response::active_set(), NonDMultilevelStochCollocation::assign_discrepancy_mode(), NonDMultilevelStochCollocation::assign_hierarchical_response_mode(), Model::assign_rep(), NonDStochCollocation::config_approximation_type(), NonDStochCollocation::config_integration(), Model::current_response(), NonDExpansion::expansionCoeffsApproach, NonDExpansion::initialize_random(), NonDMultilevelStochCollocation::initialize_u_space_model(), Iterator::iteratedModel, Iterator::outputLevel, NonDMultilevelStochCollocation::quadOrderSeqSpec, ActiveSet::request_values(), NonDStochCollocation::resolve_inputs(), NonDMultilevelStochCollocation::sequenceIndex, NonDMultilevelStochCollocation::ssgLevelSeqSpec, NonD::transform_model(), and NonDExpansion::uSpaceModel.

13.136.3 Member Function Documentation

void increment_specification_sequence ( ) [protected], [virtual]

increment the input specification sequence and assign values

Default implementation redefined by Multilevel derived classes.
Reimplemented from NonDExpansion.

13.137.1 Detailed Description

Base class for POF Dart methods within DAKOTA/UQ.

The NonDPOFDart class implements the calculation of a failure probability for a specified threshold for a specified response function using the concepts developed by Mohamed Ebeida. The approach works by throwing down a number of Poisson disk samples of varying radii, and identifying each disk as either in the failure or safe region. The center of each disk represents a "true" function evaluation. kd-darts are used to place additional points, in such a way to target the failure region. When the disks cover the space sufficiently, Monte Carlo methods or a box volume approach is used to calculate both the lower and upper bounds on the failure probability.

The documentation for this class was generated from the following files:

- NonDPOFDarts.hpp
- NonDPOFDarts.cpp

13.138 NonDPolynomialChaos Class Reference

Nonintrusive polynomial chaos expansion approaches to uncertainty quantification.

Inheritance diagram for NonDPolynomialChaos:
Public Member Functions

- `NonDPolynomialChaos (ProblemDescDB &problem_db, Model &model)`
  standard constructor
- `NonDPolynomialChaos (Model &model, short exp_coeffs_approach, unsigned short num_int, const RealVector &dim_pref, short u_space_type, bool piecewise_basis, bool use_derivs)`
  alternate constructor for numerical integration (tensor, sparse, cubature)
- `NonDPolynomialChaos (Model &model, short exp_coeffs_approach, unsigned short exp_order, const RealVector &dim_pref, size_t colloc_pts, Real colloc_ratio, int seed, short u_space_type, bool piecewise_basis, bool use_derivs, bool cv_flag, const String &import_build_pts_file, unsigned short import_build_format, bool import_build_active_only)`
  alternate constructor for regression (least squares, CS, OLI)

  configure u_space_sampler and approx_type based on regression specification
- int terms_ratio_to_samples (size_t num_exp_terms, Real colloc_ratio)
  convert number of expansion terms and collocation ratio to a number of collocation samples
- Real terms_samples_to_ratio (size_t num_exp_terms, int samples)
  convert number of expansion terms and number of collocation samples to a collocation ratio
- void ratio_samples_to_order (Real colloc_ratio, int num_samples, UShortArray &exp_order, bool less_than_or_equal)
  convert collocation ratio and number of samples to expansion order

Protected Attributes

- short uSpaceType
  user requested expansion type
- unsigned short cubIntSpec
  cubature integrand
- RealVector dimPrefSpec
  user specification for dimension_preference
• Real collocRatio
  
  factor applied to terms’ termsOrder in computing number of regression points, either user specified or inferred
• bool tensorRegression
  
  option for regression PCE using a filtered set tensor-product points
• bool crossValidation
  
  flag for use of cross-validation for selection of parameter settings in regression approaches
• bool crossValidNoiseOnly
  
  flag to restrict cross-validation to only estimate the noise tolerance in order to manage computational cost
• String importBuildPointsFile
  
  user specified import build points file
• unsigned short importBuildFormat
  
  user specified import build file format
• bool importBuildActiveOnly
  
  user specified import build active only
• String importApproxPointsFile
  
  user specified import approx. points file
• unsigned short importApproxFormat
  
  user specified import approx. file format
• bool importApproxActiveOnly
  
  user specified import approx. active only
• String expansionImportFile
  
  filename for import of chaos coefficients
• String expansionExportFile
  
  filename for export of chaos coefficients

Private Member Functions

• void increment_grid_from_order ()
  
  define a grid increment that is consistent with an advancement in expansion order
• void decrement_grid_from_order ()
  
  revert a previous grid increment following an order decrement
• void increment_order_from_grid ()
  
  define an expansion order that is consistent with an advancement in structured/unstructured grid level/density
• void update_samples_from_order ()
  
  update numSamplesOnModel after an order increment/decrement
• void update_model_from_samples ()
  
  publish numSamplesOnModel update to the DataFitSurrModel instance
• void order_to_dim_preference (const UShortArray &order, unsigned short &p, RealVector &dim_pref)
  
  convert an isotropic/anisotropic expansion order vector into a scalar plus a dimension preference vector
Private Attributes

- Real termsOrder
  exponent applied to number of expansion terms for computing number of regression points
- int randomSeed
  seed for random number generator used for regression with LHS and sub-sampled tensor grids
- RealVector noiseTols
  noise tolerance for compressive sensing algorithms; vector form used in cross-validation
- Real l2Penalty
  L2 penalty for LASSO algorithm (elastic net variant)
- unsigned short numAdvance
  number of frontier expansions per iteration with the ADAPTED BASIS EXPANDING FRONT approach
- unsigned short expOrderSpec
  user specification for expansion_order (array for multifidelity)
- size_t collocPtsSpec
  user specification for collocation_points (array for multifidelity)
- size_t expSamplesSpec
  user specification for expansion_samples (array for multifidelity)
- unsigned short quadOrderSpec
  user request of quadrature order
- unsigned short ssgLevelSpec
  user request of sparse grid level
- RealMatrix pceGradsMeanX
  derivative of the PCE with respect to the x-space variables evaluated at the means (used as uncertainty importance metrics)
- bool normalizedCoeffOutput
  user request for use of normalization when outputting PCE coefficients

Additional Inherited Members

13.138.1 Detailed Description

Nonintrusive polynomial chaos expansion approaches to uncertainty quantification.

The NonDPolynomialChaos class uses a polynomial chaos expansion (PCE) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the OrthogPolyApproximation class to manage multiple types of orthogonal polynomials within a Wiener-Askey scheme to PCE. It supports PCE coefficient estimation via sampling, quadrature, point-collocation, and file import.

13.138.2 Constructor & Destructor Documentation

NonDPolynomialChaos ( ProblemDescDB & problem_db, Model & model )

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation using the ProblemDescDB.
References Dakota::abort_handler(), Response::active_set(), Model::assign_rep(), NonDExpansion::check_dimension_preference(), NonDPolynomialChaos::collocPtsSpec, ParallelLibrary::command_line_check(), NonDPolynomialChaos::config_expansion_orders(), NonDPolynomialChaos::config_expectation(), NonDPolynomialChaos::config_integration(), NonDPolynomialChaos::config_regression(), NonDExpansion::construct_expansion_sampler(), NonDPolynomialChaos::cubeIntSpec, Model::current_response(), NonDPolynomialChaos::dimPrefSpec, NonDPolynomialChaos::expansionImportFile, NonDPolynomialChaos::expOrderSpec, NonDPolynomialChaos::expSamplesSpec, ProblemDescDB::get_real(), ProblemDescDB::get_short(), ProblemDescDB::get_string(), ProblemDescDB::get_usa(), ProblemDescDB::get_ushort(), NonDPolynomialChaos::importApproxActiveOnly, NonDPolynomialChaos::importApproxPointsFile, NonDPolynomialChaos::importBuildActiveOnly, NonDPolynomialChaos::importBuildFormat, NonDPolynomialChaos::importBuildPointsFile, NonDExpansion::initialize_random(), NonDPolynomialChaos::initialize_u_space_model(), Iterator::iteratedModel, NonDExpansion::numSamplesOnModel, Iterator::outputLevel, Iterator::parallelLib, Iterator::probDescDB, NonDPolynomialChaos::quadOrderSpec, ActiveSet::request_values(), NonDPolynomialChaos::resolve_inputs(), NonDPolynomialChaos::ssgLevelSpec, NonD::transform_model(), NonDExpansion::uSpaceModel, and NonDPolynomialChaos::uSpaceType.

**Additional Inherited Members**

**13.139.1 Detailed Description**

Derived nondeterministic class that generates N-dimensional numerical quadrature points for evaluation of expectation integrals over uncorrelated standard normals/uniforms/exponentials/betas/gammas.

This class is used by NonDPolynomialChaos, but could also be used for general numerical integration of moments. It employs Gauss-Hermite, Gauss-Legendre, Gauss-Laguerre, Gauss-Jacobi and generalized Gauss-Laguerre quadrature for use with normal, uniform, exponential, beta, and gamma density functions and integration bounds. The abscissas and weights for one-dimensional integration are extracted from the appropriate Orthogonal-Polynomial class and are extended to n-dimensions using a tensor product approach.

References Iterator::maxEvalConcurrency, NonDQuadrature::nestedRules, Analyzer::numContinuousVars, NonDQuadrature::numSamples, NonDQuadrature::quadMode, NonDQuadrature::reset(), NonDQuadrature::tpqDriver, and NonDQuadrature::update().
void sampling_reset ( int min_samples, bool all_data_flag, bool stats_flag ) [protected], [virtual]

used by DataFitSurrModel::build_global() to publish the minimum number of points needed from the quadrature routine in order to build a particular global approximation.

Reimplemented from Iterator.

References NonDIntegration::dimPrefSpec, NonDQuadrature::increment_grid(), NonDQuadrature::increment_grid_preference(), and NonDQuadrature::tpqDriver.

Referenced by NonDQuadrature::update().

int num_samples ( ) const [inline], [protected], [virtual]

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Analyzer.

References NonDQuadrature::numSamples, NonDQuadrature::quadMode, and NonDQuadrature::tpqDriver.

The documentation for this class was generated from the following files:

- NonDQuadrature.hpp
- NonDQuadrature.cpp

13.140 NonDQUESOBayesCalibration Class Reference

Bayesian inference using the QUESO library from UT Austin.

```

Public Member Functions

- NonDQUESOBayesCalibration (ProblemDescDB &problem_db, Model &model)
  
  **standard constructor**

- ~NonDQUESOBayesCalibration ()
  
  **destructor**
Protected Member Functions

- void `calibrate()`
- void `print_results` (std::ostream &s, short results_state=FINAL_RESULTS) 
  
  print the final iteration results
- void `print_variables` (std::ostream &s, const RealVector &c_vars)
  
  convenience function to print calibration parameters, e.g., for MAP / best parameters
- void `init_queso_environment` ()
  
  initialize the QUESO FullEnvironment on the Dakota MPIComm
- void `init_precond_request_value` ()
  
  initialize the ASV value for preconditioned cases
- virtual void `init_queso_solver` ()
  
  define solver options, likelihood callback, posterior RV, and inverse problem
- void `precondition_proposal` (unsigned int chain_index)
  
  use derivative information from the emulator to define the proposal covariance (inverse of misfit Hessian)
- void `run_queso_solver` ()
  
  perform the MCMC process
- void `map_pre_solve` ()
- void `run_chain` ()
  
  short term option to restart the MCMC chain with updated proposal density computed from the emulator at a new starting point
- void `cache_chain` ()
  
  cache the chain to acceptanceChain and acceptedFnVals
- void `log_best` ()
  
  log at most batchSize best chain points into bestSamples
- void `filter_chain_by_conditioning` ()
  
  extract batchSize points from the MCMC chain and store final aggregated set within allSamples; unique points with best conditioning are selected, as determined by pivoted LU
- void `best_to_all` ()
  
  copy bestSamples to allSamples to use in surrogate update
- void `update_model` ()
  
  evaluates allSamples on iteratedModel and update the mcmcModel emulator with all\{
  Samples, Responses\}
- Real `assess_emulator_convergence` ()
  
  compute the L2 norm of the change in emulator coefficients
- void `init_parameter_domain` ()
  
  initialize the QUESO parameter space, min, max, initial, and domain
- void `init_proposal_covariance` ()
- void `prior_proposal_covariance` ()
  
  use covariance of prior distribution for setting proposal covariance
- void `user_proposal_covariance` (const String &input_fmt, const RealVector &cov_data, const String &cov_filename)
  
  set proposal covariance from user-provided diagonal or matrix
- void `validate_proposal` ()
- void `set_ip_options` ()
set inverse problem options call IpOptionsValues common to all solvers

- void set_mh_options ()

  set MH-specific inverse problem options call IpMhOptionsValues

- void update_chain_size (unsigned int size)

  update MH-specific inverse problem options call IpMhOptionsValues

- void copy_gsl (const QUESO::GslVector &qv, RealVector &rv)

  local copy data utility from GslVector to RealVector

- void copy_gsl (const RealVector &rv, QUESO::GslVector &qv)

  local copy data utility from RealVector to GslVector

- void copy_gsl_partial (const QUESO::GslVector &qv, RealVector &rv)

  local copy data utility from portion of GslVector to RealVector

- void copy_gsl_partial (const RealVector &rv, QUESO::GslVector &qv, size_t start)

  local copy data utility from RealVector to portion of GslVector

- void copy_gsl (const QUESO::GslVector &qv, RealMatrix &rm, int i)

  local copy data utility from GslVector to column in RealMatrix

- bool equal_gsl (const QUESO::GslVector &qv1, const QUESO::GslVector &qv2)

  equality tester for two GslVectors

Static Protected Member Functions

- static double dakotaLogLikelihood (const QUESO::GslVector &paramValues, const QUESO::GslVector *paramDirection, const void *functionDataPtr, QUESO::GslVector *gradVector, QUESO::GslMatrix *hessianMatrix, QUESO::GslVector *hessianEffect)

  Log Likelihood function for call-back from QUESO to DAKOTA for evaluation.

Protected Attributes

- String mcmcType

  MCMC type ("dram" or "delayed_rejection" or "adaptive_metropolis" or "metropolis_hastings" or "multilevel", within QUESO)

- int propCovUpdatePeriod

  period (number of accepted chain samples) for proposal covariance update

- unsigned int batchSize

  number of points to add to surrogate at each iteration

- short precondRequestValue

  the active set request value to use in proposal preconditioning

- bool logitTransform

  flag indicating user activation of logit transform option

- boost::shared_ptr < QUESO::EnvOptionsValues > envOptionsValues

  options for setting up the QUESO Environment

- boost::shared_ptr < QUESO::FullEnvironment > quoEnv

  top-level QUESO Environment
- boost::shared_ptr
  < QUESO::VectorSpace
  < QUESO::GslVector,
  QUESO::GslMatrix > > paramSpace
  
  QUESO parameter space based on number of calibrated parameters.

- boost::shared_ptr
  < QUESO::BoxSubset
  < QUESO::GslVector,
  QUESO::GslMatrix > > paramDomain
  
  QUESO parameter domain: hypercube based on min/max values.

- boost::shared_ptr
  < QUESO::GslVector > paramInitials
  
  initial parameter values at which to start chain

- boost::shared_ptr
  < QUESO::BaseVectorRV
  < QUESO::GslVector,
  QUESO::GslMatrix > > priorRv
  
  random variable for the prior

- boost::shared_ptr
  < QUESO::GslMatrix > proposalCovMatrix
  
  proposal covariance for DRAM

- double priorPropCovMult
  
  optional multiplier to scale prior-based proposal covariance

- boost::shared_ptr
  < QUESO::SipOptionsValues > calIpOptionsValues
  
  general inverse problem options

- boost::shared_ptr
  < QUESO::MhOptionsValues > calIpMhOptionsValues
  
  MH-specific inverse problem options.

- boost::shared_ptr
  < QUESO::GenericScalarFunction
  < QUESO::GslVector,
  QUESO::GslMatrix > > likelihoodFunctionObj
  
  random variable for the posterior

- boost::shared_ptr
  < QUESO::GenericVectorRV
  < QUESO::GslVector,
  QUESO::GslMatrix > > postRv
  
  random variable for the posterior

- boost::shared_ptr
  < QUESO::StatisticalInverseProblem
  < QUESO::GslVector,
  QUESO::GslMatrix > > inverseProb
  
  QUESO inverse problem solver.

- String advancedOptionsFile
  
  advanced options file name (GPMSA only); settings from this file override any C++ / Dakota input file settings
CHAPTER 13. CLASS DOCUMENTATION

Static Protected Attributes

- static NonDQUESOBayesCalibration * nonDQUESOInstance
  
  Pointer to current class instance for use in static callback functions.

Private Attributes

- RealVectorArray prevCoeffs
  
  cache previous expansion coefficients for assessing convergence of emulator refinement process

- RealVector mapSoln
  
  store MAP estimate for warm-starting pre-solves

Friends

- class DerivInformedPropCovTK< QUESO::GslVector, QUESO::GslMatrix >
  
  Random walk transition kernel needs callback access to QUESO details.

- class DerivInformedPropCovLogitTK< QUESO::GslVector, QUESO::GslMatrix >
  
  Logit random walk transition kernel needs callback access to QUESO details.

Additional Inherited Members

13.140.1 Detailed Description

Bayesian inference using the QUESO library from UT Austin.

This class wraps the Quantification of Uncertainty for Estimation, Simulation, and Optimization (QUESO) library, developed as part of the Predictive Science Academic Alliance Program (PSAAP)-funded Predictive Engineering and Computational Sciences (PECOS) Center at UT Austin.

13.140.2 Constructor & Destructor Documentation

NonDQUESOBayesCalibration( ProblemDescDB & problem db, Model & model )

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set db list nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), NonDBayesCalibration::adaptPosteriorRefine, NonDQUESOBayesCalibration::advancedOptionsFile, NonDQUESOBayesCalibration::batchSize, NonDCalibration::calibrationData, NonDBayesCalibration::chainSamples, NonDBayesCalibration::emulatorType, NonDQUESOBayesCalibration::init_queso_environment(), Iterator::maxIterations, NonDBayesCalibration::obsErrorMultiplierMode, Iterator::outputLevel, NonDQUESOBayesCalibration::priorPropCovMult, NonDQUESOBayesCalibration::propCovUpdatePeriod, and NonDBayesCalibration::proposalCovarType.

13.140.3 Member Function Documentation

void calibrate( ) [protected, [virtual]]

Perform the uncertainty quantification

  Implements NonDBayesCalibration.
void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
print the final iterator results
This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().
Reimplemented from NonDBayesCalibration.
References NonDBayesCalibration::bestSamples, NonDQUESOBayesCalibration::copy_gsl(), NonDQUESOBayesCalibration::copy_gsl_partial(), NonDCalibration::expData, Dakota::HALF_LOG_2PI, ExperimentData::half_log_cov_determinant(), NonDBayesCalibration::log_prior_density(), Model::num_primary_fns(), Analyzer::numContinuousVars, NonDBayesCalibration::obsErrorMultiplierMode, NonDQUESOBayesCalibration::paramSpace, NonDBayesCalibration::print_results(), NonDQUESOBayesCalibration::print_variables(), NonDBayesCalibration::residualModel, and Dakota::write_precision.

void cache_chain ( ) [protected]
cache the chain to acceptanceChain and acceptedFnVals
Populate all of acceptanceChain(num_params, chainSamples) acceptedFnVals(numFunctions, chainSamples)
References Dakota::abort_handler(), NonDBayesCalibration::acceptanceChain, NonDBayesCalibration::acceptanceFns, Response::active_set(), Model::active_variables(), NonDBayesCalibration::chainSamples, Variables::continuous_variables(), Response::copy(), Variables::copy(), NonDQUESOBayesCalibration::copy_gsl_partial(), Model::current_response(), Model::current_variables(), Dakota::data_pairs, Model::evaluate(), Response::function_values(), Model::interface_id(), NonDQUESOBayesCalibration::inverseProb, Dakota::lookup_by_val(), NonDBayesCalibration::mcmcModel, NonDBayesCalibration::mcmcModelHasSurrogate, Model::model_type(), NonD::natafTransform, Analyzer::numContinuousVars, Analyzer::numFunctions, NonDBayesCalibration::numHyperparams, Iterator::outputLevel, NonDQUESOBayesCalibration::postRv, ActiveSet::request_values(), NonDBayesCalibration::standardizedSpace, and ParamResponsePair::variables().
Referenced by NonDQUESOBayesCalibration::run_chain().

void init_parameter_domain ( ) [protected]
initialize the QUESO parameter space, min, max, initial, and domain
Initialize the calibration parameter domain (paramSpace, paramMins/paramMaxs, paramDomain, param-Initials, priorRV)
References Model::continuous_variables(), NonDQUESOBayesCalibration::copy_gsl_partial(), NonDBayesCalibration::emulatorType, NonDBayesCalibration::invGammaDists, NonDBayesCalibration::mcmcModel, NonD::natafTransform, NonDQUESOBayesCalibration::nonDQUESOInstance, Analyzer::numContinuousVars, NonDBayesCalibration::numHyperparams, Iterator::outputLevel, NonDQUESOBayesCalibration::paramDomain, NonDQUESOBayesCalibration::paramInitials, NonDQUESOBayesCalibration::paramSpace, NonDQUESOBayesCalibration::priorRv, NonDQUESOBayesCalibration::quesoEnv, and NonDBayesCalibration::standardizedSpace.
Referenced by NonDQUESOBayesCalibration::calibrate(), and NonDGPMSABayesCalibration::calibrate().
void prior_proposal_covariance ( ) [protected]

use covariance of prior distribution for setting proposal covariance
   Must be called after paramMins/paramMaxs set above
   References NonD::natafTransform, Analyzer::numContinuousVars, Iterator::outputLevel, NonDQUESOBayesCalibration::priorPropCovMult, NonDQUESOBayesCalibration::proposalCovMatrix, and NonDBayesCalibration::standardizedSpace.

void user_proposal_covariance ( const String & input_fmt, const RealVector & cov_data, const String & cov_filename ) [protected]

set proposal covariance from user-provided diagonal or matrix
   This function will convert user-specified cov_type = "diagonal" | "matrix" data from either cov_data or cov_filename and populate a full QUESO::GslMatrix* in proposalCovMatrix with the covariance.
   References Dakota::convert_to_string(), Dakota::length(), Analyzer::numContinuousVars, NonDQUESOBayesCalibration::proposalCovMatrix, Dakota::read_unsized_data(), and NonDBayesCalibration::standardizedSpace.

void set_ip_options ( ) [protected]

set inverse problem options callIpOptionsValues common to all solvers
   set inverse problem options common to all solvers
   References NonDQUESOBayesCalibration::advancedOptionsFile, NonDQUESOBayesCalibration::callIpOptionsValues, Iterator::outputLevel, and NonDQUESOBayesCalibration::quesoEnv.
   Referenced by NonDGPMSABayesCalibration::init_queso_solver(), and NonDQUESOBayesCalibration::init_queso_solver().

13.140.4 Member Data Documentation

bool logitTransform [protected]

flag indicating user activation of logit transform option
   this option is useful for preventing rejection or resampling for out-of-bounds samples by transforming bounded domains to [-inf,inf].
   Referenced by NonDQUESOBayesCalibration::set_mh_options().
   The documentation for this class was generated from the following files:

- NonDQUESOBayesCalibration.hpp
- NonDQUESOBayesCalibration.cpp

13.141 NonDReliability Class Reference

Base class for the reliability methods within DAKOTA/UQ.
   Inheritance diagram for NonDReliability:
Public Member Functions

- `bool resize()`  
  reinitializes iterator based on new variable size

Protected Member Functions

- `NonDReliability (ProblemDescDB &problem_db, Model &model)`  
  constructor
- `~NonDReliability()`  
  destructor
- `void initialize_graphics (int iterator_server_id=1)`  
  initialize graphics customized for reliability methods
- `const Model & algorithm_space_model () const`

Protected Attributes

- `Model uSpaceModel`  
  Model representing the limit state in u-space, after any recastings and data fits.
- `Model mppModel`  
  RecastModel which formulates the optimization subproblem: RIA, PMA, EGO.
- `Iterator mppOptimizer`  
  Iterator which optimizes the mppModel.
- `unsigned short mppSearchType`  
  the MPP search type selection: MV, x/u-space AMV, x/u-space AMV+, x/u-space TANA, x/u-space EGO, or NO_A-PPROX
- `Iterator importanceSampler`  
  importance sampling instance used to compute/refine probabilities
- `unsigned short integrationRefinement`  
  integration refinement type (NO_INT_REFINE, IS, AIS, or MMAIS) provided by refinement specification
- `size_t numRelAnalyses`  
  number of invocations of core.run()
• size_t approxIters
  number of approximation cycles for the current respFnCount/levelCount
• bool approxConverged
  indicates convergence of approximation-based iterations
• int respFnCount
  counter for which response function is being analyzed
• size_t levelCount
  counter for which response/probability level is being analyzed
• size_t statCount
  counter for which final statistic is being computed
• bool pmaMaximizeG
  flag indicating maximization of G(u) within PMA formulation
• Real requestedTargetLevel
  the \{response, reliability, generalized reliability\} level target for the current response function

### Additional Inherited Members

#### 13.141.1 Detailed Description

Base class for the reliability methods within DAKOTA/UQ.

The NonDReliability class provides a base class for NonDLocalReliability, which implements traditional MPP-based reliability methods, and NonDGlobalReliability, which implements global limit state search using Gaussian process models in combination with multimodal importance sampling.

#### 13.141.2 Member Function Documentation

**const Model & algorithm::space_model( ) const [inline], [protected], [virtual]**

default definition that gets redefined in selected derived Minimizers

  Reimplemented from Analyzer.
  References NonDReliability::uSpaceModel.
  The documentation for this class was generated from the following files:

  • NonDReliability.hpp
  • NonDReliability.cpp

### 13.142 NonDRKDDarts Class Reference

Base class for the Recursive k-d Dart methods within DAKOTA/UQ.

Inheritance diagram for NonDRKDDarts:
Public Member Functions

- `NonDRKDDarts (ProblemDescDB &problem_db, Model &model)`

Additional Inherited Members

13.142.1 Detailed Description
Base class for the Recursive k-d Dart methods within DAKOTA/UQ.
The NonDRKDDart class recursively implements the numerical integration of a domain based on k-d flat samples.

13.142.2 Member Function Documentation

void core_run ( ) [virtual]
Loop over the set of samples and compute responses.
Reimplemented from Iterator.

void pre_run ( ) [protected], [virtual]
Generate samples
Generate Parameter Sets.
Reimplemented from NonD.
References NonD::pre_run().

void post_run ( std::ostream & s ) [protected], [virtual]
Generate statistics
Print function evaluation summary, and integration results.
Reimplemented from Analyzer.
References Iterator::iteratedModel, Analyzer::post_run(), and Model::print_evaluation_summary().
The documentation for this class was generated from the following files:

• NonDRKDDarts.hpp
• NonDRKDDarts.cpp

13.143 NonDSampling Class Reference
Base class for common code between NonDLHSSampling, NonDAdaptImpSampling, and other specializations.
Inheritance diagram for NonDSampling:
CHAPTER 13. CLASS DOCUMENTATION

NonDSampling
NonDAnalyzer
NonDIterator
NonDAdaptImpSampling
NonDAdaptiveSampling
NonDGPImpSampling
NonDLHSSampling
NonDMultilevelSampling

Public Member Functions

- **NonDSampling**: `Model &model, const RealMatrix &sample_matrix`  
  alternate constructor for evaluating and computing statistics for the provided set of samples
- **void compute_statistics**: `(const RealMatrix &vars_samples, const IntResponseMap &resp_samples)`  
  For the input sample set, computes mean, standard deviation, and probability/reliability/response levels (aleatory uncertainties) or intervals (epistemic or mixed uncertainties)
- **void compute_intervals**: `(RealRealPairArray &extreme_fns)`  
  called by `compute_statistics()` to calculate min/max intervals using allResponses
- **void compute_intervals**: `(const IntResponseMap &samples)`  
  called by `compute_statistics()` to calculate extremeValues from samples
- **void compute_intervals**: `(RealRealPairArray &extreme_fns, const IntResponseMap &samples)`  
  called by `compute_statistics()` to calculate min/max intervals using samples
- **void compute_moments**: `(const RealVectorArray &fn_samples)`  
  calculates sample moments from a matrix of observations for a set of QoI
- **void compute_moments**: `(const IntResponseMap &samples)`  
  calculate sample moments and confidence intervals from a map of response observations
- **void compute_moments**: `(const IntResponseMap &samples, RealMatrix &moment_stats, RealMatrix &moment_grads, RealMatrix &moment_conf_ints, short moments_type, const StringArray &labels)`  
  convert IntResponseMap to RealVectorArray and invoke helpers
- **void compute_moment_gradients**: `(const RealVectorArray &fn_samples, const RealMatrixArray &grad_samples, const RealMatrix &moment_stats, RealMatrix &moment_grads, short moments_type)`  
  compute moment grads from function and gradient samples
- **void compute_moment_confidence_intervals**: `(const RealMatrix &moment_stats, RealMatrix &moment_conf_ints, const SizetArray &sample_counts, short moments_type)`  
  compute moment confidence intervals from moment values
- **void archive_moments**: `(size_t inc_id=0)`  
  archive moment statistics in results DB
- **void archive_moment_confidence_intervals**: `(size_t inc_id=0)`  
  archive moment confidence intervals in results DB
- **void archive_extreme_responses**: `(size_t inc_id=0)`  
  archive extreme values (epistemic result) in results DB
- **void compute_level_mappings**: `(const IntResponseMap &samples)`  
  called by `compute_statistics()` to calculate CDF/CCDF mappings of z to p/beta and of p/beta to z as well as PDFs
- **void print_statistics**: `(std::ostream &s)` const
prints the statistics computed in `compute_statistics()`

- void `print_intervals` (std::ostream &s) const
  
  prints the intervals computed in `compute_intervals()` with default qoi_type and moment_labels

- void `print_intervals` (std::ostream &s, String qoi_type, const StringArray &interval_labels) const
  
  prints the intervals computed in `compute_intervals()`

- void `print_moments` (std::ostream &s) const
  
  prints the moments computed in `compute_moments()` with default qoi_type and moment_labels

- void `print_moments` (std::ostream &s, String qoi_type, const StringArray &moment_labels) const
  
  prints the moments computed in `compute_moments()`

- void `print_wilks_statistics` (std::ostream &s) const
  
  prints the Wilks statistics

- void `update_final_statistics` ()
  
  update_finalStatistics from minValues/maxValues, momentStats, and computedProbLevels/computedRelLevels/computed-RespLevels

- void `transform_samples` (bool x_to_u=true)
  
  transform allSamples imported by alternate constructor. This is needed since random variable distribution parameters are not updated until run time and an imported sample_matrix is typically in x-space.

- void `transform_samples` (RealMatrix &sample_matrix, bool x_to_u, int num_samples=0)
  
  transform the specified samples matrix from x to u or u to x

Static Public Member Functions

- static void `compute_moments` (const RealVectorArray &fn_samples, SizetArray &sample_counts, RealMatrix &moment_stats, short moments_type, const StringArray &labels)
  
  core `compute_moments()` implementation with all data as inputs

- static void `compute_moments` (const RealVectorArray &fn_samples, RealMatrix &moment_stats, short moments_type)
  
  core `compute_moments()` implementation with all data as inputs

- static void `compute_moments` (const RealMatrix &fn_samples, RealMatrix &moment_stats, short moments_type)
  
  alternate RealMatrix samples API for use by external clients

- static void `print_moments` (std::ostream &s, const RealMatrix &moment_stats, const RealMatrix moment_cis, String qoi_type, short moments_type, const StringArray &moment_labels, bool print_cis)
  
  core print moments that can be called without object

- static int `compute_wilks_sample_size` (unsigned short order, Real alpha, Real beta, bool twosided=false)
  
  calculates the number of samples using the Wilks formula Static so I can test without instantiating a NonDSampling object - RWH

- static Real `compute_wilks_residual` (unsigned short order, int nsamples, Real alpha, Real beta, bool twosided)
  
  Helper function - calculates the Wilks residual.

- static Real `compute_wilks_alpha` (unsigned short order, int nsamples, Real alpha, Real beta, bool twosided=false)
  
  calculates the alpha parameter given number of samples using the Wilks formula Static so I can test without instantiating a NonDSampling object - RWH

- static Real `compute_wilks_beta` (unsigned short order, int nsamples, Real alpha, bool twosided=false)
  
  calculates the beta parameter given number of samples using the Wilks formula Static so I can test without instantiating a NonDSampling object - RWH
• static Real get_wilks_alpha_min ()
  Get the lower and upper bounds supported by Wilks bisection solves.
• static Real get_wilks_alpha_max ()
• static Real get_wilks_beta_min ()
• static Real get_wilks_beta_max ()

Protected Member Functions

• NonDSampling (ProblemDescDB &problem_db, Model &model)
  constructor
• NonDSampling (unsigned short method_name, Model &model, unsigned short sample_type, int samples, int seed, const String &rng, bool vary_pattern, short sampling_vars_mode)
  alternate constructor for sample generation and evaluation "on the fly"
• NonDSampling (unsigned short sample_type, int samples, int seed, const String &rng, const RealVector &lower_bnds, const RealVector &upper_bnds)
  alternate constructor for sample generation "on the fly"
• NonDSampling (unsigned short sample_type, int samples, int seed, const String &rng, const RealVector &means, const RealVector &std_devs, const RealVector &lower_bnds, const RealVector &upper_bnds, RealSymMatrix &correl)
  alternate constructor for sample generation of correlated normals "on the fly"
• ~NonDSampling ()
  destructor
• void pre_run ()
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori
• void core_run ()
• int num_samples () const
• void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)
  resets number of samples and sampling flags
• void sampling_reference (int samples_ref)
  set reference number of samples, which is a lower bound during reset
• unsigned short sampling_scheme () const
  return sampleType
• void vary_pattern (bool pattern_flag)
  set varyPattern
• void get_parameter_sets (Model &model)
  Uses lhsDriver to generate a set of samples from the distributions/bounds defined in the incoming model.
• void get_parameter_sets (Model &model, const int num_samples, RealMatrix &design_matrix)
  Uses lhsDriver to generate a set of samples from the distributions/bounds defined in the incoming model and populates the specified design matrix.
• void get_parameter_sets (Model &model, const int num_samples, RealMatrix &design_matrix, bool write_msg)
  core of get_parameter_sets that accepts message print control
• void get_parameter_sets (const RealVector &lower_bnds, const RealVector &upper_bnds)
  Uses lhsDriver to generate a set of uniform samples over lower_bnds/upper_bnds.
• void **get_parameter_sets** (const RealVector &means, const RealVector &std_devs, const RealVector &lower_bnds, const RealVector &upper_bnds, RealSymMatrix &correl)

  Uses lhsDriver to generate a set of normal samples.

• void **update_model_from_sample** (Model &model, const Real *sample_vars)

  Override default update of continuous vars only.

• void **sample_to_variables** (const Real *sample_vars, Variables &vars)

  override default mapping of continuous variables only

• void **variables_to_sample** (const Variables &vars, Real *sample_vars)

• const RealVector & **response_error_estimates** () const

  return error estimates associated with each of the finalStatistics

• void **initialize_lhs** (bool write_message, int num_samples)

  increments numLHSRuns, sets random seed, and initializes lhsDriver

• void **active_set_mapping** ()

  in the case of sub-iteration, map from finalStatistics.active_set() requests to activeSet used in evaluate_parameter_sets()

• void **view_design_counts** (const Model &model, size_t &num_cdv, size_t &num_ddiv, size_t &num_ddsv, size_t &num_ddrv) const

  compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

• void **view_aleatory_uncertain_counts** (const Model &model, size_t &num_cauv, size_t &num_dauiv, size_t &num_deusv, size_t &num_deurv) const

  compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

• void **view_epistemic_uncertain_counts** (const Model &model, size_t &num_ceuv, size_t &num_deuiv, size_t &num_deusv, size_t &num_derv) const

  compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

• void **view_uncertain_counts** (const Model &model, size_t &num_cuv, size_t &num_duiv, size_t &num_dusv, size_t &num_durv) const

  compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

• void **view_state_counts** (const Model &model, size_t &num_csv, size_t &num_dsv, size_t &num_dsv) const

  compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

• void **mode_counts** (const Model &model, size_t &cv_start, size_t &cv_end, size_t &num_cv, size_t &div_start, size_t &num_div, size_t &dsv_start, size_t &num_dsv, size_t &drv_start, size_t &num_drv) const

  compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

**Static Protected Member Functions**

• static void **accumulate_mean** (const RealVectorArray &fn_samples, size_t q, size_t &num_samp, Real &mean)

  helper to accumulate sum of finite samples

• static void **accumulate_moments** (const RealVectorArray &fn_samples, size_t q, short moments_type, Real *moments)
CHAPTER 13. CLASS DOCUMENTATION

helper to accumulate higher order sums of finite samples

- static void accumulate_moment_gradients (const RealVectorArray &fn_samples, const RealMatrixArray &grad_samples, size_t q, short moments_type, Real mean, Real mom2, Real *mean_grad, Real *mom2_grad)
  helper to accumulate gradient sums

Protected Attributes

- const int seedSpec
  the user seed specification (default is 0)
- int randomSeed
  the current seed
- const int samplesSpec
  initial specification of number of samples
- int samplesRef
  reference number of samples updated for refinement
- int numSamples
  the current number of samples to evaluate
- String rngName
  name of the random number generator
- unsigned short sampleType
  the sample type: default, random, lhs, incremental random, or incremental lhs
- bool wilksFlag
  flags use of Wilks formula to calculate num samples
- unsigned short wilksOrder
- Real wilksAlpha
- Real wilksBeta
- short wilksSidedness
- RealMatrix momentGrads
  gradients of standardized or central moments of response functions, as determined by finalMomentsType. Calculated in compute_moments() and indexed as (var,moment) when moment id runs from 1:2*numFunctions.
- RealVector finalStatErrors
  standard errors (estimator std deviation) for each of the finalStatistics
- int samplesIncrement
  current increment in a sequence of samples
- Pecos::LHSDriver lhsDriver
  the C++ wrapper for the F90 LHS library
- bool statsFlag
  flags computation/output of statistics
- bool allDataFlag
  flags update of allResponses < (allVariables or allSamples already defined)
- short samplingVarsMode
the sampling mode: ALEATORY,UNCERTAIN, UNIFORM, EPISTEMIC, UNCERTAIN, UNIFORM, ACTIVE, UNIFORM, or ALL, UNIFORM. This is a secondary control on top of the variables view that allows sampling over subsets of variables that may differ from the view.

- short `sampleRanksMode` mode for input/output of LHS sample ranks: IGNORE_RANKS, GET_RANKS, SET_RANKS, or SET_GET_RANKS
- bool `varyPattern` flag for generating a sequence of seed values within multiple `get_parameter_sets()` calls so that these executions (e.g., for SBO/SBNLS) are not repeated, but are still repeatable
- RealMatrix `sampleRanks` data structure to hold the sample ranks
- SensAnalysisGlobal `nonDSampCorr` initialize statistical post processing
- bool `backfillFlag` flags whether to use backfill to enforce uniqueness of discrete LHS samples
- RealRealPairArray `extremeValues` Minimum and maximum values of response functions for epistemic calculations (calculated in `compute_intervals()`).
- bool `functionMomentsComputed` Function moments have been computed; used to determine whether to archive the moments.

### Private Attributes

- size_t `numLHSRuns` counter for number of executions of `get_parameter_sets()` for this object
- RealMatrix `momentCIs` Matrix of confidence internals on moments, with rows for mean_lower, mean_upper, sd_lower, sd_upper (calculated in `compute_moments()`)

### Additional Inherited Members

#### 13.143.2 Constructor & Destructor Documentation

**NonDSampling ( Model & model, const RealMatrix & sample_matrix )**

alternate constructor for evaluating and computing statistics for the provided set of samples

This alternate constructor defines allSamples from an incoming sample matrix.

References Analyzer::allSamples, Analyzer::compactMode, Iterator::maxEvalConcurrency, NonDSampling::numSamples, NonDSampling::samplesRef, NonDSampling::samplesSpec, and Iterator::subIteratorFlag.
NonDSampling ( ProblemDescDB & problem_db, Model & model ) [protected]

constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification.

References Dakota::abort_handler(), NonDSampling::compute_wilks_sample_size(), NonD::epistemicStats, ProblemDescDB::get_real(), ProblemDescDB::get_short(), ProblemDescDB::get_ushort(), NonD::initialize_final_statistics(), Iterator::maxEvalConcurrency, Analyzer::numFunctions, NonDSampling::numSamples, Iterator::probDescDB, NonD::requestedProbLevels, NonDSampling::samplesRef, NonDSampling::sampleType, NonD::totalLevelRequests, and NonDSampling::wilksFlag.

NonDSampling ( unsigned short method_name, Model & model, unsigned short sample_type, int seed, const String & rng, bool vary_pattern, short sampling_vars_mode ) [protected]

alternate constructor for sample generation and evaluation "on the fly"

This alternate constructor is used for generation and evaluation of on-the-fly sample sets.

References NonD::epistemicStats, Iterator::maxEvalConcurrency, NonD::numEpistemicUncVars, NonDSampling::numSamples, NonDSampling::sampleType, NonDSampling::samplingVarsMode, and Iterator::subIteratorFlag.

NonDSampling ( unsigned short sample_type, int samples, int seed, const String & rng, const RealVector & lower_bnds, const RealVector & upper_bnds ) [protected]

alternate constructor for sample generation "on the fly"

This alternate constructor is used by ConcurrentStrategy for generation of uniform, uncorrelated sample sets.

References Iterator::maxEvalConcurrency, NonDSampling::numSamples, NonDSampling::sampleType, and Iterator::subIteratorFlag.

NonDSampling ( unsigned short sample_type, int samples, int seed, const String & rng, const RealVector & means, const RealVector & std_devs, const RealVector & lower_bnds, const RealVector & upper_bnds, RealSymMatrix & correl ) [protected]

alternate constructor for sample generation of correlated normals "on the fly"

This alternate constructor is used by ConcurrentStrategy for generation of normal, correlated sample sets.

References Iterator::maxEvalConcurrency, NonDSampling::numSamples, NonDSampling::sampleType, and Iterator::subIteratorFlag.

13.143.3 Member Function Documentation

void compute_level_mappings ( const IntResponseMap & samples )

called by compute_statistics() to calculate CDF/CCDF mappings of z to p/beta and of p/beta to z as well as PDFs

Computes CDF/CCDF based on sample binning. A PDF is inferred from a CDF/CCDF within compute_densities() after level computation.

References Dakota::abort_handler(), Response::active_set_derivative_vector(), Response::active_set_request_vector(), NonD::archive_allocate_mappings(), NonD::cdfFlag, NonD::compute_densities(), NonD::computedGenRelLevels, NonD::computedProbLevels, NonD::computedRelLevels, NonD::computedRespLevels, NonDSampling::extremeValues, NonD::finalMomentsType, NonD::finalStatistics, Response::function_gradient_view(), NonD::initialize_level_mappings(), Iterator::iteratedModel, NonDSampling::momentGrads, NonD::momentStats, Analyzer::numFunctions, NonD::pdfOutput, NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonD::respLevelTarget, and Model::response_labels().

Referenced by NonDSampling::compute_statistics(), and NonDExpansion::run_sampler().
13.143. NONDSAMPLING CLASS REFERENCE

**void transform_samples ( bool xJoU = true ) [inline]**

transform allSamples imported by alternate constructor. This is needed since random variable distribution parameters are not updated until run time and an imported sample matrix is typically in x-space.

transform x_samples to u_samples for use by expansionSampler

References Analyzer::allSamples, and NonDSampling::numSamples.

Referenced by NonDLHSSampling::d_optimal_parameter_set(), and NonDExpansion::initialize_expansion().

**void pre_run( ) [inline], [protected], [virtual]**

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's `pre_run()`, if implemented, typically before performing its own implementation steps.

Reimplemented from NonD.

References NonDSampling::active_set_mapping(), NonD::pre_run(), and Iterator::subIteratorFlag.

Referenced by NonDMultilevelSampling::pre_run(), and NonDLHSSampling::pre_run().

**void core_run( ) [protected], [virtual]**

Default implementation generates allResponses from either allSamples or allVariables.

Reimplemented from NonD.

References NonDSampling::allDataFlag, Analyzer::evaluate_parameter_sets(), Iterator::iteratedModel, and NonDSampling::statsFlag.

**int num_samples ( ) const [inline], [protected], [virtual]**

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Analyzer.

References NonDSampling::numSamples, NonDSampling::samplesIncrement, NonDSampling::samplesRef, and NonDSampling::statsFlag.

**void sampling_reset ( int min_samples, bool all_data_flag, bool stats_flag ) [inline], [protected], [virtual]**

resets number of samples and sampling flags

used by DataFitSurrModel::build_global() to publish the minimum number of samples needed from the sampling routine (to build a particular global approximation) and to set allDataFlag and statsFlag. In this case, allDataFlag is set to true (vectors of variable and response sets must be returned to build the global approximation) and statsFlag is set to false (statistics computations are not needed).

Reimplemented from Iterator.

References NonDSampling::allDataFlag, NonDSampling::numSamples, NonDSampling::samplesIncrement, NonDSampling::samplesRef, and NonDSampling::statsFlag.
void get\_parameter\_sets ( Model & model ) [inline], [protected], [virtual]

Uses lhsDriver to generate a set of samples from the distributions/bounds defined in the incoming model.

This version of get\_parameter\_sets() extracts data from the user-defined model in any of the four sampling modes and populates class member allSamples.

Reimplemented from Analyzer.

References Analyzer::allSamples, and NonDSampling::numSamples.

Referenced by NonDLHSSampling::compute\_pca(), NonDAuditImpSampling::core\_run(), NonDLHSSampling::d\_optimal\_parameter\_set(), NonDSampling::get\_parameter\_sets(), NonDLHSSampling::increment\_lhs\_parameter\_set(), NonDLHSSampling::initial\_increment\_lhs\_set(), NonDMultilevelSampling::lf\_increment(), NonDMultilevelSampling::multilevel\_control\_variate\_mc\_Qcorr(), NonDMultilevelSampling::multilevel\_control\_variate\_mc\_Ycorr(), NonDMultilevelSampling::multilevel\_mc\_Qsum(), NonDMultilevelSampling::multilevel\_mc\_Ysum(), NonDLHSSampling::NonDLHSSampling(), NonDLHSSampling::pre\_run(), and NonDMultilevelSampling::shared\_increment().

void get\_parameter\_sets ( Model & model, const int num\_samples, RealMatrix & design\_matrix ) [inline], [protected], [virtual]

Uses lhsDriver to generate a set of samples from the distributions/bounds defined in the incoming model and populates the specified design matrix.

This version of get\_parameter\_sets() extracts data from the user-defined model in any of the four sampling modes and populates the specified design matrix.

Reimplemented from Analyzer.

References NonDSampling::get\_parameter\_sets().

void get\_parameter\_sets ( const RealVector & lower\_bnds, const RealVector & upper\_bnds ) [protected]

Uses lhsDriver to generate a set of uniform samples over lower\_bnds/upper\_bnds.

This version of get\_parameter\_sets() does not extract data from the user-defined model, but instead relies on the incoming bounded region definition. It only support a UNIFORM sampling mode, where the distinction of ACTIVE\_UNIFORM vs. ALL\_UNIFORM is handled elsewhere.

References Analyzer::allSamples, NonDSampling::initialize\_lhs(), NonDSampling::lhsDriver, and NonDSampling::numSamples.

void get\_parameter\_sets ( const RealVector & means, const RealVector & std\_devs, const RealVector & lower\_bnds, const RealVector & upper\_bnds, RealSymMatrix & correl ) [protected]

Uses lhsDriver to generate a set of normal samples.

This version of get\_parameter\_sets() does not extract data from the user-defined model, but instead relies on the incoming definition. It only support the sampling of normal variables.

References Analyzer::allSamples, NonDSampling::initialize\_lhs(), NonDSampling::lhsDriver, and NonDSampling::numSamples.

void variables\_to\_sample ( const Variables & vars, Real * sample\_vars ) [protected], [virtual]

Map the active variables from vars to sample\_vars (column in allSamples)

Reimplemented from Analyzer.

References Variables::continuous\_variables(), Variables::discrete\_int\_variables(), Variables::discrete\_real\_variables(), Model::discrete\_set\_string\_values(), Variables::discrete\_string\_variables(), Iterator::iteratedModel, Analyzer::numContinuous\_Vars, Analyzer::numDiscrete\_Int\_Vars, Analyzer::numDiscrete\_Real\_Vars, Analyzer::numDiscrete\_String\_Vars, Dakota::set\_value\_to\_index(), and Variables::view().
void active_set_mapping() [protected]

in the case of sub-iteration, map from finalStatistics.active_set() requests to activeSet used in evaluate_parameter_sets()

Map ASV/DVV requests in final statistics into activeSet for use in evaluate_parameter_sets()

References Response::active_set_derivative_vector(), Response::active_set_request_vector(), Iterator::activeSet, ActiveSet::derivative_vector(), NonD::finalMomentsType, NonD::finalStatistics, Analyzer::numFunctions, ActiveSet::request_vector(), NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonD::respLevelTarget, and NonD::totalLevelRequests.

Referenced by NonDSampling::pre_run().

void view_design_counts(const Model &model, size_t &num_cdv, size_t &num_ddiv, size_t &num_ddsv, size_t &num_ddrv) const [protected]

compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

This function computes total design variable counts, not active counts, for use in defining offsets and counts within all variables arrays.

References Model::current_variables(), Variables::cv_start(), SharedVariablesData::design_counts(), Variables::div_start(), Variables::drv_start(), Variables::dsv_start(), NonD::numContDesVars, NonD::numDiscIntDesVars, NonD::numDiscRealDesVars, NonD::numDiscStringDesVars, Variables::shared_data(), and Variables::view().

Referenced by NonDSampling::mode_counts().

void view_aleatory_uncertain_counts(const Model &model, size_t &num_cauv, size_t &num_dauiv, size_t &num_dausv, size_t &num_daurv) const [protected]

compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

This function computes total aleatory uncertain variable counts, not active counts, for use in defining offsets and counts within all variables arrays.

References SharedVariablesData::aleatory_uncertain_counts(), Model::current_variables(), NonD::numContAleatUncVars, NonD::numDiscIntAleatUncVars, NonD::numDiscRealAleatUncVars, NonD::numDiscStringAleatUncVars, Variables::shared_data(), and Variables::view().

Referenced by NonDSampling::mode_counts().

void view_epistemic_uncertain_counts(const Model &model, size_t &num_ceuv, size_t &num_deuiv, size_t &num_deusv, size_t &num_deurv) const [protected]

compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model

This function computes total epistemic uncertain variable counts, not active counts, for use in defining offsets and counts within all variables arrays.

References Model::current_variables(), SharedVariablesData::epistemic_uncertain_counts(), NonD::numContEpistUncVars, NonD::numDiscIntEpistUncVars, NonD::numDiscRealEpistUncVars, NonD::numDiscStringEpistUncVars, Variables::shared_data(), and Variables::view().

Referenced by NonDSampling::mode_counts().
void view_uncertain_counts ( const Model & model, size_t & num_cuv, size_t & num_duv, size_t & num_dusv, size_t & num_durv ) const [protected]

compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model.

This function computes total uncertain variable counts, not active counts, for use in defining offsets and counts within all variables arrays.

References Model::current_variables(), Variables::cv(), Variables::dv(), Variables::ds(), NonD::numContAleatUncVars, NonD::numContEpistUncVars, NonD::numDiscIntAleatUncVars, NonD::numDiscIntEpistUncVars, NonD::numDiscRealAleatUncVars, NonD::numDiscRealEpistUncVars, NonD::numDiscStringAleatUncVars, NonD::numDiscStringEpistUncVars, Variables::shared_data(), SharedVariablesData::uncertain_counts(), and Variables::view().

Referenced by NonDSampling::mode_counts().

void mode_counts ( const Model & model, size_t & cv_start, size_t & num_cv, size_t & div_start, size_t & num_div, size_t & dsv_start, size_t & num_dsv, size_t & drv_start, size_t & num_drv ) const [protected]

compute sampled subsets (all, active, uncertain) within all variables (acv/adiv/adrv) from samplingVarsMode and model.

This function and its helpers to follow are needed since NonDSampling supports a richer set of sampling modes than just the active variable subset. mode_counts() manages the samplingVarsMode setting, while its helper functions (view_{design, aleatory_uncertain, epistemic_uncertain, uncertain, state} counts) manage the active variables view. Similar to the computation of starts and counts in creating active variable views, the results of this function are starts and counts for use within model.all∗() set/get functions.

References Model::acv(), Model::adiv(), Model::adr(), Model::adsv(), Model::current_variables(), Variables::cv(), Variables::cv_start(), Variables::div(), Variables::div_start(), Variables::dv(), Variables::dsv(), Variables::dsv_start(), NonDSampling::samplingVarsMode, NonDSampling::view_aleatory_uncertain_counts(), NonDSampling::view_design_counts(), NonDSampling::view_epistemic_uncertain_counts(), and NonDSampling::view_uncertain_counts().

Referenced by NonDLHSSampling::archive_results(), NonDSampling::compute_statistics(), NonDLHSSampling::d_optimal_parameter_set(), NonDSampling::get_parameter_sets(), NonDLHSSampling::post_input(), NonDLHSSampling::pre_run(), NonDSampling::print_statistics(), NonDSampling::sample_to_variables(), and NonDSampling::update_model_from_sample().

Protected Member Functions

- NonDSparseGrid (ProblemDescDB &problem_db, Model &model)
  constructor
- ~NonDSparseGrid ()
  destructor
- void initialize_grid (const std::vector<Pecos::BasisPolynomial> &poly_basis)
  initialize integration grid by drawing from polynomial basis settings
- void get_parameter_sets (Model &model)
  Generate one block of numSamples samples (ndim * num_samples), populating allSamples; ParamStudy is the only class that specializes to use allVariables.

- void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)
- const RealVector & anisotropic_weights () const

Private Attributes

- short ssgDriverType
  type of sparse grid driver: combined, incremental, hierarchical, ...
- Pecos::SparseGridDriver * ssgDriver
  convenience pointer to the numIntDriver representation
- unsigned short ssgLevelSpec
  the user specification for the Smolyak sparse grid level, rendered anisotropic via dimPrefSpec
- unsigned short ssgLevelPrev
  value of ssgDriver->level() prior to increment_grid(), for restoration in decrement_grid() since increment must induce a change in grid size and this adaptive increment in not reversible
Additional Inherited Members

13.144.1 Detailed Description

Derived nondeterministic class that generates N-dimensional Smolyak sparse grids for numerical evaluation of expectation integrals over independent standard random variables.

This class is used by NonDPolynomialChaos and NonDStochCollocation, but could also be used for general numerical integration of moments. It employs 1-D Clenshaw-Curtis and Gaussian quadrature rules within Smolyak sparse grids.

13.144.2 Constructor & Destructor Documentation

NonDSparseGrid ( Model & model, unsigned short ssg_level, const RealVector & dim_pref, short exp_coeffs_soln_approach, short driver_mode, short growth_rate = Pecos::MODERATE_RESTRICTED_GROWTH, short refine_control = Pecos::NO_CONTROL, bool track_uniq_prod_wts = true )

This alternate constructor is used for on-the-fly generation and evaluation of sparse grids within PCE and SC.

References NonDIntegration::numIntDriver, NonDSparseGrid::ssgDriver, and NonDSparseGrid::ssgDriverType.

NonDSparseGrid ( ProblemDescDB & problem_db, Model & model ) [protected]
constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes has been called and probDescDB can be queried for settings from the method specification. It is not currently used, as there is not a separate sparse_grid method specification.

References Model::aleatory_distribution_parameters(), NonDIntegration::check_variables(), Iterator::convergence-Tol, Model::correction_type(), NonDIntegration::dimPrefSpec, ProblemDescDB::get_bool(), ProblemDescDB::get_int(), ProblemDescDB::get_short(), ProblemDescDB::get_ushort(), NonDSparseGrid::initialize_grid(), Iterator::iteratedModel, Iterator::maxEvalConcurrency, NonD::natafTransform, NonDIntegration::numIntDriver, Iterator::outputLevel, Iterator::probDescDB, NonDSparseGrid::ssgDriver, NonDSparseGrid::ssgDriverType, and NonDSparseGrid::ssgLevelSpec.

13.144.3 Member Function Documentation

int num_samples ( ) const [inline], [virtual]
Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Analyzer.

References NonDSparseGrid::ssgDriver.

void sampling_reset ( int min_samples, bool all_data_flag, bool stats_flag ) [protected], [virtual]
used by DataFitSurrModel::build_global() to publish the minimum number of points needed from the sparse grid routine in order to build a particular global approximation.

Reimplemented from Iterator.

References NonDSparseGrid::ssgDriver.

The documentation for this class was generated from the following files:

- NonDSparseGrid.hpp
Nonintrusive stochastic collocation approaches to uncertainty quantification.

- **NonDSStochCollocation** (unsigned short method_name, Model &model, short exp_coeffs_approach, bool piecewise_basis, bool use_derivs)
  short-cut ctor allowing derived class to replace logic in base class ctor
- void **resolve_inputs** (short &u_space_type, short &data_order)
  perform error checks and mode overrides
13.145. NONDSTOCHCOLLOCATION CLASS REFERENCE

- **void initialize_u_space_model ()**
  
  initialize uSpaceModel polynomial approximations with PCE/SC data

- **Real compute_covariance_metric (bool revert, bool print_metric)**
  
  compute 2-norm of change in response covariance

- **Real compute_level_mappings_metric (bool revert, bool print_metric)**
  
  compute 2-norm of change in final statistics

- **void initialize_covariance ()**
  
  initialize covariance pairings by passing all pointers for approximation j to approximation i

- **void compute_delta_mean (bool update_ref)**
  
  helper function to compute deltaRespVariance

- **void compute_delta_variance (bool update_ref, bool print_metric)**
  
  helper function to compute deltaRespVariance

- **void compute_delta_covariance (bool update_ref, bool print_metric)**
  
  helper function to compute deltaRespCovariance

- **void analytic_delta_level_mappings (const RealVector &level_maps_ref, RealVector &level_maps_new)**
  
  update analytic level mappings; this uses a lightweight approach for incremental statistics (no derivatives, no finalStatistics update)

- **void config_integration (unsigned short quad_order, unsigned short ssg_level, const RealVector &dim_pref, short u_space_type, Iterator &u_space_sampler, Model &g_u_model)**
  
  configure u_space_sampler based on numerical integration specification

- **void config_integration (short exp_coeffs_approach, unsigned short num_int, const RealVector &dim_pref, Iterator &u_space_sampler, Model &g_u_model)**
  
  configure u_space_sampler based on expansion coefficients approach

- **void config_approximation_type (String &approx_type)**
  
  define approx_type based on expansion settings

**Private Attributes**

- **RealVector deltaRespMean**
  
  change in response means induced by a refinement candidate

- **RealVector deltaRespVariance**
  
  change in (DIAGONAL) response variance induced by a refinement candidate

- **RealSymMatrix deltaRespCovariance**
  
  change in (FULL) response covariance induced by a refinement candidate

- **RealVector deltaLevelMaps**
  
  change in response means induced by a refinement candidate

**Additional Inherited Members**

13.145.1 Detailed Description

Nonintrusive stochastic collocation approaches to uncertainty quantification.

The **NonDStochCollocation** class uses a stochastic collocation (SC) approach to approximate the effect of parameter uncertainties on response functions of interest. It utilizes the InterpPolyApproximation class to manage multidimensional Lagrange polynomial interpolants.
13.145.2 Constructor & Destructor Documentation

NonDStochCollocation (ProblemDescDB & problem_db, Model & model)

standard constructor

This constructor is called for a standard letter-envelope iterator instantiation using the ProblemDescDB.

References: Response::active_set(), Model::assign_rep(), ParallelLibrary::command_line_check(), NonDStochCollocation::config_approximation_type(), NonDStochCollocation::config_integration(), NonExpansion::construct_expansion_sampler(), Model::current_response(), ProblemDescDB::get_bool(), ProblemDescDB::get_rv(), ProblemDescDB::get_short(), ProblemDescDB::get_string(), ProblemDescDB::get_ushort(), NonExpansion::initialize_random(), NonDStochCollocation::initialize_u_space_model(), Iterator::iteratedModel, NonExpansion::numSamplesOnModel, Iterator::outputLevel, Iterator::parallelLib, Iterator::probDescDB, ActiveSet::request_values(), NonDStochCollocation::resolve_inputs(), NonD::transform_model(), and NonExpansion::uSpaceModel.

NonDStochCollocation (Model & model, short exp_coeffs_approach, unsigned short num_int, const RealVector & dim_pref, short u_space_type, bool piecewise_basis, bool use_derivs)

alternate constructor

This constructor is used for helper iterator instantiation on the fly.

References: Response::active_set(), Model::assign_rep(), NonDStochCollocation::config_approximation_type(), NonDStochCollocation::config_integration(), Model::current_response(), NonExpansion::initialize_random(), NonDStochCollocation::initialize_u_space_model(), Iterator::iteratedModel, Iterator::outputLevel, ActiveSet::request_values(), NonDStochCollocation::resolve_inputs(), NonD::transform_model(), and NonExpansion::uSpaceModel.

NonDStochCollocation (BaseConstructor, ProblemDescDB & problem_db, Model & model)

[protected]

short-cut ctor allowing derived class to replace logic in base class ctor

This constructor is called for a standard letter-envelope iterator instantiation using the ProblemDescDB.

NonDStochCollocation (unsigned short method_name, Model & model, short exp_coeffs_approach, bool piecewise_basis, bool use_derivs)

[protected]

short-cut ctor allowing derived class to replace logic in base class ctor

This constructor is used for helper iterator instantiation on the fly.

13.145.3 Member Function Documentation

Real compute_covariance_metric (bool revert, bool print_metric)

compute 2-norm of change in response covariance

computes the default refinement metric based on change in respCovariance

Reimplemented from NonExpansion.

References: NonExpansion::compute_covariance_metric(), NonDStochCollocation::compute_delta_covariance(), NonDStochCollocation::compute_delta_mean(), NonDStochCollocation::compute_delta_variance(), NonExpansion::covarianceControl, NonDStochCollocation::deltaRespCovariance, NonDStochCollocation::deltaRespVariance, NonExpansion::expansionBasisType, NonExpansion::relativeMetric, NonExpansion::respCovariance, and NonExpansion::respVariance.
Real compute_level_mappings_metric ( bool revert, bool print_metric ) [protected], [virtual]

compute 2-norm of change in final statistics

computes a "goal-oriented" refinement metric employing computed Levels

Reimplemented from NonDExpansion.

References NonDStochCollocation::analytic_delta_level_mappings(), Model::approximations(), NonD::cdfFlag, NonDExpansion::compute_level_mappings_metric(), NonDExpansion::compute_numerical_level_mappings(), PecosApproximation::delta_beta(), PecosApproximation::delta_combined_beta(), PecosApproximation::delta_combined_z(), PecosApproximation::delta_z(), NonDStochCollocation::deltaLevelMaps, PecosApproximation::expansion_coefficient_flag(), NonDExpansion::expansionBasisType, NonDExpansion::initialPtU, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContStateVars, Analyzer::numFunctions, NonD::print_level_mappings(), NonD::pull_level_mappings(), NonD::push_level_mappings(), NonDExpansion::relativeMetric, NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonD::respLevelTarget, NonDExpansion::statsType, NonD::totalLevelRequests, and NonDExpansion::uSpaceModel.

void analytic_delta_level_mappings ( const RealVector & level_maps_ref, RealVector & level_maps_new ) [protected]

update analytic level mappings; this uses a lightweight approach for incremental statistics (no derivatives, no finalStatistics update)

In this function, we leave numerical stats alone, updating analytic level stats either using ref+delta or, if ref is invalid, though recomputation.

References Model::approximations(), PecosApproximation::beta(), NonD::cdfFlag, PecosApproximation::combined_beta(), NonDStochCollocation::deltaLevelMaps, NonDExpansion::initialPtU, NonD::numContDesVars, NonD::numContEpistUncVars, NonD::numContStateVars, Analyzer::numFunctions, NonD::requestedGenRelLevels, NonD::requestedProbLevels, NonD::requestedRelLevels, NonD::requestedRespLevels, NonD::respLevelTarget, NonDExpansion::statsType, NonD::totalLevelRequests, and NonDExpansion::uSpaceModel.

Referenced by NonDStochCollocation::compute_level_mappings_metric().

13.146 NonDWASABIBayesCalibration Class Reference

WASABI - Weighted Adaptive Surrogate Approximations for Bayesian Inference.

Inheritance diagram for NonDWASABIBayesCalibration:
CHAPTER 13. CLASS DOCUMENTATION

NonDWASABIBayesCalibration
NonDBayesCalibration
NonDCalibration
NonD
Analyzer
Iterator

Public Member Functions

- NonDWASABIBayesCalibration (ProblemDescDB &problem_db, Model &model)
  standard constructor
- ~NonDWASABIBayesCalibration ()
  destructor
- void compute_responses (RealMatrix &samples, RealMatrix &responses)

Static Public Member Functions

- static void problem_size (int &chain_num, int &cr_num, int &gen_num, int &pair_num, int &par_num)
  initializer for problem size characteristics in WASABI
- static void problem_value (std::string *chain_filename, std::string *gr_filename, double &gr_threshold, int &jumpstep, double limits[], int par_num, int &printstep, std::string *restart_read_filename, std::string *restart_write_filename)
  Filename and data initializer for WASABI.

Protected Member Functions

- void calibrate ()
- void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  print the final iterator results
- void extract_selected_posterior_samples (const std::vector<int> &points_to_keep, const RealMatrix &samples_for_posterior_eval, const RealVector &posterior_density, RealMatrix &posterior_data) const
  Extract a subset of samples for posterior eval according to the indices in points_to_keep.
- void export_posterior_samples_to_file (const std::string filename, const RealMatrix &posterior_data) const
  Export posterior data to file.
Protected Attributes

- `int numPushforwardSamples`
  
  number of samples from the prior that is pushed forward through the model
- `RealVector dataDistMeans`
  
  The mean of the multivariate Gaussian distribution of the obs. data.
- `RealVector dataDistCovariance`
  
  The covariance of the multivariate Gaussian distribution of the obs. data.
- `std::string dataDistFilename`
  
  The filename of the file containing the data that with density estimator defines the distribution of the obs. data.
- `std::string dataDistCovType`
  
  The type of covariance data provided ("diagonal","matrix")
- `std::string posteriorSamplesImportFile`
  
  The filename of the import file containing samples at which the posterior will be evaluated.
- `unsigned short posteriorSamplesImportFormat`
  
  Format of imported posterior samples file.
- `std::string exportPosteriorDensityFile`
  
  The filename of the export file containing an arbitrary set of samples and their corresponding density values.
- `std::string exportPosteriorSamplesFile`
  
  The filename of the export file containing samples from the posterior and their corresponding density values.
- `unsigned short exportFileFormat`
  
  Format of imported posterior samples and values file.
- `bool generateRandomPosteriorSamples`
  
  Flag specifying whether to generate random samples from the posterior.
- `bool evaluatePosteriorDensity`
  
  Flag specifying whether to evaluate the posterior density at a set of samples.
- `RealVector paramMins`
  
  lower bounds on calibrated parameters
- `RealVector paramMaxs`
  
  upper bounds on calibrated parameters
- `boost::mt19937 mumGenerator`
  
  random number engine for sampling the prior
- `RealMatrix momentStatistics`
  
  Matrix for moment statistics. Note that posterior values have density associated with them so we can’t use the compute moments in NonDSampling.

Additional Inherited Members

13.146.1 Detailed Description

WASABI - Weighted Adaptive Surrogate Approximations for Bayesian Inference.
This class performs Bayesian calibration using the WASABI approach
13.146.2 Constructor & Destructor Documentation

NonDWASABIBayesCalibration ( ProblemDescDB & problem_db, Model & model )
standard constructor

This constructor is called for a standard letter-envelope iterator instantiation. In this case, set_db_list_nodes
has been called and probDescDB can be queried for settings from the method specification.

13.146.3 Member Function Documentation

void calibrate ( ) [protected], [virtual]
Perform the uncertainty quantification

Implements NonDBayesCalibration.

13.147 NonlinearCGOptimizer Class Reference

Inheritance diagram for NonlinearCGOptimizer:
Public Member Functions

- NonlinearCGOptimizer (ProblemDescDB &problem_db, Model &model)
  
  standard constructor
- ~NonlinearCGOptimizer ()
  
  destructor
- Real linesearch_eval (const Real &trial_step, short req_val=1)
  
  evaluate the objective function given a particular step size (public for use in boost_ls_eval functor; could use friend)

Protected Member Functions

- void core_run ()
  
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Private Member Functions

- void parse_options ()
  
  constructor helper function to parse misc_options from ProblemDescDB
- void compute_direction ()
  
  compute next direction via choice of method
- bool compute_step ()
  
  compute step: fixed, simple decrease, sufficient decrease
- void bracket_min (Real &xa, Real &xb, Real &xc, Real &fa, Real &fb, Real &fc)
  
  bracket the 1-D minimum in the linesearch
- Real brent_minimize (Real a, Real b, Real tol)
  
  Perform 1-D minimization for the stepLength using Brent’s method.

Private Attributes

- Real initialStep
  
  initial step length
- Real linesearchTolerance
  
  approximate accuracy of absissca in LS
- unsigned linesearchType
  
  type of line search (if any)
• unsigned maxLinesearchIters
  maximum evaluations in line search
• Real relFunctionTol
  stopping criterion for rel change in fn
• Real relGradientTol
  stopping criterion for rel reduction in g
• bool resetStep
  whether to reset step with each linesearch
• unsigned restartIter
  iter at which to reset to steepest descent
• unsigned updateType
  type of CG direction update
• unsigned iterCurr
  current iteration number
• RealVector designVars
  current decision variables in the major iteration
• RealVector trialVars
  decision variables in the linesearch
• Real functionCurr
  current function value
• Real functionPrev
  previous function value
• RealVector gradCurr
  current gradient
• RealVector gradPrev
  previous gradient
• RealVector gradDiff
  temporary for gradient difference (gradCurr - gradPrev)
• RealVector searchDirection
  current aggregate search direction
• Real stepLength
  current step length parameter alpha
• Real gradDotGrad_init
  initial gradient norm squared
• Real gradDotGrad_curr
  gradCurr dot gradCurr
• Real gradDotGrad_prev
  gradPrev dot gradPrev

• void allocate_constraints ()
• int num_ineq_constraints () const
• const SizetList & nonlinear_inequality_mapping_indices () const
• const RealList & nonlinear_inequality_mapping_multipliers () const
• const RealList & nonlinear_inequality_mapping_offsets () const
• void set_unscaled_bounds (const RealVector &l_bnds, const RealVector &u_bnds)
  set {lower,upper}Bounds
• void scale (const RealVector &unscaled_x, RealArray &scaled_x) const
  perform scaling from [lower,upper] to [0,1]
• void unscale (const RealArray &scaled_x, RealVector &unscaled_x) const
  invert scaling to return from [0,1] to [lower,upper]

Private Attributes

• Model iteratedModel
  cache a local copy of the Model
• RealVector lowerBounds
  cache the active continuous lower bounds for scaling to [0,1]
• RealVector upperBounds
  cache the active continuous upper bounds for scaling to [0,1]
• int numNowpacIneqConstr
  aggregate unsupported constraint types as nonlinear inequalities
• SizetList nonlinIneqConMappingIndices
  a list of indices for referencing the DAKOTA nonlinear inequality constraints used in computing the corresponding NOWPAC constraints.

• RealList nonlinIneqConMappingMultipliers
  a list of multipliers for mapping the DAKOTA nonlinear inequality constraints to the corresponding NOWPAC constraints.

• RealList nonlinIneqConMappingOffsets
  a list of offsets for mapping the DAKOTA nonlinear inequality constraints to the corresponding NOWPAC constraints.

• SizetList linIneqConMappingIndices
  a list of indices for referencing the DAKOTA linear inequality constraints used in computing the corresponding NOWPAC constraints.

• RealList linIneqConMappingMultipliers
  a list of multipliers for mapping the DAKOTA linear inequality constraints to the corresponding NOWPAC constraints.

• RealList linIneqConMappingOffsets
  a list of offsets for mapping the DAKOTA linear inequality constraints to the corresponding NOWPAC constraints.

13.149.1 Detailed Description

Derived class for plugging Dakota evaluations into NOWPAC solver.

The documentation for this class was generated from the following files:

NPSOLTraits
```

Public Member Functions

- **NPSOLTraits ()**
  default constructor
- virtual ~**NPSOLTraits ()**
  destructor
- virtual bool **is_derived ()**
  A temporary query used in the refactor.
- bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.
- bool supports_linear_inequality ()
Return the flag indicating whether method supports linear equalities.

- `bool supports_linear_inequality()`

Return the flag indicating whether method supports linear inequalities.

- `bool supports_nonlinear_inequality()`

Return the flag indicating whether method supports nonlinear equalities.

- `bool supports_nonlinear_inequality()`

Return the flag indicating whether method supports nonlinear inequalities.

- `NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format()`

Return the format used for nonlinear inequality constraints.

### 13.152.1 Detailed Description

Wrapper class for the NPSOL optimization library.

The NPSOLOptimizer class provides a wrapper for NPSOL, a Fortran 77 sequential quadratic programming library from Stanford University marketed by Stanford Business Associates. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function or accessed through a static pointer.

The user input mappings are as follows: `max_function_evaluations` is implemented directly in NPSOLOptimizer’s evaluator functions since there is no NPSOL parameter equivalent, and `max_iterations`, `convergence_tolerance`, `output verbosity`, `verify_level`, `function precision`, and `linesearch_tolerance` are mapped into NPSOL’s “Major Iteration Limit”, “Optimality Tolerance”, “Major Print Level” (verbose: Major Print Level = 20; quiet: Major Print Level = 10), “Verify Level”, “Function Precision”, and “Linesearch Tolerance” parameters, respectively, using NPSOL’s `npoptn()` subroutine (as wrapped by `npoptn2()` from the `npoptn` wrapper.f file). Refer to [Gill, P.E., Murray, W., Saunders, M.A., and Wright, M.H., 1986] for information on NPSOL’s optional input parameters and the `npoptn()` subroutine. A version of TraitsBase specialized for NPSOL optimizers.

The documentation for this class was generated from the following file:

- NPSOLOptimizer.hpp

### 13.153 OptDartsOptimizer Class Reference

Wrapper class for OptDarts Optimizer.

Inheritance diagram for OptDartsOptimizer:

```
   +----------+        +----------+
   | Optimizer|        | Minimizer|
   +----------+        +----------+
                   +----------+
                   | Iterator |
```

OptDartsOptimizer
Public Member Functions

- **OptDartsOptimizer (ProblemDescDB &problem_db, Model &model)**
  Constructor.
- **OptDartsOptimizer (Model &model)**
  alternate constructor for Iterator instantiations by name
- **~OptDartsOptimizer ()**
  Destructor.
- **void core_run ()**
  Calls the OptDarts algorithm.

Private Member Functions

- **void load_parameters (Model &model)**
  Convenience function for Parameter loading.
- **double opt_darts_f ()**
  Function evaluation.
- **void opt_darts_execute (size_t num_dim, size_t budget, double *xmin, double *xmax, double TOL, size_t problem_index, double fw_MC, double fb_MC)**
  Run the OPT-DARTS method.
- **void opt_darts_initiate (double *xmin, double *xmax)**
  Initialize OPT-DARTS.
- **void opt_darts_reset_convex_hull ()**
- **size_t opt_darts_pick_candidate (size_t ifunc)**
  Choose the next trial iterate.
- **void retrieve_extended_neighbors (size_t icandidate)**

13.153.1 Detailed Description

Wrapper class for OptDarts Optimizer.
The documentation for this class was generated from the following files:

• OptDartsOptimizer.hpp
• OptDartsOptimizer.cpp

13.154 OptDartsTraits Class Reference

A version of TraitsBase specialized for OptDarts.
Inheritance diagram for OptDartsTraits:

![Inheritance Diagram]

Public Member Functions

• OptDartsTraits ()
  default constructor
• virtual ~OptDartsTraits ()
  destructor
• virtual bool is_derived ()
  A temporary query used in the refactor.
• bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.

13.154.1 Detailed Description

A version of TraitsBase specialized for OptDarts.
The documentation for this class was generated from the following file:

• OptDartsOptimizer.hpp
13.155  Optimizer Class Reference

Base class for the optimizer branch of the iterator hierarchy.

Inheritance diagram for Optimizer:

```
  Iterator
    Minimizer
      Optimizer
```

**Public Member Functions**

- `int num_nonlin_ineq_constraints_found () const`
- `template<typename AdapterT> bool get_variable_bounds_from_dakota (typename AdapterT::VecT &lower, typename AdapterT::VecT &upper)`
- `template<typename VecT> void get_responses_from_dakota (const RealVector &dak_fn_vals, VecT &funs, VecT &cEqs, VecT &cIneqs)`

**Static Public Member Functions**

Protected Attributes

• size_t `numObjectiveFns`
  number of objective functions (iterator view)
• bool `localObjectiveRecast`
  flag indicating whether local recasting to a single objective is used
• Optimizer * `prevOptInstance`
  pointer containing previous value of optimizerInstance
• int `numNonlinearIneqConstraintsFound`
  number of nonlinear ineq constraints actually used (based on conditional and bigRealBoundSize)
• std::vector<int> `constraintMapIndices`
  map from Dakota constraint number to APPS constraint number
• std::vector<double> `constraintMapMultipliers`
  multipliers for constraint transformations
• std::vector<double> `constraintMapOffsets`
  offsets for constraint transformations

Static Protected Attributes

• static Optimizer * `optimizerInstance`
  pointer to Optimizer instance used in static member functions

Private Member Functions

• void `reduce_model` (bool local_nls_recast, bool require_hessians)
  Wrap iteratedModel in a RecastModel that performs (weighted) multi-objective or sum-of-squared residuals transformation.
• void `objective_reduction` (const Response &full_response, const BoolDeque &sense, const RealVector &full_wts, Response &reduced_response) const
  forward mapping: maps multiple primary response functions to a single weighted objective for single-objective optimizers

Static Private Member Functions

• static void `primary_resp_reducer` (const Variables &full_vars, const Variables &reduced_vars, const Response &full_response, Response &reduced_response)
  Recast callback to reduce multiple objectives or residuals to a single objective, with gradients and Hessians as needed.
Additional Inherited Members

13.155.1 Detailed Description

Base class for the optimizer branch of the iterator hierarchy.

The Optimizer class provides common data and functionality for DOTOptimizer, CONMINOimsembler, N-PSOLOptimimizer, SNILLOptimimizer, NLPQLPOptimimizer, COLINOptimimizer, OptDartsOptimimizer, NCSUOptimimizer, NonlinearCGOptimimizer, NomadOptimimizer, and JEGAOptimimizer.

13.155.2 Member Function Documentation

```cpp
bool get_variable_bounds_from_dakota ( typename AdapterT::VecT & lower, typename AdapterT::VecT & upper ) [inline]
```
Adapter for transferring variable bounds from Dakota data to TPL data

References Minimizer::bigIntBoundSize, Minimizer::bigRealBoundSize, and Iterator::iteratedModel.

```cpp
void get_responses_from_dakota ( const RealVector & dak_fn_vals, VecT & funs, VecT & cEqs, VecT & cIneqs ) [inline]
```
Adapter for transferring responses from Dakota data to TPL data

References Optimizer::constraintMapIndices, Optimizer::constraintMapMultipliers, Optimizer::constraintMap-Offsets, Dakota::get_responses(), and Iterator::iteratedModel.

Referenced by APPSEvalMgr::recv().

```cpp
void initialize_run ( ) [protected], [virtual]
```
Implements portions of initialize_run specific to Optimizers. This function should be invoked (or reimplemented) by any derived implementations of initialize_run() (which would otherwise hide it).

Reimplemented from Minimizer.

Reimplemented in ROLOptimizer.

References Optimizer::configure_constraint_maps(), Minimizer::initialize_run(), Model::is_null(), Iterator::iterated-Model, Iterator::myModelLayers, Optimizer::optimizerInstance, Optimizer::prevOptInstance, and Model::update- _from_subordinate_model().

Referenced by ROLOptimizer::initialize_run().

```cpp
void post_run ( std::ostream & s ) [protected], [virtual]
```
Implements portions of post_run specific to Optimizers. This function should be invoked (or reimplemented) by any derived implementations of post_run() (which would otherwise hide it).

Reimplemented from Minimizer.

References Dakota::abort_handler(), Iterator::bestResponseArray, Iterator::bestVariablesArray, Variables::continuous_variables(), ScalingModel::cv_scaled2native(), Minimizer::local_recast_retrieve(), Optimizer::localObjectiveRecast, Model::model_rep(), Minimizer::post_run(), ScalingModel::resp_scaled2native(), Minimizer::scaleFlag, and Minimizer-::scalingModel.

```cpp
void finalize_run ( ) [inline], [protected], [virtual]
```
utility function to perform common operations following post_run(): deallocation and resetting of instance pointers

Optional: perform finalization phases of run sequence, like deallocating memory and resetting instance pointers. Commonly used in sub-iterator executions. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s finalize_run(), typically after performing its own implementation steps.
Reimplemented from Minimizer.
References Minimizer::finalize_run(), Optimizer::optimizerInstance, and Optimizer::prevOptInstance.

void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
Redefines default iterator results printing to include optimization results (objective functions and constraints).
Reimplemented from Iterator.
References Dakota::abort_handler(), Iterator::bestResponseArray, Iterator::bestVariablesArray, Minimizer::calibrationDataFlag, ExperimentData::config_vars(), Dakota::data_pairs, Minimizer::dataTransformModel, Minimizer::expData, Model::interface_id(), Dakota::lookup_by_val(), Model::model_rep(), Minimizer::numContinuousVars, Minimizer::numNonlinearConstraints, Minimizer::numUserPrimaryFns, Minimizer::optimizationFlag, Minimizer::original_model(), Model::primary_response_fn_weights(), DataTransformModel::print_best_responses(), Minimizer::print_residuals(), Model::response_size(), Iterator::run_identifier(), Variables::write(), and Dakota::write_data_partial().

void configure_constraint_maps ( ) [protected]
Implements configuration of constraint maps, etc...
References Dakota::abort_handler(), Minimizer::bigRealBoundSize, Dakota::configure_inequality_constraint_maps(), Optimizer::constraintMapIndices, Optimizer::constraintMapMultipliers, Optimizer::constraintMapOffsets, Iterator::iteratedModel, Optimizer::numNonlinearIneqConstraintsFound, and Iterator::traits().
Referenced by Optimizer::initialize_run().

void reduce_model ( bool local_nls_recast, bool require_hessians ) [private]
Wrap iteratedModel in a RecastModel that performs (weighted) multi-objective or sum-of-squared residuals transformation.
Reduce model for least-squares or multi-objective transformation. Doesn’t map variables, or secondary responses. Maps active set for Gauss-Newton. Maps primary responses to single objective so user vs. iterated matters.
References Iterator::activeSet, Model::assign_rep(), Minimizer::calibrationDataFlag, Model::current_response(), Response::function_gradients(), Iterator::gnewton_set_recast(), Model::hessian_type(), Iterator::iteratedModel, Iterator::myModelLayers, Minimizer::numContinuousVars, Minimizer::numFunctions, Minimizer::numIterPrimaryFns, Minimizer::numNonlinearConstraints, Minimizer::numNonlinearIneqConstraints, Optimizer::numObjectiveFns, Minimizer::numTotalCalibTerms, Minimizer::numUserPrimaryFns, Iterator::outputLevel, Model::primary_fn_type(), Optimizer::primary_resp_reducer(), Model::primary_response_fn_sense(), Model::primary_response_fn_weights(), ActiveSet::request_vector(), and Response::reshape().
Referenced by Optimizer::Optimizer().

void primary_resp_reducer ( const Variables & full_vars, const Variables & reduced_vars, const Response & full_response, Response & reduced_response ) [static], [private]
Recast callback to reduce multiple objectives or residuals to a single objective, with gradients and Hessians as needed.
Objective function map from multiple primary responses (objective or residuals) to a single objective. Currently supports weighted sum; may later want more general transformations, e.g., goal-oriented
References Iterator::iteratedModel, Optimizer::objective_reduction(), Optimizer::optimizerInstance, Iterator::outputLevel, Model::primary_response_fn_sense(), Model::primary_response_fn_weights(), and Model::subordinate_model().
Referenced by Optimizer::reduce_model().

13.155. OPTIMIZER CLASS REFERENCE

715
void objective_reduction ( const Response & full_response, const BoolDeque & sense, const RealVector & full_wts, Response & reduced_response ) const [private]

forward mapping: maps multiple primary response functions to a single weighted objective for single-objective optimizers

This function is responsible for the mapping of multiple objective functions into a single objective for publishing to single-objective optimizers. Used in DOTOptimizer, NPSOLOptimizer, SNLLOptimizer, and SGOPTApplication on every function evaluation. The simple weighting approach (using primaryRespFnWts) is the only technique supported currently. The weightings are used to scale function values, gradients, and Hessians as needed.

References Response::active_set_request_vector(), Response::function_gradient_view(), Response::function_gradients(), Response::function_hessian_view(), Response::function_hessians(), Response::function_value(), Response::function_values(), Response::num_functions(), Minimizer::numConstraints, Minimizer::objective(), Minimizer::objective_gradient(), Minimizer::objective_hessian(), Iterator::outputLevel, Dakota::write_col_vector_trans(), Dakota::write_data(), and Dakota::write_precision.

Referenced by Optimizer::primary_resp_reducer().

The documentation for this class was generated from the following files:
- DakotaOptimizer.hpp
- DakotaOptimizer.cpp

### 13.156 OutputManager Class Reference

Class to manage redirection of stdout/stderr, keep track of current redir state, and manage rank 0 output. Also manage tabular data output for post-processing with Matlab, Tecplot, etc. and delegate to Graphics for X Windows Graphics.

**Public Member Functions**

- **OutputManager ()**
  
  Default constructor (needed for default environment ctors)

- **OutputManager (const ProgramOptions &prog_opts, int dakota_world_rank=0, bool dakota_mpirun_flag=false)**

  Standard constructor, taking user-specified program options and optionally taking the rank of this process in Dakota's MPI Comm.

- **~OutputManager ()**

  Destructor that closes streams and other outputs.

- **void close_streams ()**

  helper to close streams during destructor or abnormal abort

- **Graphics & graphics ()**

  retrieve the graphics handler object

- **void parse (const ProgramOptions &prog_opts, const ProblemDescDB &problem_db)**

  Extract environment options from ProblemDescDB and update from late updates to ProgramOptions.

- **void startup_message (const String &start_msg)**

  Set the Dakota startup message ("Running on...")

- **void push_output_tag (const String &iterator_tag, const ProgramOptions &prog_opts, bool force_cout_redirect, bool force_rst_redirect)**

  Update the tag to use on files and rebind any streams as needed.
• String build_output_tag () const
  return the full output tag

• void pop_output_tag ()
  (Potentially) remove an output context and rebind streams

• void output_version (std::ostream &os=Cout) const
  Output the current *Dakota* version.

• void output_startup_message (std::ostream &os=Cout) const
  Output the startup header and time.

• void output_helper (const String &message, std::ostream &os) const
  Output only on *Dakota* world rank 0 (for version, help, etc.)

• void append_restart (const ParamResponsePair &prp)
  append a parameter/response set to the restart file

• void add_datapoint (const Variables &vars, const String &iface, const Response &response)
  adds data to each window in the 2d graphics and adds a row to the tabular data file based on the results of a model evaluation

• void create_tabular_datastream (const Variables &vars, const Response &resp)
  initialize the tabular datastream on iterator leaders

• void close_tabular ()
  close tabular datastream

• void graphics_counter (int cntr)
  set graphicsCntr equal to cntr

• int graphics_counter () const
  return graphicsCntr

• void tabular_counter_label (const std::string &label)
  set tabularCntrLabel equal to label

• void init_results_db ()
  At runtime, initialize the global *ResultsManager*, tagging filename with MPI worldRank + 1 if needed.

• void archive_input (const ProgramOptions &prog_opts) const
  Archive the input file to the results database.

**Public Attributes**

• bool graph2DFlag
  whether user requested 2D graphics plots

• bool tabularDataFlag
  whether user requested tabular data file

• bool resultsOutputFlag
  whether user requested results data output

• String tabularDataFile
  filename for tabulation of graphics data

• String resultsOutputFile
  filename for results data

• unsigned short modelEvalsSelection
  Models selected to store their evaluations.

• unsigned short interfEvalsSelection
  Interfaces selected to store their evaluations.
**Private Member Functions**

- void `initial_redirects` (const ProgramOptions &prog_opts)
  
  Perform initial output/error redirects from user requests.

- void `read_write_restart` (bool restart_requested, bool read_restart_flag, const String &read_restart_filename, size_t stop_restart_eval, const String &write_restart_filename)
  
  conditionally import evaluations from restart file, then always create or overwrite restart file

**Private Attributes**

- int `worldRank`
  
  output manager handles rank 0 only output when needed

- bool `mpirunFlag`
  
  some output is only for MPI runs

- StringArray `fileTags`
  
  set of tags for various input/output files (default none)

- ConsoleRedirector `coutRedirector`
  
  set of redirections for Dakota::Cout; stores any tagged filename when there are concurrent Iterators

- ConsoleRedirector `cerrRedirector`
  
  set of redirections for Dakota::Cerr; stores any tagged filename when there are concurrent Iterators and error redirection is requested

- std::vector< std::shared_ptr< RestartWriter >> `restartDestinations`
  
  Stack of active restart destinations; end is the last (active) redirection. All remain open until popped or destroyed.

- String `startupMessage`
  
  message to print at startup when proceeding to instantiate objects

- Graphics `dakotaGraphics`
  
  graphics and tabular data output handler used by meta-iterators, models, and approximations; encapsulated here so destroyed with the OutputManager

- unsigned short `tabularFormat`
  
  tabular format options; see enum

- int `graphicsCntr`
  
  used for x axis values in 2D graphics and for 1st column in tabular data

- std::ofstream `tabularDataFStream`
  
  file stream for tabulation of graphics data within compute_response

- std::string `tabularCntrLabel`
  
  label for counter used in first line comment w/i the tabular data file

- short `outputLevel`
  
  output level (for debugging only; not passed in)

- unsigned short `resultsOutputFormat`
  
  Output results format.

**13.156.1 Detailed Description**

Class to manage redirection of stdout/stderr, keep track of current redir state, and manage rank 0 output. Also manage tabular data output for post-processing with Matlab, Tecplot, etc. and delegate to Graphics for X Windows Graphics.
13.156.2 Constructor & Destructor Documentation

OutputManager (const ProgramOptions & prog_opts, int dakota_world_rank = 0, bool dakota_mpirun_flag = false)

Standard constructor, taking user-specified program options and optionally taking the rank of this process in Dakota’s MPI Comm.

Only get minimal information off ProgramOptions as may be updated later by broadcast.

References OutputManager::initial_redirects(), OutputManager::mpirunFlag, and Dakota::start_dakota_heartbeat().

13.156.3 Member Function Documentation

void pop_output_tag ( )

(Potentially) remove an output context and rebind streams

For now this assumes the tag is .<int>

References OutputManager::build_output_tag(), OutputManager::cerrRedirector, OutputManager::coutRedirector, OutputManager::fileTags, OutputManager::outputLevel, ConsoleRedirector::pop_back(), OutputManager::restartDestinations, and OutputManager::worldRank.

Referenced by ParallelLibrary::pop_output_tag().

void add_datapoint ( const Variables & vars, const String & iface, const Response & response )

adds data to each window in the 2d graphics and adds a row to the tabular data file based on the results of a model evaluation

Adds data to each 2d plot and each tabular data column (one for each active variable and for each response function). graphicsCntr is used for the x axis in the graphics and the first column in the tabular data.

References Response::active_set_request_vector(), Graphics::add_datapoint(), OutputManager::dakotaGraphics, OutputManager::graphicsCntr, OutputManager::tabularDataFStream, and OutputManager::tabularFormat.

Referenced by Model::evaluate(), Model::synchronize(), and Model::synchronize_nowait().

void create_tabular_datastream ( const Variables & vars, const Response & response )

initialize the tabular data stream on iterator leaders

Opens the tabular data file stream and prints headings, one for each active continuous and discrete variable and one for each response function, using the variable and response function labels. This tabular data is used for post-processing of DAKOTA results in Matlab, Tecplot, etc.

References OutputManager::build_output_tag(), OutputManager::tabularDataFile, OutputManager::tabularDataFStream, and OutputManager::tabularFormat.

Referenced by SurrBasedMinimizer::initialize_graphics(), and Iterator::initialize_graphics().

The documentation for this class was generated from the following files:

- OutputManager.hpp
- OutputManager.cpp

13.157 OutputWriter Class Reference

Public Member Functions

- OutputWriter (std::ostream & output_stream)

  `ostream constructor; used to construct a writer to existing stream, e.g., std::cout`
• **OutputWriter** (const String &output_filename)
  file redirect constructor; opens an overwriting file stream to given name
• const String & filename () const
  the (possibly empty) file name for this stream
• std::ostream * output_stream ()
  a pointer to the stream, either cout/cerr or a file

**Protected Attributes**

• String outputFilename
  the name of the output file (empty when constructed from pointer)
• std::ofstream outputFS
  file output stream for console text; only open if string non-empty
• std::ostream * outputStream
  pointer to the stream for this writer

13.157.1 Detailed Description

Component to manage a redirected output or error stream
The documentation for this class was generated from the following files:

• OutputManager.hpp
• OutputManager.cpp

13.158 ParallelConfiguration Class Reference

Container class for a set of ParallelLevel list iterators that collectively identify a particular multilevel parallel configuration.

**Public Member Functions**

• ParallelConfiguration ()
  default constructor
• ParallelConfiguration (const ParallelConfiguration &pl)
  copy constructor
• ~ParallelConfiguration ()
  destructor
• ParallelConfiguration & operator= (const ParallelConfiguration &pl)
  assignment operator
• const ParallelLevel & w_parallel_level () const
  return the ParallelLevel corresponding to miPLIters.front()
• const ParallelLevel & mi_parallel_level (size_t index=_NPOS) const
  return the ParallelLevel corresponding to miPLIters[index]
• const ParallelLevel & ie_parallel_level () const
  return the ParallelLevel corresponding to iePLIter
• const ParallelLevel & ea_parallel_level () const
  
  return the ParallelLevel corresponding to eaPLIter

• bool w_parallel_level_defined () const
  
  test for definition of world parallel level

• bool mi_parallel_level_defined (size_t index=_NPOS) const
  
  test for definition of meta-iterator-iterator parallel level

• bool ie_parallel_level_defined () const
  
  test for definition of iterator-evaluation parallel level

• bool ea_parallel_level_defined () const
  
  test for definition of evaluation-analysis parallel level

• ParLevLIter w_parallel_level_iterator () const
  
  return miPLIter.front()

• ParLevLIter mi_parallel_level_iterator (size_t index=_NPOS) const
  
  return miPLIter[index]

• ParLevLIter ie_parallel_level_iterator () const
  
  return iePLIter

• ParLevLIter ea_parallel_level_iterator () const
  
  return eaPLIter

• size_t mi_parallel_level_index (ParLevLIter pl_iter) const
  
  return the index within miPLIter corresponding to pl_iter

• size_t mi_parallel_level_last_index () const
  
  return the index of the last entry in miPLIter

Private Member Functions

• void assign (const ParallelConfiguration &pl)
  
  assign the attributes of the incoming pl to this object

Private Attributes

• short numParallelLevels
  
  number of parallel levels

• std::vector< ParLevLIter > miPLIter
  
  list iterator for world level followed by any concurrent iterator partitions (there may be multiple per parallel configuration instance)

• ParLevLIter iePLIter
  
  list iterator identifying the iterator-evaluation parallel level (there can only be one)

• ParLevLIter eaPLIter
  
  list iterator identifying the evaluation-analysis parallel level (there can only be one)

• ParLevLIter endPLIter
  
  snapshot of the end of ParallelLibrary::parallelLevels; used for detecting when a component of the parallel configuration has been initialized
CHAPTER 13. CLASS DOCUMENTATION

Friends

- class ParallelLibrary

  the ParallelLibrary class has special access priveleges in order to streamline implementation

13.158.1 Detailed Description

Container class for a set of ParallelLevel list iterators that collectively identify a particular multilevel parallel configuration.

Rather than containing the multilevel parallel configuration directly, ParallelConfiguration instead provides a set of list iterators which point into a combined list of ParallelLevels. This approach allows different configurations to reuse ParallelLevels without copying them. A list of ParallelConfigurations is contained in ParallelLibrary (ParallelLibrary::parallelConfigurations).

13.158.2 Member Function Documentation

const ParallelLevel & mi_parallel_level ( size_t index = _NPOS ) const [inline]

return the ParallelLevel corresponding to miPLIters[index]

If a meaningful index is not provided, return the last mi parallel level. This is useful within the Model context, for which we need the lowest level partition after any meta-iterator recursions.

References Dakota::_NPOS, and ParallelConfiguration::miPLIters.

Referenced by ApplicationInterface::set_evaluation_communicators().

ParLevLIter mi_parallel_level_iterator ( size_t index = _NPOS ) const [inline]

return miPLIters[index]

If a meaningful index is not provided, return the last mi parallel level. This is useful within the Model context, for which we need the lowest level partition after any meta-iterator recursions.

References Dakota::_NPOS, and ParallelConfiguration::miPLIters.

The documentation for this class was generated from the following file:

- ParallelLibrary.hpp

13.159 ParallelDirectApplicInterface Class Reference

Sample derived interface class for testing parallel simulator plug-ins using assign_rep().

Inheritance diagram for ParallelDirectApplicInterface:
Public Member Functions
- **ParallelDirectApplicInterface** (const Dakota::ProblemDescDB &problem_db, const MPI_Comm &analysis_comm)
  - constructor
- **~ParallelDirectApplicInterface** ()
  - destructor

Protected Member Functions
- int **derived_map_ac** (const Dakota::String &ac_name)
  - execute an analysis code portion of a direct evaluation invocation
- void **derived_map_asynch** (const Dakota::ParamResponsePair &pair)
  - no-op hides base error; job batching occurs within wait_local_evaluations()
- void **wait_local_evaluations** (Dakota::PRPQueue &prp_queue)
  - evaluate the batch of jobs contained in prp_queue
- void **test_local_evaluations** (Dakota::PRPQueue &prp_queue)
  - invokes wait_local_evaluations() (no special nowait support)
- void **set_communicators_checks** (int max_eval_concurrency)
  - no-op hides default run-time error checks at DirectApplicInterface level

Private Member Functions
- int **text_book** (const Dakota::RealVector &c_vars, const Dakota::ShortArray &asv, Dakota::RealVector &fn_vals, Dakota::RealMatrix &fn_grads, Dakota::RealSymMatrixArray &fn_hessians)
  - demo evaluator function for parallel plug-ins

Additional Inherited Members

13.159.1 Detailed Description
Sample derived interface class for testing parallel simulator plug-ins using assign_rep().

The plug-in **ParallelDirectApplicInterface** resides in namespace **SIM** and uses a copy of textbook() to perform parallel parameter to response mappings. It is used to demonstrate plugging in a parallel direct analysis driver into Dakota in library mode. Test input files can then use an analysis driver of “plugin_textbook”.

13.159.2 Member Function Documentation

void **test_local_evaluations** ( Dakota::PRPQueue & prp_queue ) [inline], [protected]

invokes wait_local_evaluations() (no special nowait support)

For use by ApplicationInterface::serve_evaluations_asynch(), which can provide a batch processing capability within message passing schedulers (called using chain ApplicationInterface::serve_evaluations() from Model::serve() from IteratorScheduler::run_iterator()).

References ParallelDirectApplicInterface::wait_local_evaluations().

The documentation for this class was generated from the following files:

- PluginParallelDirectApplicInterface.hpp
- PluginParallelDirectApplicInterface.cpp
13.160 ParallelLevel Class Reference

Container class for the data associated with a single level of communicator partitioning.

Public Member Functions

- **ParallelLevel ()**  
  default constructor

- **ParallelLevel (const ParallelLevel &pl)**  
  copy constructor

- **~ParallelLevel ()**  
  destructor

- **ParallelLevel & operator= (const ParallelLevel &pl)**  
  assignment operator

- **bool dedicated_master () const**  
  return dedicatedMasterFlag

- **bool server_master () const**  
  return serverMasterFlag

- **bool message_pass () const**  
  return messagePass

- **bool idle_partition () const**  
  return idlePartition

- **int num_servers () const**  
  return numServers

- **int processors_per_server () const**  
  return procsPerServer

- **int processor_remainder () const**  
  return procRemainder

- **const MPI_Comm & server_intra_communicator () const**  
  return serverIntraComm

- **int server_communicator_rank () const**  
  return serverCommRank

- **int server_communicator_size () const**  
  return serverCommSize

- **const MPI_Comm & hub_server_intra_communicator () const**  
  return hubServerIntraComm

- **int hub_server_communicator_rank () const**  
  return hubServerCommRank

- **int hub_server_communicator_size () const**  
  return hubServerCommSize

- **const MPI_Comm & hub_server_inter_communicator () const**  
  return hubServerInterComm

- **MPI_Comm * hub_server_inter_communicators () const**  
  return hubServerInterComms
• int server_id () const
  return serverId
• void read (MPIUnpackBuffer &s)
  read a ParallelLevel object from a packed MPI buffer
• void write (MPIPackBuffer &s) const
  write a ParallelLevel object to a packed MPI buffer
• bool null (const MPI_Comm &comm)
  test comm for MPI_COMM_NULL
• bool special (const MPI_Comm &comm)
  test comm for special identity that cannot be deallocated
• void clear ()
  deallocate the communicators in this ParallelLevel
• void alias (const ParallelLevel &pl)
  assign the attributes of the incoming pl to this object. For communicators, this is a lightweight copy which assigns
  the same pointer values as the incoming pl, resulting in the same context.
• void copy (const ParallelLevel &pl)
  deep copy the attributes of the incoming pl to this object using MPI_Comm_dup to create equivalent communicators
  with a unique context.
• void copy_config (const ParallelLevel &pl)
  copy the scalar attributes of the incoming pl to this object, omitting communicators

Private Attributes

• bool ownCommFlag
  signals Comm ownership for deallocation
• bool dedicatedMasterFlag
  signals dedicated master partitioning
• bool commSplitFlag
  signals a communicator split was used
• bool serverMasterFlag
  identifies master server processors
• bool messagePass
  flag for message passing at this level,
  < indicating work assignment among servers
• bool idlePartition
  identifies presence of an idle processor
  < partition at this level
• int numServers
  number of servers
• int procsPerServer
  processors per server
• int procRemainder
  proc remainder after equal distribution
• int serverId
server identifier

- **MPI_Comm serverIntraComm**
  intracomm. for each server partition
- **int serverCommRank**
  rank in serverIntraComm
- **int serverCommSize**
  size of serverIntraComm
- **MPI_Comm hubServerIntraComm**
  intracomm for all serverCommRank==0
  < w/i next higher level serverIntraComm
  - **int hubServerCommRank**
  rank in hubServerIntraComm
  - **int hubServerCommSize**
  size of hubServerIntraComm
  
  - **MPI_Comm hubServerInterComm**
  intercomm. between a server & the hub
  < (on server partitions only)
  - **MPI_Comm * hubServerInterComms**
  intercomm. array on hub processor

Friends

- class **ParallelLibrary**
  the ParallelLibrary class has special access privileges in order to streamline implementation

### 13.160.1 Detailed Description

(Container class for the data associated with a single level of communicator partitioning. A list of these levels is contained in ParallelLibrary (ParallelLibrary::parallelLevels), which defines all of the parallelism levels across one or more multilevel parallelism configurations.)

### 13.160.2 Member Function Documentation

```cpp
void clear() [inline]
```

deallocate the communicators in this ParallelLevel

This appears to be more robust outside of the destructor due to interactions among managed deallocation and default deallocation (e.g., explicitly freeing a communicator and then default deallocating its handle).

References ParallelLevel::dedicatedMasterFlag, ParallelLevel::hubServerInterComm, ParallelLevel::hubServerInterComms, ParallelLevel::hubServerIntraComm, ParallelLevel::idlePartition, ParallelLevel::numServers, ParallelLevel::ownCommFlag, ParallelLevel::serverId, ParallelLevel::serverIntraComm, and ParallelLevel::special().

The documentation for this class was generated from the following file:

- **ParallelLibrary.hpp**

### 13.161 ParallelLibrary Class Reference

Class for partitioning multiple levels of parallelism and managing message passing within these levels.
Public Member Functions

- **ParallelLibrary ()**
  
  default constructor (used for dummy_lib)

- **ParallelLibrary (const MPIManager &mpi_mgr, ProgramOptions &prog_opts, OutputManager &output_mgr)**
  
  stand-alone and default library mode constructor; don’t require options

- **~ParallelLibrary ()**
  
  destructor

- **const ParallelLevel & init_iterator_communicators (int iterator_servers, int procs_per_iterator, int min_procs_per_iterator, int max_procs_per_iterator, int max_iterator_concurrency, short default_config, short iteration_scheduling, bool peer_dynamic_avail)**
  
  split MPI_COMM_WORLD into iterator communicators

- **const ParallelLevel & init_evaluation_communicators (int evaluation_servers, int procs_per_evaluation, int min_procs_per_evaluation, int max_procs_per_evaluation, int max_evaluation_concurrency, int asynch_local_evaluation_concurrency, short default_config, short evaluation_scheduling, bool peer_dynamic_avail)**
  
  split an iterator communicator into evaluation communicators

- **const ParallelLevel & init_analysis_communicators (int analysis_servers, int procs_per_analysis, int min_procs_per_analysis, int max_procs_per_analysis, int max_analysis_concurrency, int asynch_local_analysis_concurrency, short default_config, short analysis_scheduling, bool peer_dynamic_avail)**
  
  split an evaluation communicator into analysis communicators

- **void print_configuration ()**
  
  print the parallel level settings for a particular parallel configuration

- **void push_output_tag (const ParallelLevel &pl)**
  
  conditionally append an iterator server id tag to the hierarchical output tag, manage restart, and rebind cout/cerr

- **void pop_output_tag (const ParallelLevel &pl)**
  
  pop the last output tag and rebind streams as needed; pl isn’t yet used, but may be in the future when we generalize to arbitrary output context switching

- **void write_restart (const ParamResponsePair &prp)**
  
  write a parameter/response set to the restart file

- **ProgramOptions & program_options ()**
  
  return programOptions reference

- **OutputManager & output_manager ()**
  
  return outputManager reference

- **void terminate_modelcenter ()**
  
  terminate ModelCenter if running

- **void abort_helper (int code)**
  
  finalize MPI with correct communicator for abort

- **bool command_line_check () const**
  
  return checkFlag

- **bool command_line_pre_run () const**
  
  return preRunFlag

- **bool command_line_run () const**
  
  return runFlag

- **bool command_line_post_run () const**

return postRunFlag

• bool command_line_user_modes () const  
  return userModesFlag

• const String & command_line_pre_run_input () const  
  preRunInput filename

• const String & command_line_pre_run_output () const  
  preRunOutput filename

• const String & command_line_run_input () const  
  runInput filename

• const String & command_line_run_output () const  
  runOutput filename

• const String & command_line_post_run_input () const  
  postRunInput filename

• const String & command_line_post_run_output () const  
  postRunOutput filename

• void send (MPIPackBuffer &send_buff, int dest, int tag, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  blocking buffer send at the current communication level

• void send (int &send_int, int dest, int tag, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  blocking integer send at the current communication level

• void isend (MPIPackBuffer &send_buff, int dest, int tag, MPI_Request &send_req, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  nonblocking buffer send at the current communication level

• void isend (int &send_int, int dest, int tag, MPI_Request &send_req, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  nonblocking integer send at the current communication level

• void recv (MPIUnpackBuffer &recv_buff, int source, int tag, MPI_Status &status, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  blocking buffer receive at the current communication level

• void recv (int &recv_int, int source, int tag, MPI_Status &status, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  blocking integer receive at the current communication level

• void irecv (MPIUnpackBuffer &recv_buff, int source, int tag, MPI_Request &recv_req, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  nonblocking buffer receive at the current communication level

• void irecv (int &recv_int, int source, int tag, MPI_Request &recv_req, const ParallelLevel &parent_pl, const ParallelLevel &child_pl)  
  nonblocking integer receive at the current communication level

• void check_mi_index (size_t &index) const  
  process _NPOS default and perform error checks

• void send_mi (int &send_int, int dest, int tag, size_t index=_NPOS)  
  blocking send at the metaiterator-iterator communication level

• void isend_mi (int &send_int, int dest, int tag, MPI_Request &send_req, size_t index=_NPOS)  
  nonblocking send at the metaiterator-iterator communication level
• void recv_mi(int &recv_int, int source, int tag, MPI_Status &status, size_t index=NPOS)
  blocking receive at the metaiterator-iterator communication level
• void irecv_mi(int &recv_int, int source, int tag, MPI_Request &recv_req, size_t index=NPOS)
  nonblocking receive at the metaiterator-iterator communication level
• void send_mi(MPIPackBuffer &send_buff, int dest, int tag, size_t index=NPOS)
  blocking send at the metaiterator-iterator communication level
• void isend_mi(MPIPackBuffer &send_buff, int dest, int tag, MPI_Request &send_req, size_t index=NPOS)
  nonblocking send at the metaiterator-iterator communication level
• void recv_mi(MPIUnpackBuffer &recv_buff, int source, int tag, MPI_Status &status, size_t index=NPOS)
  blocking receive at the metaiterator-iterator communication level
• void irecv_mi(MPIUnpackBuffer &recv_buff, int source, int tag, MPI_Request &recv_req, size_t index=NPOS)
  nonblocking receive at the metaiterator-iterator communication level
• void send_ie(int &send_int, int dest, int tag)
  blocking send at the iterator-evaluation communication level
• void isend_ie(int &send_int, int dest, int tag, MPI_Request &send_req)
  nonblocking send at the iterator-evaluation communication level
• void recv_ie(int &recv_int, int source, int tag, MPI_Status &status)
  blocking receive at the iterator-evaluation communication level
• void irecv_ie(int &recv_int, int source, int tag, MPI_Request &recv_req)
  nonblocking receive at the iterator-evaluation communication level
• void send_ie(MPIPackBuffer &send_buff, int dest, int tag)
  blocking send at the iterator-evaluation communication level
• void isend_ie(MPIPackBuffer &send_buff, int dest, int tag, MPI_Request &send_req)
  nonblocking send at the iterator-evaluation communication level
• void recv_ie(MPIUnpackBuffer &recv_buff, int source, int tag, MPI_Status &status)
  blocking receive at the iterator-evaluation communication level
• void irecv_ie(MPIUnpackBuffer &recv_buff, int source, int tag, MPI_Request &recv_req)
  nonblocking receive at the iterator-evaluation communication level
• void send_ea(int &send_int, int dest, int tag)
  blocking send at the evaluation-analysis communication level
• void isend_ea(int &send_int, int dest, int tag, MPI_Request &send_req)
  nonblocking send at the evaluation-analysis communication level
• void recv_ea(int &recv_int, int source, int tag, MPI_Status &status)
  blocking receive at the evaluation-analysis communication level
• void irecv_ea(int &recv_int, int source, int tag, MPI_Request &recv_req)
  nonblocking receive at the evaluation-analysis communication level
• void bcast(int &data, const ParallelLevel &pl)
  broadcast an integer across the serverIntraComm of a ParallelLevel
• void bcast(short &data, const ParallelLevel &pl)
  broadcast an integer across the serverIntraComm of a ParallelLevel
• void bcast(MPIPackBuffer &send_buff, const ParallelLevel &pl)
  broadcast a MPIPackBuffer across the serverIntraComm of a ParallelLevel
• void bcast (MPIUnpackBuffer &recv_buff, const ParallelLevel &pl)
  broadcast a MPIUnpackBuffer across the serverIntraComm of a ParallelLevel
• void bcast_hs (int &data, const ParallelLevel &pl)
  broadcast an integer across the hubServerIntraComm of a ParallelLevel
• void bcast_hs (MPIPackBuffer &send_buff, const ParallelLevel &pl)
  broadcast a MPIPackBuffer across the hubServerIntraComm of a ParallelLevel
• void bcast_hs (MPIUnpackBuffer &recv_buff, const ParallelLevel &pl)
  broadcast a MPIUnpackBuffer across the hubServerIntraComm of a ParallelLevel
• void bcast_w (int &data)
  broadcast an integer across MPI_COMM_WORLD
• void bcast_i (int &data, size_t index=NPOS)
  broadcast an integer across an iterator communicator
• void bcast_i (short &data, size_t index=NPOS)
  broadcast a short integer across an iterator communicator
• void bcast_e (int &data)
  broadcast an integer across an evaluation communicator
• void bcast_a (int &data)
  broadcast an integer across an analysis communicator
• void bcast_mi (int &data, size_t index=NPOS)
  broadcast an integer across a metaiterator-iterator intra communicator
• void bcast_w (MPIPackBuffer &send_buff)
  broadcast a packed buffer across MPI_COMM_WORLD
• void bcast_i (MPIPackBuffer &send_buff, size_t index=NPOS)
  broadcast a packed buffer across an iterator communicator
• void bcast_e (MPIPackBuffer &send_buff)
  broadcast a packed buffer across an evaluation communicator
• void bcast_a (MPIPackBuffer &send_buff)
  broadcast a packed buffer across an analysis communicator
• void bcast_mi (MPIPackBuffer &send_buff, size_t index=NPOS)
  broadcast a packed buffer across a metaiterator-iterator intra communicator
• void bcast_w (MPIUnpackBuffer &recv_buff)
  matching receive for packed buffer broadcast across MPI_COMM_WORLD
• void bcast_i (MPIUnpackBuffer &recv_buff, size_t index=NPOS)
  matching receive for packed buffer bcast across an iterator communicator
• void bcast_e (MPIUnpackBuffer &recv_buff)
  matching receive for packed buffer bcast across an evaluation communicator
• void bcast_a (MPIUnpackBuffer &recv_buff)
  matching receive for packed buffer bcast across an analysis communicator
• void bcast_mi (MPIUnpackBuffer &recv_buff, size_t index=NPOS)
  matching recv for packed buffer bcast across a metaiterator-iterator intra comm
• void barrier_w ()
  enforce MPI_Barrier on MPI_COMM_WORLD
• void barrier_i (size_t index=NPOS)
equiv MPI_Barrier on an iterator communicator

• void barrier_e ()

equiv MPI_Barrier on an evaluation communicator

• void barrier_a ()

equiv MPI_Barrier on an analysis communicator

• void reduce_sum_ea (double *local_vals, double *sum_vals, int num_vals)
  
compute a sum over an eval-analysis intra-communicator using MPI_Reduce

• void reduce_sum_a (double *local_vals, double *sum_vals, int num_vals)
  
compute a sum over an analysis communicator using MPI_Reduce

• void test (MPI_Request &request, int &test_flag, MPI_Status &status)
  
test a nonblocking send/receive request for completion

• void wait (MPI_Request &request, MPI_Status &status)
  
wait for a nonblocking send/receive request to complete

• void waitall (int num_recvs, MPI_Request *&recv_reqs)
  
wait for all messages from a series of nonblocking receives

• void waitsome (int num_sends, MPI_Request *&recv_requests, int &num_recvs, int *index_array, MPI_Status *&status_array)
  
wait for at least one message from a series of nonblocking receives but complete all that are available

• void free (MPI_Request &request)
  
free an MPI_Request

• int world_size () const
  
return MPIManager::worldSize

• int world_rank () const
  
return MPIManager::worldRank

• bool mpirun_flag () const
  
return MPIManager::mpirunFlag

• bool is_null () const
  
return dummyFlag

• Real parallel_time () const
  
returns current MPI wall clock time

• void parallel_configuration_iterator (ParConfigLIter pc_iter)
  
set the current ParallelConfiguration node

• ParConfigLIter parallel_configuration_iterator () const
  
return the current ParallelConfiguration node

• const ParallelConfiguration & parallel_configuration () const
  
return the current ParallelConfiguration instance

• size_t num_parallel_configurations () const
  
returns the number of entries in parallelConfigurations

• bool parallel_configuration_is_complete ()
  
identifies if the current ParallelConfiguration has been fully populated

• void increment_parallel_configuration (ParLevLIter mi_pl_iter)
  
add a new node to parallelConfigurations and increment currPCIter; limit miPLIter within new configuration to mi_pl_iter level
• void increment_parallel_configuration ()
  add a new node to parallelConfigurations and increment currPCIter; copy all of miPLIterators into new configuration

• bool w_parallel_level_defined () const
  test current parallel configuration for definition of world parallel level

• bool mi_parallel_level_defined (size_t index=NPOS) const
  test current parallel configuration for definition of meta-iterator-iterator parallel level

• bool ie_parallel_level_defined () const
  test current parallel configuration for definition of iterator-evaluation parallel level

• bool ea_parallel_level_defined () const
  test current parallel configuration for definition of evaluation-analysis parallel level

• ParLevLIter w_parallel_level_iterator ()
  for this level, access through ParallelConfiguration is not necessary

• size_t parallel_level_index (ParLevLIter pl_iter)
  return the index within parallelLevels corresponding to pl_iter

• std::vector<MPI_Comm> analysis_intra_communicators ()
  return the set of analysis intra communicators for all parallel configurations (used for setting up direct simulation interfaces prior to execution time).

Private Member Functions

• void init_mpi_comm ()
  convenience function for initializing DAKOTA’s top-level MPI communicators, based on dakotaMPIComm

• void initialize_timers ()
  initialize DAKOTA and UTILIB timers

• void output_timers ()
  conditionally output timers in destructor

• void init_communicators (const ParallelLevel &parent_pl, int num_servers, int procs_per_server, int min_procs_per_server, int max_procs_per_server, int max_concurrency, int asynch_local_concurrency, short default_config, short scheduling_override, bool peer_dynamic_avail)
  split a parent communicator into child server communicators

• void split_communicator_dedicated_master (const ParallelLevel &parent_pl, ParallelLevel &child_pl)
  split a parent communicator into a dedicated master processor and num_servers child communicators

• void split_communicator_peer_partition (const ParallelLevel &parent_pl, ParallelLevel &child_pl)
  split a parent communicator into num_servers peer child communicators (no dedicated master processor)

• void resolve_inputs (ParallelLevel &child_pl, int avial_procs, int min_procs_per_server, int max_procs_per_server, int max_concurrency, int capacity_multiplier, short default_config, short scheduling_override, bool peer_dynamic_available, bool print_rank)
  resolve user inputs into a sensible partitioning scheme

• void bcast (int &data, const MPI_Comm &comm)
  broadcast an integer across a communicator

• void bcast (short &data, const MPI_Comm &comm)
  broadcast a short integer across a communicator

• void bcast (MPIPackBuffer &send_buff, const MPI_Comm &comm)
  send a packed buffer across a communicator using a broadcast
• void bcast (MPIUnpackBuffer &recv_buff, const MPI_Comm &comm)
  matching receive for a packed buffer broadcast
• void barrier (const MPI_Comm &comm)
  enforce MPI_Barrier on comm
• void reduce_sum (double *local_vals, double *sum_vals, int num_vals, const MPI_Comm &comm)
  compute a sum over comm using MPI_Reduce
• void check_error (const String &err_source, int err_code)
  check the MPI return code and abort if error
• void alias_as_server_comm (const ParallelLevel &parent_pl, ParallelLevel &child_pl)
  convenience function for updating child serverIntraComm from parent serverIntraComm (shallow Comm copy)
• void copy_as_server_comm (const ParallelLevel &parent_pl, ParallelLevel &child_pl)
  convenience function for updating child serverIntraComm from parent serverIntraComm (deep Comm copy)
• void alias_as_hub_server_comm (const ParallelLevel &parent_pl, ParallelLevel &child_pl)
  convenience function for updating child hubServerIntraComm from parent serverIntraComm (shallow Comm copy)
• void copy_as_hub_server_comm (const ParallelLevel &parent_pl, ParallelLevel &child_pl)
  convenience function for updating child hubServerIntraComm from parent serverIntraComm (deep Comm copy)

Private Attributes

• const MPIManager & mpiManager
  reference to the MPI manager with Dakota’s MPI options
• ProgramOptions & programOptions
  programOptions is non-const due to updates from broadcast
• OutputManager & outputManager
  Non-const output handler to help with file redirection.
• bool dummyFlag
  prevents multiple MPI_Finalize calls due to dummylib
• bool outputTimings
  timing info only beyond help/version/check
• Real startCPUtime
  start reference for UTILIB CPU timer
• Real startWCTime
  start reference for UTILIB wall clock timer
• Real startMPTime
  start reference for MPI wall clock timer
• long startClock
  start reference for local clock() timer measuring <parent+child CPU
• std::list<ParallelLevel> parallelLevels
  the complete set of parallelism levels for managing multilevel parallelism among one or more configurations
• std::list<ParallelConfiguration> parallelConfigurations
  the set of parallel configurations which manage list iterators for indexing into parallelLevels
• ParConfigLIter currPCIter
  list iterator identifying the current node in parallelConfigurations
13.161.1 Detailed Description

Class for partitioning multiple levels of parallelism and managing message passing within these levels.

The ParallelLibrary class encapsulates all of the details of performing message passing within multiple levels of parallelism. It provides functions for partitioning of levels according to user configuration input and functions for passing messages within and across MPI communicators for each of the parallelism levels. If support for other message-passing libraries beyond MPI becomes needed (PVM, ...), then ParallelLibrary would be promoted to a base class with virtual functions to encapsulate the library-specific syntax.

13.161.2 Constructor & Destructor Documentation

ParallelLibrary()

default constructor (used for dummy_lib)

This constructor is used for creation of the global dummy_lib object, which is used to satisfy initialization requirements when the real ParallelLibrary object is not available.

ParallelLibrary (const MPIManager & mpi_mgr, ProgramOptions & prog_opts, OutputManager & output_mgr)

stand-alone and default library mode constructor; don’t require options

library mode constructor accepting communicator

TODO: Update comment.

Same constructor is used for executable and library environments and sequencing of object construction is ordered, so no need to separately get updates off command line (programOptions)

References ParallelLibrary::init_mpi_comm(), and ParallelLibrary::initialize_timers().

13.161.3 Member Function Documentation

void push_output_tag (const ParallelLevel & pl)

conditionally append an iterator server id tag to the hierarchical output tag, manage restart, and rebind cout/cerr

If the user has specified the use of files for DAKOTA standard output and/or standard error, then bind these filenames to the Cout/Cerr macros. In addition, if concurrent iterators are to be used, create and tag multiple output streams in order to prevent jumbled output. Manage restart file(s) by processing any incoming evaluations from an old restart file and by setting up the binary output stream for new evaluations. Only master iterator processor(s) read & write restart information. This function must follow init_iterator_communicators so that restart can be managed properly for concurrent iterator strategies. In the case of concurrent iterators, each iterator has its own restart file tagged with iterator number.

References ParallelLibrary::bcast(), ParallelLevel::dedicatedMasterFlag, OutputManager::graph2DFlag, ParallelLevel::hubServerCommRank, ParallelLevel::hubServerCommSize, ParallelLevel::hubServerIntraComm, ParallelLevel::numServers, ParallelLibrary::outputManager, ParallelLibrary::programOptions, OutputManager::push_output_tag(), OutputManager::resultsOutputFile, OutputManager::resultsOutputFlag, ParallelLevel::serverCommRank, ParallelLevel::serverId, MPIPackBuffer::size(), OutputManager::tabularDataFile, and OutputManager::tabularDataFlag.

Referenced by Environment::construct(), and IteratorScheduler::partition().

void terminate_modelcenter()

terminate ModelCenter if running
13.161. PARALLEL LIBRARY CLASS REFERENCE

Close streams associated with manage_outputs and manage_restart and terminate any additional services that may be active.

References Dakota::abort_handler(), Dakota::dc_ptr_int, and Dakota::mc_ptr_int.
Referenced by ParallelLibrary::~ParallelLibrary().

```cpp
void increment_parallel_configuration ( ParLevLIter mi_pl_iter ) [inline]
```

add a new node to parallelConfigurations and increment currPCIter; limit miPLIters within new configuration to mi_pl_iter level

Called from the ParallelLibrary ctor and from Model::init_communicators(). An increment is performed for each Model initialization except the first (which inherits the world level from the first partial configuration).

References ParallelLibrary::currPCIter, ParallelConfiguration::eaPLIter, ParallelConfiguration::endPLIter, ParallelConfiguration::iePLIter, ParallelConfiguration::miPLIters, ParallelConfiguration::numParallelLevels, ParallelLibrary::parallelConfigurations, and ParallelLibrary::parallelLevels.
Referenced by Iterator::init_communicators(), and Model::init_communicators().

```cpp
void init_mpi_comm ( ) [private]
```

convenience function for initializing DAKOTA’s top-level MPI communicators, based on dakotaMPIComm

shared function for initializing based on passed MPI_Comm

References Dakota::abort_handler(), MPIManager::dakota_mpi_comm(), ParallelLibrary::increment_parallel_configuration(), ParallelLibrary::mpiManager, MPIManager::mpirun_flag(), ParallelLibrary::outputManager, ParallelLibrary::parallelLevels, ParallelLevel::procsPerServer, ParallelLevel::serverCommRank, ParallelLevel::serverCommSize, ParallelLevel::serverId, ParallelLevel::serverIntraComm, ParallelLevel::serverMasterFlag, ParallelLibrary::startMPTime, OutputManager::startup_message(), MPIManager::world_rank(), and MPIManager::world_size().
Referenced by ParallelLibrary::ParallelLibrary().

```cpp
void init_communicators ( const ParallelLevel & parent_pl, int num_servers, int procs_per_server, int min_procs_per_server, int max_procs_per_server, int max_concurrency, int async_local_concurrency, short default_config, short scheduling_override, bool peer_dynamic_avail ) [private]
```

split a parent communicator into child server communicators

Split parent communicator into concurrent child server partitions as specified by the passed parameters. This constructs new child intra-communicators and parent-child inter-communicators. This fn is called from Meta-Iterators and NestedModel for the concurrent iterator level and from ApplicationInterface::init_communicators() for the concurrent evaluation and concurrent analysis levels.

References ParallelLibrary::currPCIter, ParallelLevel::dedicatedMasterFlag, ParallelLevel::messagePass, ParallelLevel::numServers, ParallelLibrary::parallelLevels, ParallelLevel::procsPerServer, ParallelLibrary::resolve_inputs(), ParallelLevel::serverCommRank, ParallelLevel::serverCommSize, ParallelLibrary::split_communicator_dedicated_master(), and ParallelLibrary::split_communicator_peer_partition().
Referenced by ParallelLibrary::init_analysis_communicators(), ParallelLibrary::init_evaluation_communicators(), and ParallelLibrary::init_iterator_communicators().

```cpp
void resolve_inputs ( ParallelLevel & child_pl, int avail_procs, int min_procs_per_server, int max_procs_per_server, int max_concurrency, int capacity_multiplier, short default_config, short scheduling_override, bool peer_dynamic_avail, bool print_rank ) [private]
```

resolve user inputs into a sensible partitioning scheme
This function is responsible for the "auto-configure" intelligence of DAKOTA. It resolves a variety of inputs and overrides into a sensible partitioning configuration for a particular parallelism level. It also handles the general case in which a user’s specification request does not divide out evenly with the number of available processors for the level. If num_servers & procs_per_server are both nondefault, then the former takes precedence.

References Dakota::abort_handler(), ParallelLevel::dedicatedMasterFlag, ParallelLevel::numServers, ParallelLevel::procRemainder, and ParallelLevel::procsPerServer.

Referenced by ParallelLibrary::initCommunicators().

The documentation for this class was generated from the following files:

- ParallelLibrary.cpp

### 13.162 ParamResponsePair Class Reference

Container class for a variables object, a response object, and an evaluation id.

#### Public Member Functions

- **ParamResponsePair ()**
  
  default constructor

- **ParamResponsePair (const Variables &vars, const String &interface_id, const Response &response, bool deep_copy=false)**
  
  alternate constructor for temporaries

- **ParamResponsePair (const Variables &vars, const String &interface_id, const Response &response, const int eval_id, bool deep_copy=true)**
  
  standard constructor for history uses

- **ParamResponsePair (const ParamResponsePair &pair)**
  
  copy constructor

- **~ParamResponsePair ()**
  
  destructor

- **ParamResponsePair & operator= (const ParamResponsePair &pair)**
  
  assignment operator

- **void read (std::istream &s)**
  
  read a ParamResponsePair object from an std::istream

- **void write (std::ostream &s) const**
  
  write a ParamResponsePair object to an std::ostream

- **void read_annotated (std::istream &s)**
  
  read a ParamResponsePair object in annotated format from an std::istream

- **void write_annotated (std::ostream &s) const**
  
  write a ParamResponsePair object in annotated format to an std::ostream

- **void write_tabular (std::ostream &s, unsigned short tabular_format) const**
  
  write a ParamResponsePair object in tabular format (all variables active/inactive) to an std::ostream

- **void write_tabular_labels (std::ostream &s, unsigned short tabular_format) const**
  
  write PRP labels in tabular format to an std::ostream

- **void read (MPIUnpackBuffer &s)**
read a ParamResponsePair object from a packed MPI buffer

- void write (MPIPackBuffer &s) const

write a ParamResponsePair object to a packed MPI buffer

- int eval_id () const
  return the evaluation identifier

- void eval_id (int id)
  set the evaluation identifier

- const String & interface_id () const
  return the interface identifier from evalInterfaceIds

- void interface_id (const String &id)
  set the interface identifier within evalInterfaceIds

- const IntStringPair & eval_interface_ids () const
  return the aggregate eval/interface identifier from the response object

- const Variables & variables () const
  return the parameters object

- void variables (const Variables &vars)
  set the parameters object

- const Response & response () const
  return the response object

- void response (const Response &resp)
  set the response object

- const ActiveSet & active_set () const
  return the active set object from the response object

- void active_set (const ActiveSet &set)
  set the active set object within the response object

Private Member Functions

- template<class Archive >
  void serialize (Archive &ar, const unsigned int version)
  serialize the PRP: write and read are symmetric for this class

Private Attributes

- Variables prpVariables
  the set of parameters for the function evaluation

- Response prpResponse
  the response set for the function evaluation

- IntStringPair evalInterfaceIds
  the evalInterfaceIds aggregate
Friends

- class boost::serialization::access
  allow boost access to serialize this class
- bool operator== (const ParamResponsePair &pair1, const ParamResponsePair &pair2)
  equality operator
- bool operator!=(const ParamResponsePair &pair1, const ParamResponsePair &pair2)
  inequality operator

13.162.1 Detailed Description

Container class for a variables object, a response object, and an evaluation id.

**ParamResponsePair** provides a container class for association of the input for a particular function evaluation (a variables object) with the output from this function evaluation (a response object), along with an evaluation identifier. This container defines the basic unit used in the data_pairs cache, in restart file operations, and in a variety of scheduling algorithm queues. With the advent of STL, replacement of arrays of this class with map<> and pair<> template constructs may be possible (using map<pair<int,String>, pair<Variables,Response>>, for example), assuming that deep copies, I/O, alternate constructors, etc., can be adequately addressed. Boost tuple<> may also be a candidate.

13.162.2 Constructor & Destructor Documentation

**ParamResponsePair ( const Variables & vars, const String & interface_id, const Response & response, bool deep_copy = false ) [inline]**

alternate constructor for temporaries

Uses of this constructor often employ the standard Variables and Response copy constructors to share representations since this constructor is commonly used for search_pairs (which are local instantiations that go out of scope prior to any changes to values; i.e., they are not used for history).

**ParamResponsePair ( const Variables & vars, const String & interface_id, const Response & response, const int eval_id, bool deep_copy = true ) [inline]**

standard constructor for history uses

Uses of this constructor often do not share representations since deep copies are used when history mechanisms (e.g., data_pairs and beforeSynchCorePRPQueue) are involved.

13.162.3 Member Function Documentation

**void read ( MPIUnpackBuffer & s ) [inline]**

read a **ParamResponsePair** object from a packed MPI buffer

Interface Id is omitted since master processor retains interface ids and communicates asv and response data only with slaves.

References **ParamResponsePair::evalInterfaceIds**, **ParamResponsePair::prpResponse**, and **ParamResponsePair::prpVariables**.
void write ( MPIPackBuffer & s ) const  [inline]

write a ParamResponsePair object to a packed MPI buffer

interfaceId is omitted since master processor retains interface ids and communicates avs and response data
only with slaves.

References ParamResponsePair::evalInterfaceIds, ParamResponsePair::prpResponse, and ParamResponsePair-
::prpVariables.

13.162.4 Member Data Documentation

IntStringPair evalInterfaceIds  [private]

the evalInterfaceIds aggregate

the function evaluation identifier (assigned from Interface::evalIdCntr) is paired with the interface used to
generate the response object. Used in PRPCache id_vars_set_compare to prevent duplicate detection on results
from different interfaces. evalInterfaceIds belongs here rather than in Response since some Response objects
involve consolidation of several fn evals (e.g., Model::synchronize_derivatives()) that are not, in total, generated
by a single interface. The prPair, on the other hand, is used for storage of all low level fn evals that get evaluated
in ApplicationInterface::map().

Referenced by ParamResponsePair::eval_id(), ParamResponsePair::eval_interface_ids(), ParamResponsePair-
::interface_id(), ParamResponsePair::operator=(), Dakota::operator==(), ParamResponsePair::read(), and Param-
ResponsePair::write().

13.163 ParamStudy Class Reference

Class for vector, list, centered, and multidimensional parameter studies.

Inheritance diagram for ParamStudy:

```
ParamStudy
  
  PStudyDACE
    
    Analyzer
      
      Iterator
```

Public Member Functions

- ParamStudy (ProblemDescDB &problem_db, Model &model)
  constructor
- ~ParamStudy ()
  destructor
- bool resize ()
reinitializes iterator based on new variable size

- void pre_run()
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

- void core_run()
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

- void post_input()
  read tabular data for post-run mode

- void post_run(std::ostream &s)
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

- void archive_model_variables (const Model &, size_t idx) const override
  Archive variables for parameter set idx.

- void archive_model_response (const Response &, size_t idx) const override
  Archive responses for parameter set idx.

Protected Member Functions

- void archive_allocate_sets () const
  Allocate space to archive parameters and responses.

Private Member Functions

- void sample()
  performs the parameter study by sampling from a list of points

- void vector_loop()
  performs the parameter study by sampling along a vector, starting from an initial point followed by numSteps increments along continuous/discrete step vectors

- void centered_loop()
  performs a number of plus and minus offsets for each parameter centered about an initial point

- void multidim_loop()
  performs a full factorial combination for all intersections defined by a set of multidimensional partitions

- bool load_distribute_points (const String &points_filename, unsigned short tabular_format, bool active_only)
  load list of points from data file and distribute among listCVPoints, listDIVPoints, listDSVPoints, and listDRVPoints

- template<typename OrdinalType, typename ScalarTypeA, typename ScalarTypeC, typename ScalarTypeDI, typename ScalarTypeDS, typename ScalarTypeDR>
  bool distribute (const Teuchos::SerialDenseVector<OrdinalType, ScalarTypeA> &all_data, Teuchos::SerialDenseVector<OrdinalType, ScalarTypeC> &c_data, Teuchos::SerialDenseVector<OrdinalType, ScalarTypeDI> &di_data, Teuchos::SerialDenseVector<OrdinalType, ScalarTypeDS> &ds_data, Teuchos::SerialDenseVector<OrdinalType, ScalarTypeDR> &dr_data)
    distributes incoming all vector in standard variable ordering among continuous, discrete int, discrete string, and discrete real vectors

- template<typename ScalarType>
  bool distribute (const std::vector<ScalarType> &all_data, std::vector<ScalarType> &c_data, std::vector<ScalarType> &di_data, std::vector<ScalarType> &ds_data, std::vector<ScalarType> &dr_data)
distributes incoming all array in standard variable ordering among continuous, discrete int, discrete string, and discrete real arrays

- bool distribute_list_of_points (const RealVector &list_of_pts)
  distributes list_of_pts coming from user spec among listCVPoints, listDIVPoints, listDSVPoints, and listDRVPoints

- void final_point_to_step_vector ()
  compute step vectors from finalPoint, initial points, and numSteps

- void distribute_partitions ()
  compute step vectors from \{cont, discInt, discString, discReal\} VarPartitions and global bounds

- bool check_num_steps (int num_steps)
  perform error checks on numSteps

- bool check_step_vector (const RealVector &step_vector)
  perform error checks on numSteps

- bool check_final_point (const RealVector &final_pt)
  perform error checks on finalPoint

- bool check_steps_per_variable (const IntVector &steps_per_var)
  perform error checks on stepsPerVariable

- bool check_variable_partitions (const UShortArray &partitions)
  perform error checks on variable partitions

- bool check_finite_bounds ()
  check for finite variable bounds within iteratedModel, as required for computing partitions of finite ranges

- bool check_ranges_sets (int num_steps)
  sanity check for vector parameter study

- bool check_ranges_sets (const IntVector &c_steps, const IntVector &di_steps, const IntVector &ds_steps, const IntVector &dr_steps)
  sanity check for centered parameter study

- bool check_sets (const IntVector &c_steps, const IntVector &di_steps, const IntVector &ds_steps, const IntVector &dr_steps)
  sanity check for increments along int/real set dimensions

- int integer_step (int range, int num_steps) const
  check for integer remainder and return step

- int index_step (size_t start, size_t end, int num_steps) const
  check for out of bounds and index remainder and return step

- void c_step (size_t c_index, int increment, Variables &vars)
  helper function for performing a continuous step in one variable

- void dri_step (size_t di_index, int increment, Variables &vars)
  helper function for performing a discrete step in an integer range variable

- void dsi_step (size_t di_index, int increment, const IntSet &values, Variables &vars)
  helper function for performing a discrete step in an integer set variable

- void dss_step (size_t ds_index, int increment, const StringSet &values, Variables &vars)
  helper function for performing a discrete step in a string set variable

- void dsr_step (size_t dr_index, int increment, const RealSet &values, Variables &vars)
  helper function for performing a discrete step in a real set variable

- void reset (Variables &vars)
reset vars to initial point (center)

- void centered_header (const String &type, size_t var_index, int step, size_t hdr_index)
  store a centered parameter study header within allHeaders

- void archive_allocate_cps () const
  specialized per-variable slice output for centered param study

- void archive_cps_vars (const Model &model, size_t idx) const
  specialized per-variable slice output for centered param study

- void archive_cps_resp (const Response &response, size_t idx) const
  specialized per-variable slice output for centered param study

- void index_to_var_step (const size_t study_idx, size_t &var_idx, size_t &step_idx) const
  map an overall parameter study (zero-based) evaluation index to the (zero-based) variable index (among all variables) and the (zero-based) step index within that variable

Private Attributes

- size_t numEvals
  total number of parameter study evaluations computed from specification

- RealVectorArray listCVPoints
  array of continuous evaluation points for the list_parameter_study

- IntVectorArray listDIVPoints
  array of discrete int evaluation points for the list_parameter_study

- StringMulti2DArray listDSVPoints
  array of discrete string evaluation points for the list_parameter_study

- RealVectorArray listDRVPoints
  array of discrete real evaluation points for the list_parameter_study

- RealVector initialCVPoint
  the continuous start point for vector and centered parameter studies

- IntVector initialDIVPoint
  the discrete int start point for vector and centered parameter studies

- StringMultiArray initialDSVPoint
  the discrete string start point for vector and centered parameter studies

- RealVector initialDRVPoint
  the discrete real start point for vector and centered parameter studies

- RealVector finalCVPoint
  the continuous ending point for vector_parameter_study

- IntVector finalDIVPoint
  the discrete int range value or set index ending point for vector_parameter_study

- IntVector finalDSVPoint
  the discrete string set index ending point for vector_parameter_study

- IntVector finalDRVPoint
  the discrete real set index ending point for vector_parameter_study

- RealVector contStepVector
  the n-dimensional continuous increment

- IntVector discIntStepVector
the n-dimensional discrete integer range value or set index increment

- IntVector discStringStepVector
  the n-dimensional discrete string set index increment

- IntVector discRealStepVector
  the n-dimensional discrete real set index increment

- int numSteps
  the number of times continuous/discrete step vectors are applied for vector parameter study (a specification option)

- IntVector stepsPerVariable
  number of offsets in the plus and the minus direction for each variable in a centered parameter study

- IntVector contStepsPerVariable
  number of offsets in the plus and the minus direction for each continuous variable in a centered parameter study

- IntVector discIntStepsPerVariable
  number of offsets in the plus and the minus direction for each discrete integer variable in a centered parameter study

- IntVector discStringStepsPerVariable
  number of offsets in the plus and the minus direction for each discrete string variable in a centered parameter study

- IntVector discRealStepsPerVariable
  number of offsets in the plus and the minus direction for each discrete real variable in a centered parameter study

- UShortArray contVarPartitions
  number of partitions for each continuous variable in a multidim parameter study

- UShortArray discIntVarPartitions
  number of partitions for each discrete integer variable in a multidim parameter study

- UShortArray discStringVarPartitions
  number of partitions for each discrete string variable in a multidim parameter study

- UShortArray discRealVarPartitions
  number of partitions for each discrete real variable in a multidim parameter study

Additional Inherited Members

13.163.1 Detailed Description

Class for vector, list, centered, and multidimensional parameter studies.

The ParamStudy class contains several algorithms for performing parameter studies of different types. The vector parameter study steps along an n-dimensional vector from an arbitrary initial point to an arbitrary final point in a specified number of steps. The centered parameter study performs a number of plus and minus offsets in each coordinate direction around a center point. A multidimensional parameter study fills an n-dimensional hypercube based on bounds and a specified number of partitions for each dimension. And the list parameter study provides for a user specification of a list of points to evaluate, which allows general parameter investigations not fitting the structure of vector, centered, or multidim parameter studies.

13.163.2 Member Function Documentation

void pre_run ( ) [virtual]

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori
pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent's `pre_run()`, if implemented, typically before performing its own implementation steps.

Reimplemented from `Analyzer`.

References Dakota::abort_handler(), SharedVariablesData::active_components_totals(), Analyzer::allHeaders, Analyzer::allVariables, ParamStudy::centered_loop(), Variables::continuous_variables(), ParamStudy::contStepsPerVariable, ParamStudy::contStepVector, ParamStudy::contVarPartitions, Dakota::copy_data(), Model::current_variables(), ParamStudy::discIntStepsPerVariable, ParamStudy::discIntStepVector, ParamStudy::discIntVarPartitions, ParamStudy::discRealStepsPerVariable, ParamStudy::discRealStepVector, ParamStudy::discRealVarPartitions, Variables::discrete_int_variables(), Variables::discrete_real_variables(), Variables::discrete_string_variables(), ParamStudy::discStringStepsPerVariable, ParamStudy::discStringStepVector, ParamStudy::discStringVarPartitions, ParamStudy::distribute_partitions(), ParamStudy::final_point_to_step_vector(), ParamStudy::finalCVPoint, ParamStudy::finalDIVPoint, ParamStudy::finalDRVPoint, ParamStudy::finalDSVPoint, ParamStudy::initialCVPoint, ParamStudy::initialDIVPoint, ParamStudy::initialDRVPoint, ParamStudy::initialDSVPoint, Iterator::iteratedModel, Iterator::method_enum_to_string(), Iterator::methodName, ParamStudy::multidim_loop(), Analyzer::numDiscreteStringVars, ParamStudy::numEvals, ParamStudy::numSteps, Iterator::outputLevel, Analyzer::pre_run(), ParamStudy::sample(), Variables::shared_data(), Dakota::svd(), ParamStudy::vector_loop(), and Dakota::write_ordered().

```cpp
void core_run() [virtual]
```
core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from `Iterator`.

References ParamStudy::archive_allocate_sets(), Analyzer::evaluate_parameter_sets(), Iterator::iteratedModel, Iterator::methodName, Analyzer::numLSqTerms, Analyzer::numObjFns, and Iterator::subIteratorFlag.

```cpp
void post_run (std::ostream & s) [virtual]
```
post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s `post_run()`, typically after performing its own implementation steps.

Reimplemented from `Analyzer`.

References ResultsManager::active(), Analyzer::allResponses, Analyzer::allVariables, SensAnalysisGlobal::archive_correlations(), SensAnalysisGlobal::compute_correlations(), Model::continuous_variable_labels(), Model::discrete_int_variable_labels(), Model::discrete_real_variable_labels(), Model::discrete_set_string_values(), Model::discrete_string_variable_labels(), Iterator::iteratedModel, Iterator::methodName, Analyzer::post_run(), PStudyDACE::pStudyDACESensGlobal, Model::response_labels(), Iterator::resultsDB, Iterator::run_identifier(), and Iterator::subIteratorFlag.

```cpp
bool load_distribute_points (const String & points_filename, unsigned short tabular_format, bool active_only) [private]
```
load list of points from data file and distribute among listCVPoints, listDIVPoints, listDSVPoints, and listDRVPoints

Load from file and distribute points; using this function to manage construction of the temporary arrays. Historically all data was read as a real (mixture of values and indices), but now points file is valued-based (reals, integers, strings) so file input matches tabular data output. Return false on success.
References Dakota::NPOS, Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Variables::copy(), Model::current_variables(), Model::discrete_int_lower_bounds(), Model::discrete_int_upper_bounds(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Model::discrete_set_string_values(), Iterator::iteratedModel, ParamStudy::listCVPoints, ParamStudy::listDIVPoints, ParamStudy::listDRVPoints, ParamStudy::listDSVPoints, Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, ParamStudy::numEvals, and Dakota::set_value_to_index().

Referenced by ParamStudy::ParamStudy().

bool distribute_list_of_points ( const RealVector &list_of_pts ) [private]
distributes list_of_pts coming from user spec among listCVPoints, listDIVPoints, listDSVPoints, and listDRVPoints

Parse list of points into typed data containers; list_of_pts will contain values for continuous and discrete integer range, but indices for all discrete set types (int, string, real)

References Dakota::abort_handler(), Model::discrete_int_sets(), Model::discrete_int_variable_labels(), Model::discrete_real_variable_labels(), Model::discrete_set_int_values(), Model::discrete_set_real_values(), Model::discrete_set_string_values(), Model::discrete_string_variable_labels(), ParamStudy::distribute(), Iterator::iteratedModel, ParamStudy::listCVPoints, ParamStudy::listDIVPoints, ParamStudy::listDRVPoints, ParamStudy::listDSVPoints, Iterator::method_id(), Analyzer::numContinuousVars, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, ParamStudy::numEvals, Dakota::set_index_to_value(), and Dakota::write_data().

Referenced by ParamStudy::ParamStudy().

13.163.3 Member Data Documentation

IntVector stepsPerVariable [private]
number of offsets in the plus and the minus direction for each variable in a centered parameter study

The per-type step arrays below could be made views into this, instead of duplicating, but if so, distribute() will not be allowed to resize the individual vectors.

Referenced by ParamStudy::check_steps_per_variable(), and ParamStudy::index_to_var_step().

13.166 PebbldBranching Class Reference

Main Branching class for the PEBBL-based Minimizer.
Inherits branching.

Public Member Functions

- PebbldBranching ()
  Default Constructor.
- ~PebbldBranching ()
  Destructor.
- pebbl::branchSub * blankSub ()
  Method that returns an empty Sub-Branch.
- void setModel (Model &model)
- void setIterator (Iterator &iterator)

Protected Attributes

- Model parentModel
  Original model, before branching.
- Iterator nlpSolver
  Solver to be used at root node.
- RealVector cont-vars
  Initial variable values for root node.
- RealVector lower_bounds
  Lower bounds for root node.
- RealVector upper_bounds
  Upper bounds for root node.
13.167. PEBBLDBRANCHSUB CLASS REFERENCE

Friends

- class PebbldBranchSub

13.166.1 Detailed Description

Main Branching class for the PEBBL-based Minimizer.

The documentation for this class was generated from the following files:

- PEBBLBranching.hpp
- PEBBLBranching.cpp

13.167 PebbldBranchSub Class Reference

Sub Branch class for the PEBBL-based Minimizer.
Inherits branchSub.

Public Member Functions

- PebbldBranchSub ()
  Constructor.
- ~PebbldBranchSub ()
  Destructor.
- PebbldBranching * global () const
  Returns a reference to the corresponding main Branching object.
- pebbl::branching * bGlobal () const
  Returns a reference to the corresponding main Branching object.
- void setGlobalInfo (PebbldBranching *global_)
  Method that sets up the main Branching object.
- void setRootComputation ()
  Method that is called when declaring the current node as a root node.
- void boundComputation (double *controlParam)
  Method that does the Bounding Operation. In other words, it calls the optimization algorithm on the relaxed domain.
- bool candidateSolution ()
  Method called after the bounding operation, returns true if the bounding resulted in a possible solution to the original non-relaxed problem.
- pebbl::solution * extractSolution ()
  Method that returns a PEBBL-based solution.
- int splitComputation ()
  Method that determines how many branches are created and how. Returns the number of branches created from this object.
- pebbl::branchSub * makeChild (int whichChild)
  Method that returns a new PebbldBranchSub object based on Objective Function improvements and the number of branches.
- void pebbldSubAsChildOf (PebbldBranchSub *parent, int splitVar, int whichChild, std::vector< double > _candidate_x, RealVector _lower_bounds, RealVector _upper_bounds)
  Method that creates a new PebbldBranching object.
Protected Attributes

- **PebbldBranching * globalPtr**  
  Pointer referring to all info passed to subproblem.
- **Model subModel**  
  Model used for sub-problem.
- **Iterator subNLPSolver**  
  Solver used for sub-problems.
- **std::vector<double> candidate**  
  Candidate solution after solving sub-problem (also the bound)
- **double candidate_objFn**  
  Objective value at the candidate solution.
- **int splitVar**  
  Variable to branch on.
- **RealVector cont_vars**  
  Initial variable values for sub-problem.
- **RealVector lower_bounds**  
  Lower bounds for sub-problem.
- **RealVector upper_bounds**  
  Upper bounds for sub-problem.

Friends

- **~PecosApproximation ()**
CHAPTER 13. CLASS DOCUMENTATION

destructor

- void expansion_coefficient_flag (bool coeff_flag)
  set pecosBasisApprox.configOptions.expansionCoeffFlag

- bool expansion_coefficient_flag () const
  get pecosBasisApprox.configOptions.expansionCoeffFlag

- void expansion_gradient_flag (bool grad_flag)
  set pecosBasisApprox.configOptions.expansionGradFlag

- bool expansion_gradient_flag () const
  get pecosBasisApprox.configOptions.expansionGradFlag

- void compute_component_effects ()
  Performs global sensitivity analysis using Sobol' Indices by computing component (main and interaction) effects.

- void compute_total_effects ()
  Performs global sensitivity analysis using Sobol' Indices by computing total effects.

- const Pecos::RealVector & sobol_indices () const
  return polyApproxRep->sobolIndices

- const Pecos::RealVector & total_sobol_indices () const
  return polyApproxRep->totalSobolIndices

- size_t sparsity () const
  return the number of non-zero coefficients for this QoI

- Pecos::ULongULongMap sparse_sobol_index_map () const
  return RegressOrthogPolyApproximation::sparseSobolIndexMap

- const Pecos::RealVector & dimension_decay_rates () const
  return OrthogPolyApproximation::decayRates

- void allocate_arrays ()
  invoke Pecos::PolynomialApproximation::allocate_arrays()

- void initialize_covariance (PecosApproximation *pecos_approx_2)
  initialize covariance accumulators with pointers to other QoI

- void clear_covariance_pointers ()
  clear covariance pointers to other QoI

- void initialize_products ()
  initialize covariance accumulators (also reinitialize after change in stats type)

- bool product_interpolants ()
  query whether product interpolants are defined (non-empty)

- Real mean ()
  return the mean of the expansion, where all active variables are random

- Real mean (const Pecos::RealVector &x)
  return the mean of the expansion for a given parameter vector, where a subset of the active variables are random

- const Pecos::RealVector & mean_gradient ()
  return the gradient of the expansion mean for a given parameter vector, where all active variables are random

- const Pecos::RealVector & mean_gradient (const Pecos::RealVector &x, const Pecos::SizetArray &dvv)
  return the gradient of the expansion mean for a given parameter vector and given DVV, where a subset of the active variables are random

- Real variance ()
return the variance of the expansion, where all active vars are random

- Real variance (const Pecos::RealVector &x)
  return the variance of the expansion for a given parameter vector, where a subset of the active variables are random
- const Pecos::RealVector & variance_gradient ()
  return the gradient of the expansion variance for a given parameter vector, where all active variables are random
- const Pecos::RealVector & variance_gradient (const Pecos::RealVector &x, const Pecos::SizetArray &dvv)
  return the gradient of the expansion variance for a given parameter vector and given DVV, where a subset of the active variables are random

- Real covariance (PecosApproximation *pecos_approx)
  return the covariance between two response expansions, treating all variables as random
- Real covariance (const Pecos::RealVector &x, PecosApproximation *pecos_approx)
  return the covariance between two response expansions, treating a subset of the variables as random
- Real combined_covariance (PecosApproximation *pecos_approx)
  return the covariance between two combined response expansions, where all active variables are random
- Real combined_covariance (const Pecos::RealVector &x, PecosApproximation *pecos_approx)
  return the covariance between two combined response expansions, where a subset of the active variables are random

- Real beta (bool cdf_flag, Real z_bar)
  return the reliability index (mapped from z_bar), where all active variables are random
- Real beta (const RealVector &x, bool cdf_flag, Real z_bar)
  return the reliability index (mapped from z_bar), treating a subset of variables as random
- Real combined_beta (bool cdf_flag, Real z_bar)
  return the reliability index (mapped from z_bar), where all active variables are random
- Real combined_beta (const RealVector &x, bool cdf_flag, Real z_bar)
  return the reliability index (mapped from z_bar), treating a subset of variables as random

- Real delta_mean ()
  return the change in mean resulting from expansion refinement, where all active variables are random
- Real delta_mean (const RealVector &x)
  return the change in mean resulting from expansion refinement, treating a subset of variables as random
- Real combined_mean ()
  return the change in mean resulting from combined expansion refinement, where all active variables are random
- Real combined_mean (const RealVector &x)
  return the change in mean resulting from combined expansion refinement, treating a subset of variables as random

- Real delta_std_deviation ()
  return the change in standard deviation resulting from expansion refinement, where all active variables are random
- Real delta_std_deviation (const RealVector &x)
  return the change in standard deviation resulting from expansion refinement, treating a subset of variables as random
- Real combined_std_deviation ()
  return the change in standard deviation resulting from combined expansion refinement, where all active variables are random
- Real combined_std_deviation (const RealVector &x)
  return the change in standard deviation resulting from combined expansion refinement, treating a subset of variables as random
• Real delta_variance ()
  return the change in variance resulting from expansion refinement, where all active variables are random
• Real delta_variance (const RealVector &x)
  return the change in variance resulting from expansion refinement, treating a subset of variables as random
• Real delta_combined_variance ()
  return the change in variance resulting from combined expansion refinement, where all active variables are random
• Real delta_combined_variance (const RealVector &x)
  return the change in variance resulting from combined expansion refinement, treating a subset of variables as random
• Real delta_covariance (PecosApproximation *pecos_approx_2)
  return the change in covariance resulting from expansion refinement, where all active variables are random
• Real delta_covariance (const Pecos::RealVector &x, PecosApproximation *pecos_approx_2)
  return the change in covariance resulting from expansion refinement, treating a subset of the active variables as random
• Real delta_combined_covariance (PecosApproximation *pecos_approx_2)
  return the change in covariance resulting from expansion refinement, where all active variables are random
• Real delta_combined_covariance (const Pecos::RealVector &x, PecosApproximation *pecos_approx_2)
  return the change in covariance resulting from expansion refinement, treating a subset of the active variables as random
• Real delta_beta (bool cdf_flag, Real z_bar)
  return the change in reliability index (mapped from z_bar) resulting from expansion refinement, where all active variables are random
• Real delta_beta (const RealVector &x, bool cdf_flag, Real z_bar)
  return the change in reliability index (mapped from z_bar) resulting from expansion refinement, treating a subset of variables as random
• Real delta_combined_beta (bool cdf_flag, Real z_bar)
  return the change in reliability index (mapped from z_bar) resulting from expansion refinement, where all active variables are random
• Real delta_combined_beta (const RealVector &x, bool cdf_flag, Real z_bar)
  return the change in reliability index (mapped from z_bar) resulting from expansion refinement, treating a subset of variables as random
• Real delta_z (bool cdf_flag, Real beta_bar)
  return the change in response level (mapped from beta_bar) resulting from expansion refinement, where all active variables are random
• Real delta_z (const RealVector &x, bool cdf_flag, Real beta_bar)
  return the change in response level (mapped from beta_bar) resulting from expansion refinement, where a subset of the active variables are random
• Real delta_combined_z (bool cdf_flag, Real beta_bar)
  return the change in response level (mapped from beta_bar) resulting from expansion refinement, where all active variables are random
• Real delta_combined_z (const RealVector &x, bool cdf_flag, Real beta_bar)
  return the change in response level (mapped from beta_bar) resulting from expansion refinement, where a subset of the active variables are random
• void compute_moments (bool full_stats=true, bool combined_stats=false)
  compute moments up to the order supported by the Pecos polynomial approximation
void compute_moments (const Pecos::RealVector &x, bool full_stats=true, bool combined_stats=false)
  compute moments in all-variables mode up to the order supported by the Pecos polynomial approximation

const RealVector & moments () const
  return Pecos::PolynomialApproximation::moments()

void moments (const RealVector &mom)
  set Pecos::PolynomialApproximation::moments()

Real moment (size_t i) const
  return Pecos::PolynomialApproximation::moment(i)

void moment (Real mom, size_t i)
  set Pecos::PolynomialApproximation::moment(i)

const RealVector & expansion_moments () const
  return Pecos::PolynomialApproximation::expansionMoments

const RealVector & numerical_integration_moments () const
  return Pecos::PolynomialApproximation::numericalMoments

void standardize_moments (const Pecos::RealVector &central_moments, Pecos::RealVector &std_moments)
  standardize the central moments returned from Pecos

void clear_computed_bits ()
  clear tracking of computed moments, due to a change that invalidates previous results

void build_linear_system (RealMatrix &A, const UShort2DArray &multi_index)
  construct the Vandermonde matrix "A" for PCE regression for Ax = b

void augment_linear_system (const RealVectorArray &samples, RealMatrix &A, const UShort2DArray &multi_index)

Pecos::BasisApproximation & pecos_basis_approximation ()
  return pecosBasisApprox

Protected Member Functions

Real value (const Variables &vars)
  retrieve the approximate function value for a given parameter vector

const Pecos::RealVector & gradient (const Variables &vars)
  retrieve the approximate function gradient for a given parameter vector

const Pecos::RealSymMatrix & hessian (const Variables &vars)
  retrieve the approximate function Hessian for a given parameter vector

int min_coefficients () const
  return the minimum number of samples (unknowns) required to build the derived class approximation type in num-Vars dimensions

void build ()
  builds the approximation from scratch

void rebuild ()
  rebuilds the approximation incrementally

void pop_coefficients (bool save_data)
  removes entries from end of SurrogateData::{vars,resp}Data (last points appended, or as specified in args)

void push_coefficients ()
  restores state prior to previous pop()
void finalize_coefficients ()

finalize approximation by applying all remaining trial sets

void combine_coefficients ()

combine all level approximations into a single aggregate approximation

void combined_to_active_coefficients (bool clear_combined=true)

promote combined approximation into active approximation

void clear_inactive_coefficients ()

prune inactive coefficients following combination and promotion to active

void print_coefficients (std::ostream &s, bool normalized)

print the coefficient array computed in build()/rebuild()

RealVector approximation_coefficients (bool normalized) const

return expansion coefficients in a form consistent with the shared multi-index

void approximation_coefficients (const RealVector &approx_coeffs, bool normalized)

set expansion coefficients in a form consistent with the shared multi-index

void link_multilevel_surrogate_data ()

link more than once approxData instance for aggregated response data (PecosApproximation)

void coefficient_labels (std::vector<std::string> &coeff_labels) const

print the coefficient array computed in build()/rebuild()

Private Member Functions

void approx_type_to_basis_type (const String &approx_type, short &basis_type)

utility to convert Dakota type string to Pecos type enumeration

Private Attributes

Pecos::BasisApproximation pecosBasisApprox

the Pecos basis approximation, encompassing orthogonal and interpolation polynomial approximations

Pecos::PolynomialApproximation * polyApproxRep

convenience pointer to representation of Pecos polynomial approximation

Additional Inherited Members

13.169.1 Detailed Description

Derived approximation class for global basis polynomials.

The PecosApproximation class provides a global approximation based on basis polynomials. This includes orthogonal polynomials used for polynomial chaos expansions and interpolation polynomials used for stochastic collocation.
13.169.2 Member Function Documentation

void build() [inline], [protected], [virtual]

builds the approximation from scratch

This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.

Reimplemented from Approximation.

References Approximation::approxData, Approximation::check_points(), and PecosApproximation::pecosBasis-Approx.

The documentation for this class was generated from the following files:

- PecosApproximation.hpp
- PecosApproximation.cpp

13.170 PrefixingLineFilter Class Reference

Inherits line_filter.

Public Member Functions

- PrefixingLineFilter (const std::string &prefix_in)
  
  Constructor.

Private Member Functions

- std::string do_filter (const std::string &line)
  
  "Filter" the line by adding the prefix

Private Attributes

- std::string linePrefix
  
  Prefix for each line.

13.170.1 Detailed Description

PrefixingLineFilter is derived from a Boost stream filter class in order to preface output with specified text. In this case, the intent is to distinguish ROL output.

The documentation for this class was generated from the following file:

- ROLOptimizer.hpp

13.171 ProbabilityTransformModel Class Reference

Probability transformation specialization of RecastModel.

Inheritance diagram for ProbabilityTransformModel:
CHAPTER 13. CLASS DOCUMENTATION

ProbabilityTransformModel

RecastModel

Model

Public Member Functions

- void **initialize_random_variable_parameters** ()
  
  *initializes ranVarMeansX, ranVarStdDevsX, ranVarLowerBndsX, ranVarUpperBndsX, and ranVarAddtlParamsX within natafTransform*

- void **initialize_random_variable_correlations** ()
  
  *propagate iteratedModel correlations to natafTransform*

- void **verify_correlation_support** (short u_space_type)
  
  *verify that correlation warping is supported by Nataf for given variable types*
void transform_model (bool truncated_bounds, Real bound)
    recast x-model from x-space to u-space to create u_model

unsigned short pecos_to_dakota_variable_type (unsigned short pecos_var_type)
    convert from Pecos To Dakota variable enumeration type for continuous aleatory uncertain variables used in variable transformations

void initialize_sizes ()

Static Protected Member Functions

static void vars_u_to_x_mapping (const Variables &u_vars, Variables &x_vars)
    static function for RecastModels used for forward mapping of u-space variables from NonD Iterators to x-space variables for Model evaluations

static void vars_x_to_u_mapping (const Variables &x_vars, Variables &u_vars)
    static function for RecastModels used for inverse mapping of x-space variables from data import to u-space variables for NonD Iterators

static void set_u_to_x_mapping (const Variables &u_vars, const ActiveSet &u_set, ActiveSet &x_set)
    static function for RecastModels used to map u-space ActiveSets from NonD Iterators to x-space ActiveSets for Model evaluations

static void resp_x_to_u_mapping (const Variables &x_vars, const Variables &u_vars, const Response &x_response, Response &u_response)
    static function for RecastModels used to map x-space responses from Model evaluations to u-space responses for return to NonD Iterator.

Private Attributes

Pecos::ProbabilityTransformation natafTransform
    Nonlinear variable transformation that encapsulates the required data for performing transformations from X -> Z -> U and back.

size_t numContinuousVars
    number of active continuous vars

size_t numDiscreteIntVars
    number of active discrete integer vars

size_t numDiscreteStringVars
    number of active discrete string vars

size_t numDiscreteRealVars
    number of active discrete real vars

size_t numContDesVars
    number of continuous design variables (modeled using uniform distribution for All view modes)

size_t numDiscIntDesVars
    number of discrete integer design variables (modeled using discrete histogram distributions for All view modes)

size_t numDiscStringDesVars
    number of discrete string design variables (modeled using discrete histogram distributions for All view modes)

size_t numDiscRealDesVars
    number of discrete real design variables (modeled using discrete histogram distributions for All view modes)

size_t numDesignVars
CHAPTER 13. CLASS DOCUMENTATION

- total number of design variables
  - `size_t numContStateVars`
    number of continuous state variables (modeled using uniform distribution for All view modes)
  - `size_t numDiscIntStateVars`
    number of discrete integer state variables (modeled using discrete histogram distributions for All view modes)
  - `size_t numDiscStringStateVars`
    number of discrete string state variables (modeled using discrete histogram distributions for All view modes)
  - `size_t numDiscRealStateVars`
    number of discrete real state variables (modeled using discrete histogram distributions for All view modes)
  - `size_t numStateVars`
    total number of state variables
  - `size_t numNormalVars`
    number of normal uncertain variables (native space)
  - `size_t numLognormalVars`
    number of lognormal uncertain variables (native space)
  - `size_t numUniformVars`
    number of uniform uncertain variables (native space)
  - `size_t numLoguniformVars`
    number of loguniform uncertain variables (native space)
  - `size_t numTriangularVars`
    number of triangular uncertain variables (native space)
  - `size_t numExponentialVars`
    number of exponential uncertain variables (native space)
  - `size_t numBetaVars`
    number of beta uncertain variables (native space)
  - `size_t numGammaVars`
    number of gamma uncertain variables (native space)
  - `size_t numGumbelVars`
    number of gumbel uncertain variables (native space)
  - `size_t numFrechetVars`
    number of frechet uncertain variables (native space)
  - `size_t numWeibullVars`
    number of weibull uncertain variables (native space)
  - `size_t numHistogramBinVars`
    number of histogram bin uncertain variables (native space)
  - `size_t numPoissonVars`
    number of Poisson uncertain variables (native space)
  - `size_t numBinomialVars`
    number of binomial uncertain variables (native space)
  - `size_t numNegBinomialVars`
    number of negative binomial uncertain variables (native space)
  - `size_t numGeometricVars`
    number of geometric uncertain variables (native space)
- size_t numHyperGeomVars
  number of hypergeometric uncertain variables (native space)
- size_t numHistogramPtIntVars
  number of histogram point integer uncertain variables (native space)
- size_t numHistogramPtStringVars
  number of histogram point string uncertain variables (native space)
- size_t numHistogramPtRealVars
  number of histogram point real uncertain variables (native space)
- size_t numContIntervalVars
  number of continuous interval uncertain variables (native space)
- size_t numDiscIntervalVars
  number of discrete interval uncertain variables (native space)
- size_t numDiscSetIntUncVars
  number of discrete integer set uncertain variables (native space)
- size_t numDiscSetStringUncVars
  number of discrete string set uncertain variables (native space)
- size_t numDiscSetRealUncVars
  number of discrete real set uncertain variables (native space)
- size_t numContAleatUncVars
  total number of continuous aleatory uncertain variables (native space)
- size_t numDiscIntAleatUncVars
  total number of discrete integer aleatory uncertain variables (native space)
- size_t numDiscStringAleatUncVars
  total number of discrete string aleatory uncertain variables (native space)
- size_t numDiscRealAleatUncVars
  total number of discrete real aleatory uncertain variables (native space)
- size_t numAleatoryUncVars
  total number of aleatory uncertain variables (native space)
- size_t numContEpistUncVars
  total number of continuous epistemic uncertain variables (native space)
- size_t numDiscIntEpistUncVars
  total number of discrete integer epistemic uncertain variables (native space)
- size_t numDiscStringEpistUncVars
  total number of discrete string epistemic uncertain variables (native space)
- size_t numDiscRealEpistUncVars
  total number of discrete real epistemic uncertain variables (native space)
- size_t numEpistemicUncVars
  total number of epistemic uncertain variables (native space)
- size_t numUncertainVars
  total number of uncertain variables (native space)
- bool distParamDerivs
  flags calculation of derivatives with respect to distribution parameters s within resp
  to u mapping() using the chain rule df/dx dx/ds. The default is to calculate derivatives
  with respect to standard random variables u using the chain rule df/dx dx/du.
• bool truncatedBounds
  
  boolean flag to indicate truncated bounds

• Real boundVal
  
  bound value

• bool epistemicStats

  flag for computing interval-type metrics instead of integrated metrics If any epistemic variables are active in a 
  metric evaluation, then this flag is set.

• SizetArray primaryACVarMapIndices

  "primary" all continuous variable mapping indices flowed down from higher level iteration

• ShortArray secondaryACVarMapTargets

  "secondary" all continuous variable mapping targets flowed down from higher level iteration

• bool mappingInitialized

  track use of initialize_mapping() and finalize_mapping()

Static Private Attributes

• static ProbabilityTransformModel * ptmInstance

  static pointer to this class for use in static callbacks

Additional Inherited Members

13.171.1 Detailed Description

Probability transformation specialization of RecastModel.

Specialization of RecastModel to transform a sub-model to u-space.

13.171.2 Member Function Documentation

void initialize_random_variables ( const Pecos::ProbabilityTransformation & transform, bool deep_copy = false ) [protected]

alternate form: initialize natafTransform based on incoming data

This function is commonly used to publish transformation data when the Model variables are in a transformed 
space (e.g., u-space) and ProbabilityTransformation::ranVarTypes et al. may not be generated directly. This allows 
for the use of inverse transformations to return the transformed space variables to their original states.

References ProbabilityTransformModel::initialize_random_variable_transformation(), ProbabilityTransform-
Model::natafTransform, ProbabilityTransformModel::numContDesVars, ProbabilityTransformModel::numCont-
EpistUncVars, ProbabilityTransformModel::numContIntervalVars, and ProbabilityTransformModel::numContState-
Vars.

void initialize_random_variable_types ( ) [protected]

initializes ranVarTypesX within natafTransform (u-space not needed)

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their 
corresponding means.standard deviations. This function is used when the Model variables are in x-space.

References Model::aleatory_distribution_parameters(), Model::cv(), ProbabilityTransformModel::natafTransform,
ProbabilityTransformModel::numBetaVars, ProbabilityTransformModel::numBinomialVars, ProbabilityTransform-
Model::numContDesVars, ProbabilityTransformModel::numContIntervalVars, ProbabilityTransformModel::num-
ContStateVars, ProbabilityTransformModel::numExponentialVars, ProbabilityTransformModel::numFrechetVars,

Referenced by ProbabilityTransformModel::ProbabilityTransformModel().

```cpp
void initialize_random_variable_types ( short u_space_type ) [protected]
```

initializes ranVarTypesX and ranVarTypesU within natafTransform

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

Referenced by ProbabilityTransformModel::initialize_mapping().

```cpp
void initialize_random_variable_parameters ( ) [protected]
```

initializes ranVarMeansX, ranVarStdDevsX, ranVarLowerBndsX, ranVarUpperBndsX, and ranVarAddtlParamsX within natafTransform

Build ProbabilityTransformation::ranVar arrays containing the uncertain variable distribution types and their corresponding means/standard deviations. This function is used when the Model variables are in x-space.

References Model::aleatory_distribution_parameters(), Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::epistemic_distribution_parameters(), ProbabilityTransformModel::natafTransform, ProbabilityTransformModel::numAleatoryUncVars, ProbabilityTransformModel::numContDesVars, ProbabilityTransformModel::numContIntervalVars, ProbabilityTransformModel::numContStateVars, ProbabilityTransformModel::numEpistemicUncVars, and RecastModel::subModel.

Referenced by ProbabilityTransformModel::initialize_mapping().

```cpp
void vars_u_to_x_mapping ( const Variables & u_vars, Variables & x_vars ) [inline], [static], [protected]
```

static function for RecastModels used for forward mapping of u-space variables from NonD Iterators to x-space variables for Model evaluations

Map the variables from iterator space (u) to simulation space (x).

References Variables::continuous_variables(), Variables::continuous_variables_view(), ProbabilityTransformModel::natafTransform, and ProbabilityTransformModel::ptmInstance.

Referenced by ProbabilityTransformModel::ProbabilityTransformModel().
void vars_x_to_u_mapping ( const Variables & x_vars, Variables & u_vars ) [inline], [static], [protected]

static function for RecastModels used for inverse mapping of x-space variables from data import to u-space variables for NonD Iterators
  Map the variables from simulation space (x) to iterator space (u).
  References Variables::continuous_variables(), Variables::continuous_variables_view(), ProbabilityTransformModel::natafTransform, and ProbabilityTransformModel::ptmInstance.
  Referenced by ProbabilityTransformModel::ProbabilityTransformModel().

void set_u_to_x_mapping ( const Variables & u_vars, const ActiveSet & u_set, ActiveSet & x_set ) [static], [protected]

static function for RecastModels used to map u-space ActiveSets from NonD Iterators to x-space ActiveSets for Model evaluations
  Define the DVV for x-space derivative evaluations by augmenting the iterator requests to account for correlations.
  References Dakota::NPOS, Variables::all_continuous_variable_ids(), Dakota::contains(), Variables::continuous_variable_ids(), ActiveSet::derivative_vector(), Dakota::find_index(), Variables::inactive_continuous_variable_ids(), ProbabilityTransformModel::natafTransform, and ProbabilityTransformModel::ptmInstance.
  Referenced by ProbabilityTransformModel::ProbabilityTransformModel().

13.171.3 Member Data Documentation

ProbabilityTransformModel ∗ ptmInstance [static], [private]

static pointer to this class for use in static callbacks
  initialization of static needed by RecastModel
  Referenced by ProbabilityTransformModel::ProbabilityTransformModel(), ProbabilityTransformModel::resp_x_to_u_mapping(), ProbabilityTransformModel::set_u_to_x_mapping(), ProbabilityTransformModel::vars_u_to_x_mapping(), and ProbabilityTransformModel::vars_x_to_u_mapping().
  The documentation for this class was generated from the following files:
  - ProbabilityTransformModel.hpp
  - ProbabilityTransformModel.cpp

13.172 ProblemDescDB Class Reference

The database containing information parsed from the DAKOTA input file.
  Inheritance diagram for ProblemDescDB:

```
ProblemDescDB
    NIDRProblemDescDB
```
Public Member Functions

- **ProblemDescDB ()**
  *default constructor*
- **ProblemDescDB (ParallelLibrary &parallel_lib)**
  *standard constructor*
- **ProblemDescDB (const ProblemDescDB &db)**
  *copy constructor*
- **~ProblemDescDB ()**
  *destructor*
- **ProblemDescDB operator= (const ProblemDescDB &db)**
  *assignment operator*
- **void parse_input (ProgramOptions &prog_opts, DbCallbackFunctionPtr callback=NULL, void *callback_data=NULL)**
  Parses the input file or input string if present and executes callbacks. Does not perform any validation.
- **void check_and_broadcast (const ProgramOptions &prog_opts)**
  *performs check_input, broadcast, and post_process, but for now, allowing separate invocation through the public API as well*
- **void check_input ()**
  *verifies that there is at least one of each of the required keywords in the dakota input file*
- **void broadcast ()**
  *invokes send_db_buffer() and receive_db_buffer() to broadcast DB data across the processor allocation. Used by manage_inputs().*
- **void post_process ()**
  *post-processes the (minimal) input specification to assign default variables/responses specification arrays. Used by manage_inputs().*
- **void lock ()**
  *locks the database in order to prevent data access when the list nodes may not be set properly. Unlocked by a set nodes operation.*
- **void unlock ()**
  *Explicitly unlocks the database. Use with care.*
- **void set_db_list_nodes (const String &method_tag)**
  *set dataMethodIter based on a method identifier string to activate a particular method specification in dataMethodList and use pointers from this method specification to set all other list iterators.*
- **void set_db_list_nodes (size_t method_index)**
  *set dataMethodIter based on an index within dataMethodList to activate a particular method specification and use pointers from this method specification to set all other list iterators.*
- **void resolve_top_method (bool set_model_nodes=true)**
  *For a (default) environment lacking a top method pointer, this function is used to determine which of several potential method specifications corresponds to the top method and then sets the list nodes accordingly.*
- **void set_db_method_node (const String &method_tag)**
  *set dataMethodIter based on a method identifier string to activate a particular method specification (only).*
- **void set_db_method_node (size_t method_index)**
  *set dataMethodIter based on an index within dataMethodList to activate a particular method specification (only).*
- **size_t get_db_method_node ()**
return the index of the active node in dataMethodList

- void set_db_model_nodes (const String &model_tag)
  set the model list iterators (dataModelIter, dataVariablesIter, dataInterfaceIter, and dataResponsesIter) based on
  the model identifier string

- void set_db_model_nodes (size_t model_index)
  set the model list iterators (dataModelIter, dataVariablesIter, dataInterfaceIter, and dataResponsesIter) based on
  an index within dataModelList

- size_t get_db_model_node ()
  return the index of the active node in dataModelList

- void set_db_variables_node (const String &variables_tag)
  set dataVariablesIter based on the variables identifier string

- void set_db_interface_node (const String &interface_tag)
  set dataInterfaceIter based on the interface identifier string

- void set_db_responses_node (const String &responses_tag)
  set dataResponsesIter based on the responses identifier string

- ParallelLibrary & parallel_library () const
  return the parallelLib reference

- IteratorList & iterator_list ()
  return a list of all Iterator objects that have been instantiated

- ModelList & model_list ()
  return a list of all Model objects that have been instantiated

- VariablesList & variables_list ()
  return a list of all Variables objects that have been instantiated

- InterfaceList & interface_list ()
  return a list of all Interface objects that have been instantiated

- ResponseList & response_list ()
  return a list of all Response objects that have been instantiated

- const RealMatrixArray & get_rma (const String &entry_name) const
  get a RealMatrixArray out of the database based on an identifier string

- const RealVector & get_rv (const String &entry_name) const
  get a RealVector out of the database based on an identifier string

- const IntVector & get_iv (const String &entry_name) const
  get an IntVector out of the database based on an identifier string

- const BitArray & get_ba (const String &entry_name) const
  get a BitArray out of the database based on an identifier string

- const SizetArray & get_sza (const String &entry_name) const
  get a SizetArray out of the database based on an identifier string

- const UShortArray & get_usa (const String &entry_name) const

- const RealSymMatrix & get_rsm (const String &entry_name) const
  get a RealSymMatrix out of the database based on an identifier string

- const RealVectorArray & get_rva (const String &entry_name) const
  get a RealVectorArray out of the database based on an identifier string
• const IntVectorArray & get_iva (const String &entry_name) const
  get an IntVectorArray out of the database based on an identifier string
• const IntSet & get_is (const String &entry_name) const
  get an IntSet out of the database based on an identifier string
• const IntSetArray & get_isa (const String &entry_name) const
  get an IntSetArray out of the database based on an identifier string
• const StringSetArray & get_ssa (const String &entry_name) const
  get an StringSetArray out of the database based on an identifier string
• const RealSetArray & get_rsa (const String &entry_name) const
  get a RealSetArray out of the database based on an identifier string
• const IntRealMapArray & get_irma (const String &entry_name) const
  get an IntRealMapArray out of the database based on an identifier string
• const StringRealMapArray & get_srma (const String &entry_name) const
  get an StringRealMapArray out of the database based on an identifier string
• const RealRealMapArray & get_rrma (const String &entry_name) const
  get a RealRealMapArray out of the database based on an identifier string
• const RealRealPairRealMapArray & get_rrrma (const String &entry_name) const
  get a RealRealPairRealMapArray out of the database based on an identifier string
• const IntIntPairRealMapArray & get_iirma (const String &entry_name) const
  get an IntIntPairRealMapArray out of the database based on an identifier string
• const StringArray & get_sa (const String &entry_name) const
  get a StringArray out of the database based on an identifier string
• const String2DArray & get_s2a (const String &entry_name) const
  get a String2DArray out of the database based on an identifier string
• const String & get_string (const String &entry_name) const
  get a String out of the database based on an identifier string
• const Real & get_real (const String &entry_name) const
  get a Real out of the database based on an identifier string
• int get_int (const String &entry_name) const
  get an int out of the database based on an identifier string
• short get_short (const String &entry_name) const
  get a short out of the database based on an identifier string
• unsigned short get_ushort (const String &entry_name) const
  get an unsigned short out of the database based on an identifier string
• size_t get_sizet (const String &entry_name) const
  get a size_t out of the database based on an identifier string
• bool get_bool (const String &entry_name) const
  get a bool out of the database based on an identifier string
• void ** get Voidss (const String &entry_name) const
  for getting a void**., e.g., &dlLib
• void insert_node (const DataEnvironment &data_env)
  set the DataEnvironment object
• void insert_node (const DataMethod &data_method)
add a DataMethod object to the dataMethodList

- void insert_node (const DataModel &data_model)
  
  add a DataModel object to the dataModelList

- void insert_node (DataVariables &data_variables)
  
  add a DataVariables object to the dataVariablesList

- void insert_node (const DataInterface &data_interface)
  
  add a DataInterface object to the dataInterfaceList

- void insert_node (const DataResponses &data_responses)
  
  add a DataResponses object to the dataResponsesList

- void set (const String &entry_name, const RealVector &rv)
  
  set a RealVector within the database based on an identifier string

- void set (const String &entry_name, const IntVector &iv)
  
  set an IntVector within the database based on an identifier string

- void set (const String &entry_name, const BitArray &ba)
  
  set a BitArray within the database based on an identifier string

- void set (const String &entry_name, const RealSymMatrix &rsm)
  
  set a RealSymMatrix within the database based on an identifier string

- void set (const String &entry_name, const RealVectorArray &rva)
  
  set a RealVectorArray within the database based on an identifier string

- void set (const String &entry_name, const IntVectorArray &iva)
  
  set an IntVectorArray within the database based on an identifier string

- void set (const String &entry_name, const IntSetArray &isa)
  
  set an IntSetArray within the database based on an identifier string

- void set (const String &entry_name, const RealSetArray &rsa)
  
  set a RealSetArray within the database based on an identifier string

- void set (const String &entry_name, const IntRealMapArray &irma)
  
  set an IntRealMapArray within the database based on an identifier string

- void set (const String &entry_name, const StringRealMapArray &srma)
  
  set a StringRealMapArray within the database based on an identifier string

- void set (const String &entry_name, const RealRealMapArray &rrma)
  
  set a RealRealMapArray within the database based on an identifier string

- void set (const String &entry_name, const RealRealPairRealMapArray &iirma)
  
  set a RealRealPairRealMapArray in the db based on an identifier string

- void set (const String &entry_name, const IntIntPairRealMapArray &iirma)
  
  set an IntIntPairRealMapArray in the db based on an identifier string

- void set (const String &entry_name, const StringArray &sa)
  
  set a StringArray within the database based on an identifier string

- int min_procs_per_ea ()
  
  compute minimum evaluation partition size based on lower level overrides

- int max_procs_per_ea ()
  
  compute maximum evaluation partition size based on lower level overrides and concurrency levels

- int min_procs_per_ie ()
  
  compute minimum iterator partition size based on lower level overrides
13.172. PROBLEMDESCDB CLASS REFERENCE

- **int max_procs_per_ie** (int max_eval_concurrency)
  
  compute maximum iterator partition size based on lower level overrides and concurrency levels

  return methodDBLocked

- **bool model_locked () const**
  
  return modelDBLocked

- **bool variables_locked () const**
  
  return variablesDBLocked

- **bool interface_locked () const**
  
  return interfaceDBLocked

- **bool responses_locked () const**
  
  return responsesDBLocked

- **bool is_null () const**
  
  function to check dbRep (does this envelope contain a letter)

**Static Public Member Functions**

- **static int min_procs_per_level** (int min_procs_per_server, int pps_spec, int num_serv_spec)
  
  compute minimum partition size for a parallel level based on lower level overrides

- **static int max_procs_per_level** (int max_procs_per_server, int pps_spec, int num_serv_spec, short sched_spec, int asynch_local_cone, bool peer_dynamic_avail, int max_concurrency)
  
  compute maximum partition size for a parallel level based on lower level overrides

**Protected Member Functions**

- **ProblemDescDB (BaseConstructor, ParallelLibrary &parallel_lib)**
  
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- **virtual void derived_parse_inputs (const ProgramOptions &prog_opts)**
  
  derived class specifics within parse_inputs()

- **virtual void derived_broadcast ()**
  
  derived class specifics within broadcast()

- **virtual void derived_post_process ()**
  
  derived class specifics within post_process()

**Protected Attributes**

- **DataEnvironment environmentSpec**
  
  the environment specification (only one allowed) resulting from a call to environment_kwhandler() or insert_node()

- **std::list< DataMethod > dataMethodList**
  
  list of method specifications, one for each call to method_kwhandler() or insert_node()

- **std::list< DataModel > dataModelList**
  
  list of model specifications, one for each call to model_kwhandler() or insert_node()

- **std::list< DataVariables > dataVariablesList**
  
  list of variables specifications, one for each call to variables_kwhandler() or insert_node()
• std::list< DataInterface > dataInterfaceList
  list of interface specifications, one for each call to interface_kwhandler() or insert_node()
• std::list< DataResponses > dataResponsesList
  list of responses specifications, one for each call to responses_kwhandler() or insert_node()
• size_t environmentCntr
  counter for environment specifications used in check_input

Private Member Functions

• const Iterator & get_iterator ()
  retrieve an existing Iterator, if it exists in iteratorList, or instantiate a new one
• const Iterator & get_iterator (Model &model)
  retrieve an existing Iterator, if it exists in iteratorList, or instantiate a new one
• const Iterator & get_iterator (const String &method_name, Model &model)
  retrieve an existing Iterator, if it exists in iteratorByNameList, or instantiate a new one
• const Model & get_model ()
  retrieve an existing Model, if it exists, or instantiate a new one
• const Variables & get_variables ()
  retrieve an existing Variables, if it exists, or instantiate a new one
• const Interface & get_interface ()
  retrieve an existing Interface, if it exists, or instantiate a new one
• const Response & get_response (short type, const Variables &vars)
  retrieve an existing Response, if it exists, or instantiate a new one
• ProblemDescDB * get_db (ParallelLibrary &parallel_lib)
  Used by the envelope constructor to instantiate the correct letter class.
• void send_db_buffer ()
  MPI send of a large buffer containing environmentSpec and all objects in dataMethodList, dataModelList, data-VariablesList, dataInterfaceList, and dataResponsesList. Used by manage_inputs().
• void receive_db_buffer ()
  MPI receive of a large buffer containing environmentSpec and all objects in dataMethodList, dataModelList, data-VariablesList, dataInterfaceList, and dataResponsesList. Used by manage_inputs().
• bool model_has_interface (DataModelRep *model_rep) const
  helper function for determining whether an interface specification should be active, based on model type
• void echo_input_file (const ProgramOptions &prog_opts)
  echo the (potentially) specified input file or string to stdout
• void enforce_unique_ids ()
  require user-specified block identifiers to be unique

Private Attributes

• ParallelLibrary & parallelLib
  reference to the parallel_lib object passed from main
• std::list< DataMethod >::iterator dataMethodIter
  iterator identifying the active list node in dataMethodList
• std::list< DataModel >::iterator dataModelIter
  iterator identifying the active list node in dataModelList
• std::list< DataVariables >
  ::iterator dataVariablesIter
  iterator identifying the active list node in dataVariablesList
• std::list< DataInterface >
  ::iterator dataInterfaceIter
  iterator identifying the active list node in dataInterfaceList
• std::list< DataResponses >
  ::iterator dataResponsesIter
  iterator identifying the active list node in dataResponsesList
• IteratorList iteratorList
  list of iterator objects, one for each method specification
• IteratorList iteratorByNameList
  list of iterator objects, one for each lightweight instantiation by name
• ModelList modelList
  list of model objects, one for each model specification
• VariablesList variablesList
  list of variables objects, one for each variables specification
• InterfaceList interfaceList
  list of interface objects, one for each interface specification
• ResponseList responseList
  list of response objects, one for each responses specification
• bool methodDBLocked
  prevents use of get_<type> retrieval and set_<type> update functions prior to setting the list node for the active method specification
• bool modelDBLocked
  prevents use of get_<type> retrieval and set_<type> update functions prior to setting the list node for the active model specification
• bool variablesDBLocked
  prevents use of get_<type> retrieval and set_<type> update functions prior to setting the list node for the active variables specification
• bool interfaceDBLocked
  prevents use of get_<type> retrieval and set_<type> update functions prior to setting the list node for the active interface specification
• bool responsesDBLocked
  prevents use of get_<type> retrieval and set_<type> update functions prior to setting the list node for the active responses specification
• ProblemDescDB * dbRep
  pointer to the letter (initialized only for the envelope)
• int referenceCount
  number of objects sharing dbRep

13.172.1 Detailed Description

The database containing information parsed from the DAKOTA input file.

The ProblemDescDB class is a database for DAKOTA input file data that is populated by a parser defined in a derived class. When the parser reads a complete keyword, it populates a data class object (DataEnvironment, DataMethod, DataVariables, DataInterface, or DataResponses) and, for all cases except environment, appends the object to a linked list (dataMethodList, dataVariablesList, dataInterfaceList, or dataResponsesList). No environment linked list is used since only one environment specification is allowed.
13.172 Constructor & Destructor Documentation

ProblemDescDB ( )
default constructor
   The default constructor: dbRep is NULL in this case. This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.

ProblemDescDB ( ParallelLibrary & parallel_lib )
standard constructor
   This is the envelope constructor which uses problem_db to build a fully populated db object. It only needs to extract enough data to properly execute get_db(problem_db), since the constructor overloaded with BaseConstructor builds the actual base class data inherited by the derived classes.
   References Dakota::abort_handler(), ProblemDescDB::dbRep, and ProblemDescDB::get_db().

ProblemDescDB ( const ProblemDescDB & db )
copy constructor
   Copy constructor manages sharing of dbRep and incrementing of referenceCount.
   References ProblemDescDB::dbRep, and ProblemDescDB::referenceCount.

~ProblemDescDB ( )
destructor
   Destructor decrements referenceCount and only deletes dbRep when referenceCount reaches zero.
   References Dakota::Dak_pddb, ProblemDescDB::dbRep, and ProblemDescDB::referenceCount.

ProblemDescDB ( BaseConstructor, ParallelLibrary & parallel_lib ) [protected]
constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
   This constructor is the one which must build the base class data for all derived classes. get_db() instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization list (to avoid the recursion of the base class constructor calling get_db() again). Since the letter IS the representation, its representation pointer is set to NULL (an uninitialized pointer causes problems in ~ProblemDescDB).

13.172.3 Member Function Documentation

ProblemDescDB operator= ( const ProblemDescDB & db )
assignment operator
   References ProblemDescDB::dbRep, and ProblemDescDB::referenceCount.

void parse_inputs ( ProgramOptions & prog_opts, DbCallbackFunctionPtr callback = NULL, void * callback_data = NULL )
 Parses the input file or input string if present and executes callbacks. Does not perform any validation.
   DB setup phase 1: parse the input file and execute callback functions if present. Rank 0 only.
   DB setup phase 2: optionally insert additional data via late sets. Rank 0 only.
CHAPTER 13. CLASS DOCUMENTATION

References Dakota::abort_handler(), ProblemDescDB::dbRep, ProblemDescDB::derived_parse_inputs(), ProgramOptions::echo_input(), ProblemDescDB::echo_input_file(), ProgramOptions::input_file(), ProgramOptions::input_string(), ProblemDescDB::parallelLib, ProblemDescDB::parse_inputs(), and ParallelLibrary::world_rank().
Referenced by Environment::parse(), and ProblemDescDB::parse_inputs().

void check_and_broadcast ( const ProgramOptions & prog_opts )

performs check_input, broadcast, and post_process, but for now, allowing separate invocation through the public API as well
DB setup phase 3: perform basic checks on keywords counts in current DB state, then sync to all processors.
References ProblemDescDB::broadcast(), ProblemDescDB::check_and_broadcast(), ProblemDescDB::check_input(), ProblemDescDB::dbRep, ProblemDescDB::parallelLib, ProblemDescDB::post_process(), and ParallelLibrary::world_rank().
Referenced by ProblemDescDB::check_and_broadcast(), LibraryEnvironment::done_modifying_db(), and Environment::parse().

void check_input ( )

verifies that there is at least one of each of the required keywords in the dakota input file
NOTE: when using library mode in a parallel application, check_input() should either be called only on world-Rank 0, or it should follow a matched send_db_buffer()/receive_db_buffer() pair.
References Dakota::abort_handler(), ProblemDescDB::check_input(), ParallelLibrary::command_line_post_run_input(), ParallelLibrary::command_line_post_run_output(), ParallelLibrary::command_line_pre_run_input(), ParallelLibrary::command_line_pre_run_output(), ParallelLibrary::command_line_user_modes(), ProblemDescDB::dataInterfaceList, ProblemDescDB::dataMethodList, ProblemDescDB::dataModelList, ProblemDescDB::dataResponsesList, ProblemDescDB::dataVariablesList, ProblemDescDB::dbRep, ProblemDescDB::environmentCntr, ProblemDescDB::parallelLib, and Dakota::strbegins().
Referenced by ProblemDescDB::check_and_broadcast(), and ProblemDescDB::check_input().

void post_process ( )

post-processes the (minimal) input specification to assign default variables/responses specification arrays. Used by manage_inputs().
When using library mode in a parallel application, post_process() should be called on all processors following broadcast() of a minimal problem specification.
References ProblemDescDB::dbRep, and ProblemDescDB::derived_post_process().
Referenced by ProblemDescDB::check_and_broadcast().

ProblemDescDB * get_db ( ParallelLibrary & parallel_lib ) [private]

Used by the envelope constructor to instantiate the correct letter class.
Initializes dbRep to the appropriate derived type. The standard derived class constructors are invoked.
References Dakota::Dak_pddb.
Referenced by ProblemDescDB::ProblemDescDB().

void enforce_unique_ids ( ) [private]

require user-specified block identifiers to be unique
Require string identifiers id_* to be unique across all blocks of each type (method, model, variables, interface, responses
For now, this allows duplicate empty ID strings. Would be better to require unique IDs when more than one block of a given type appears in the input file (instead of use-the-last-parsed)

References Dakota::abort_handler(), ProblemDescDB::dataInterfaceList, ProblemDescDB::dataMethodList, ProblemDescDB::dataModelList, ProblemDescDB::dataResponsesList, and ProblemDescDB::dataVariablesList. Referenced by ProblemDescDB::broadcast().

The documentation for this class was generated from the following files:

- ProblemDescDB.hpp
- ProblemDescDB.cpp

13.173 ProcessApplicInterface Class Reference

Derived application interface class that spawns a simulation code using a separate process and communicates with it through files.

Inheritance diagram for ProcessApplicInterface:

Public Member Functions

- **ProcessApplicInterface** (const ProblemDescDB &problem_db)
  
  *constructor*

- **~ProcessApplicInterface** ()
  
  *destructor*

Protected Member Functions

- void **derived_map** (const Variables &vars, const ActiveSet &set, Response &response, int fn_eval_id)
  
  *Called by map() and other functions to execute the simulation in synchronous mode. The portion of performing an evaluation that is specific to a derived class.*

- void **derived_map_asynch** (const ParamResponsePair &pair)
  
  *Called by map() and other functions to execute the simulation in asynchronous mode. The portion of performing an asynchronous evaluation that is specific to a derived class.*

- const StringArray & **analysis_drivers** () const
  
  *retrieves the analysis drivers specification for application interfaces*

- void **file_cleanup** () const
void remove_params_results_files (const bfs::path &params, const bfs::path &results_path) const

Remove (potentially autotagged for multiple programs) parameters and results files with passed root names.

void autotag_files (const bfs::path &params_path, const bfs::path &results_path, const String &eval_id_tag) const

Utility to automatically tag parameters and results files with passed root names (the files may already need per-program tagging).

virtual void map_bookkeeping (pid_t pid, int fn_eval_id)=0

bookkeeping of process and evaluation ids for asynchronous maps

virtual pid_t create_evaluation_process (bool block_flag)=0

Spawn the evaluation by managing the input filter, analysis drivers, and output filter. Called from derived_map() & derived_map_asynch().

void synchronous_local_analyses (int start, int end, int step)

execute analyses synchronously on the local processor

void define_filenames (const String &eval_id_tag)

define modified filenames from user input by handling Unix temp file and optionally tagging with given eval_id_tag

void write_parameters_files (const Variables &vars, const ActiveSet &set, const Response &response, const int id)

write the parameters data and response request data to one or more parameters files (using one or more invocations of write_parameters_file()) in either standard or aprepro format

void read_results_files (Response &response, const int id, const String &eval_id_tag)

read the response object from one or more results files using full eval_id_tag passed

bfs::path get_workdir_name ()

construct a work directory name (tmp or named), with optional tag

void prepare_process_environment ()

set PATH, environment variables, and change directory prior to fork/system/spawn

void reset_process_environment ()

reset PATH and current directory after system/spawn (workdir case)

Protected Attributes

bool fileTagFlag

flags tagging of parameter/results files

bool fileSaveFlag

flags retention of parameter/results files

bool commandLineArgs

flag indicating use of passing of filenames as command line arguments to the analysis drivers and input/output filters

bool apreproFlag

flag indicating use of the APREPRO (the Sandia “A PRE PROcessor” utility) format for parameter files

unsigned short resultsFileFormat

results file format

bool multipleParamsFiles

flag indicating the need for separate parameters files for multiple analysis drivers

std::string iFilterName
the name of the input filter (input filter user specification)

- std::string oFilterName
  the name of the output filter (output filter user specification)

- std::vector<String> programNames
  the names of the analysis code programs (analysis drivers user specification)

- std::string specifiedParamsFileName
  the name of the parameters file from user specification

- std::string paramsFileName
  the parameters file name actually used (modified with tagging or temp files); only valid from define_filenames to write_parameters_files

- std::string paramsFileWritten
  actual, qualified name of the params file written, possibly with workdir

- std::string specifiedResultsFileName
  the name of the results file from user specification

- std::string resultsFileName
  the results file name actually used (modified with tagging or temp files); only valid from define_filenames to write_parameters_files

- std::string resultsFileWritten
  actual, qualified name of the results file written, possibly with workdir

- std::string fullEvalId
  complete evalIdTag, possibly including hierarchical tagging and final eval id, but not program numbers, for passing to write_parameters_files

- bool allowExistingResults
  by default analysis code interfaces delete results files if they exist; user may override with this flag and we’ll try to gather and only fork if needed

- std::map<int, PathTriple> fileNameMap
  Maps function evaluation ID to triples (parameters, results, and workdir) paths used in spawning function evaluations. Workdir will be empty if not created specifically for this eval.

- bool useWorkdir
  whether to use a work directory

- std::string workDirName
  work directory name, if specified...

- bool dirTag
  whether to tag the working directory

- bool dirSave
  whether dir_save was specified

- bfs::path curWorkdir
  active working directory for this evaluation; valid only from define_filenames to create_evaluation_process

- bfs::path createdDir
  non-empty if created for this eval; valid only from define_filenames to write_parameters_files

- StringArray linkFiles
  template directory (if specified)

- StringArray copyFiles
  template files (if specified)

- bool templateReplace
  whether to replace existing files
CHAPTER 13. CLASS DOCUMENTATION

Private Member Functions

- void write_parameters_file (const Variables &vars, const ActiveSet &set, const Response &response, const std::string &prog, const std::vector<String> &an_comps, const std::string &params_fname)
  
  write the variables, active set vector, derivative variables vector, and analysis components to the specified parameters file in either standard or aprepro format

- void read_results_file (Response &response, const bfs::path &path, const int id)
  
  Open and read the results file at path, properly handling errors.

13.173.1 Detailed Description

Derived application interface class that spawns a simulation code using a separate process and communicates with it through files.

ProcessApplicInterface is subclassed for process handles or file completion testing.

13.173.2 Member Function Documentation

void file_cleanup ( ) const [protected], [virtual]

Remove any files and directories still referenced in the fileNameMap

Reimplemented from Interface.

References WorkdirHelper::concat_path(), ProcessApplicInterface::dirSave, ProcessApplicInterface::fileNameMap, ProcessApplicInterface::fileSaveFlag, ProcessApplicInterface::iFilterName, ProcessApplicInterface::multipleParamsFiles, ProcessApplicInterface::programNames, and WorkdirHelper::recursive_remove().

void autotag_files ( const bfs::path &params_path, const bfs::path &results_path, const String &eval_id_tag ) const [protected]

Utility to automatically tag parameters and results files with passed root names (the files may already need per-program tagging)

Move specified params and results files to unique tagged versions when needed

References WorkdirHelper::concat_path(), ProcessApplicInterface::iFilterName, ProcessApplicInterface::multipleParamsFiles, ProcessApplicInterface::oFilterName, Interface::outputLevel, ProcessApplicInterface::programNames, WorkdirHelper::rename(), ProcessApplicInterface::specifiedParamsFileName, ProcessApplicInterface::specifiedResultsFileName, and ApplicationInterface::suppressOutput.

Referenced by ProcessApplicInterface::read_results_files().

void synchronous_local_analyses ( int start, int end, int step ) [inline], [protected]

execute analyses synchronously on the local processor

Execute analyses synchronously in succession on the local processor (start to end in step increments). Modeled after ApplicationInterface::synchronous_local_evaluations().

References ApplicationInterface::synchronous_local_analysis().

Referenced by ProcessHandleApplicInterface::create_evaluation_process().

void prepare_process_environment ( ) [protected]

set PATH, environment variables, and change directory prior to fork/system/spawn

Guidance: environment (PATH, current directory) should be set immediately before Dakota spawns a process and reset immediately afterwards (except fork which never returns)
References WorkdirHelper::change_directory(), ProcessApplicInterface::curWorkdir, Interface::outputLevel, ProcessApplicInterface::paramsFileName, ProcessApplicInterface::resultsFileName, WorkdirHelper::set_environment(), WorkdirHelper::set_preferred_path(), and ProcessApplicInterface::useWorkdir.

Referenced by SpawnApplicInterface::create_analysis_process(), ForkApplicInterface::create_analysis_process(), SysCallApplicInterface::spawn_analysis_to_shell(), SysCallApplicInterface::spawn_evaluation_to_shell(), SysCallApplicInterface::spawn_input_filter_to_shell(), and SysCallApplicInterface::spawn_output_filter_to_shell().

void reset_process_environment() [protected]
reset PATH and current directory after system/spawn (workdir case)
Undo anything done prior to spawn
References Interface::outputLevel, WorkdirHelper::reset(), WorkdirHelper::startup_pwd(), and ProcessApplicInterface::useWorkdir.
Referenced by SpawnApplicInterface::create_analysis_process(), ForkApplicInterface::create_analysis_process(), SysCallApplicInterface::spawn_analysis_to_shell(), SysCallApplicInterface::spawn_evaluation_to_shell(), SysCallApplicInterface::spawn_input_filter_to_shell(), and SysCallApplicInterface::spawn_output_filter_to_shell().

void read_results_file ( Response & response, const bfs::path & path, const int id ) [private]
Open and read the results file at path, properly handling errors.
Helper for read_results_files that opens the results file at results_path and reads it, handling various errors/exceptions.
References Dakota::abort_handler(), Response::read(), and ProcessApplicInterface::resultsFileFormat.
Referenced by ProcessApplicInterface::read_results_files().
The documentation for this class was generated from the following files:

• ProcessApplicInterface.hpp
• ProcessApplicInterface.cpp

13.174  ProcessHandleApplicInterface Class Reference

Derived application interface class that spawns a simulation code using a separate process, receives a process identifier, and communicates with the spawned process through files.

  *set argList for execution of the input filter*

- void **ofilter_argument_list** ()
set argList for execution of the output filter

- void driver_argument_list (int analysis_id)
  set argList for execution of the specified analysis driver
- void create_command_arguments (boost::shared_array< const char *> &av, StringArray &driver_and_args)
  parse argList into argument array av suitable for passing to execvp, appending parameters and results filenames if requested by commandLineArgs

Protected Attributes

- std::map<pid_t, int> evalProcessIdMap
  map of fork process id’s to function evaluation id’s for asynchronous evaluations
- std::map<pid_t, int> analysisProcessIdMap
  map of fork process id’s to analysis job id’s for asynchronous analyses
- std::vector<std::string> argList
  an array of strings for use with execvp(const char *, char * const *). These are converted to an array of const char *’s in fork program().

13.174.1 Detailed Description

Derived application interface class that spawns a simulation code using a separate process, receives a process identifier, and communicates with the spawned process through files.

ProcessHandleApplicInterface is subclassed for fork/execvp/waitpid (Unix) and spawnvp (Windows).

13.174.2 Constructor & Destructor Documentation

ProcessHandleApplicInterface ( const ProblemDescDB & problem_db ) [inline]
constructor
  argList sized 3 for [driver name, input file, output file]

13.174.3 Member Function Documentation

int synchronous_local_analysis ( int analysis_id ) [inline], [protected], [virtual]
This code provides the derived function used by ApplicationInterface:: serve_analyses_synch() as well as a convenience function for ProcessHandleApplicInterface::synchronous_local_analyses() below.
  Reimplemented from ApplicationInterface.
  References ProcessHandleApplicInterface::create_analysis_process(), and ProcessHandleApplicInterface::driver_argument_list().

void init_communicators_checks ( int max_eval_concurrency ) [inline], [protected], [virtual]
No derived interface plug-ins, so perform construct-time checks. However, process init issues as warnings since some contexts (e.g., HierarchSurrModel) initialize more configurations than will be used.
  Reimplemented from ApplicationInterface.
  References ApplicationInterface::check_multiprocessor_analysis(), and ApplicationInterface::check_multiprocessor_async().
void set_communicators_checks ( int max_eval_concurrency ) [inline], [protected], [virtual]

Process run-time issues as hard errors.
Reimplemented from ApplicationInterface.
References Dakota::abort_handler(), ApplicationInterface::check_multiprocessor_analysis(), and ApplicationInterface::check_multiprocessor_asynchronous().

pid_t create_evaluation_process ( bool block_flag ) [protected], [virtual]

Manage the input filter, 1 or more analysis programs, and the output filter in blocking or nonblocking mode as governed by block_flag. In the case of a single analysis and no filters, a single fork is performed, while in other cases, an initial fork is reforked multiple times. Called from derived_map() with block_flag == BLOCK and from derived_map_asynch() with block_flag == FALL, THROUGH. Uses create_analysis_process() to spawn individual program components within the function evaluation.
Implements ProcessApplicInterface.
References Dakota::abort_handler(), ProcessHandleApplicInterface::analysis_process_group_id(), ApplicationInterface::analysisServerId, ApplicationInterface::asynchLocalAnalysisConcurrency, ApplicationInterface::asynchLocalAnalysisFlag, ProcessHandleApplicInterface::asynchronous_local_analyses(), ParallelLibrary::barrier_e(), ProcessApplicInterface::commandLineArgs, ProcessHandleApplicInterface::create_analysis_process(), ProcessHandleApplicInterface::driver_argument_list(), ApplicationInterface::eaDedMasterFlag, ApplicationInterface::evalCommRank, ApplicationInterface::evalCommSize, ProcessHandleApplicInterface::evalProcessIdMap, ProcessHandleApplicInterface::evaluation_process_group_id(), ProcessHandleApplicInterface::filter_argument_list(), ProcessApplicInterface::filterName, ProcessHandleApplicInterface::join_evaluation_process_group(), ApplicationInterface::master_dynamic_schedule_analyses(), ProcessApplicInterface::multipleParamsFiles, ApplicationInterface::numAnalysisDrivers, ApplicationInterface::numAnalysisServers, ProcessHandleApplicInterface::ofilter_argument_list(), ProcessApplicInterface::oFilterName, ApplicationInterface::parallelLib, ProcessApplicInterface::paramsFileName, ProcessApplicInterface::programNames, ProcessApplicInterface::resultsFileName, ProcessHandleApplicInterface::serve_analyses_asynch(), ApplicationInterface::serve_analyses_synch(), Dakota::substitute_params_and_results(), ApplicationInterface::suppressOutput, and ProcessApplicInterface::synchronous_local_analyses().

void check_wait ( pid_t pid, int status ) [protected]

check the exit status of a forked process and abort if an error code was returned.
Check to see if the process terminated abnormally (WIFEXITED(status)==0) or if either execvp or the application returned a status code of -1 (WIFEXITED(status)!=0 && (signed char)WEXITSTATUS(status)==-1).
If one of these conditions is detected, output a failure message and abort. Note: the application code should not return a status code of -1 unless an immediate abort of dakota is wanted. If for instance, failure capturing is to be used, the application code should write the word "FAIL" to the appropriate results file and return a status code of 0 through exit().
References Dakota::abort_handler().
Referenced by ForkApplicInterface::create_analysis_process(), SpawnApplicInterface::test_local_analyses_send(), SpawnApplicInterface::test_local_evaluations(), ForkApplicInterface::wait(), SpawnApplicInterface::wait_local_analyses(), and SpawnApplicInterface::wait_local_evaluations().

void asynchronous_local_analyses ( int start, int end, int step ) [protected]

execute analyses asynchronously on the local processor.
Schedule analyses asynchronously on the local processor using a dynamic scheduling approach (start to end in step increments). Concurrency is limited by asynchLocalAnalysisConcurrency. Modeled after ApplicationInterface::asynchronous_local_evaluations(). NOTE: This function should be elevated to ApplicationInterface if and when another derived interface class supports asynchronous local analyses.
References Dakota::abort_handler(), ProcessHandleApplicInterface::analysisProcessIdMap, ApplicationInterface::asynchLocalAnalysisConcurrency, ProcessHandleApplicInterface::create_analysis_process(), ProcessHandleApplicInterface::driver_argument_list(), ApplicationInterface::numAnalysisDrivers, and ProcessHandleApplicInterface::wait_local_analyses().

Referenced by ProcessHandleApplicInterface::create_evaluation_process().

```cpp
void serve_analyses_asynch ( ) [protected]
```

serve the analysis scheduler and execute analysis jobs asynchronously

This code runs multiple asynchronous analyses on each server. It is modeled after ApplicationInterface::serve_evaluations_asynch(). NOTE: This fn should be elevated to ApplicationInterface if and when another derived interface class supports hybrid analysis parallelism.

References Dakota::abort_handler(), ProcessHandleApplicInterface::analysisProcessIdMap, ApplicationInterface::asynchLocalAnalysisConcurrency, ProcessHandleApplicInterface::create_analysis_process(), ProcessHandleApplicInterface::driver_argument_list(), ParallelLibrary::irecv_ea(), ApplicationInterface::numAnalysisDrivers, ApplicationInterface::parallelLib, ParallelLibrary::recv_ea(), ParallelLibrary::test(), and ProcessHandleApplicInterface::test_local_analyses_send().

Referenced by ProcessHandleApplicInterface::create_evaluation_process().

```cpp
void create_command_arguments ( boost::shared_array< const char * > & av, StringArray & driver_and_args ) [protected]
```

parse argList into argument array av suitable for passing to execvp, appending parameters and results filenames if requested by commandLineArgs

This function will split the analysis command in argList[0] based on whitespace, but preserve spaces within quoted strings, such that quoted strings can be passed as single command arguments. NOTE: This function allocates memory in av that might be implicitly freed when the child exits (control never returns to caller). driver_and_args needs to be a return argument because av will contain pointers into its c_str()’s when done.

References ProcessHandleApplicInterface::argList, ProcessApplicInterface::commandLineArgs, Dakota::substitute_params_and_results(), and WorkdirHelper::tokenize_driver().

Referenced by SpawnApplicInterface::create_analysis_process(), and ForkApplicInterface::create_analysis_process().

The documentation for this class was generated from the following files:

- ProcessHandleApplicInterface.hpp
- ProcessHandleApplicInterface.cpp

### 13.175 ProgramOptions Class Reference

ProgramOptions stores options whether from the CLH or from library user; initially valid only on worldRank = 0, but then broadcast in ParallelLibrary::push_output_tag()

**Public Member Functions**

- **ProgramOptions ()**
  
  `default constructor (needed for default environment ctors and could be used by library clients to late update data)`

- **ProgramOptions (int world_rank)**
  
  `constructor that accepts world rank to help with I/O control; allows default constructed ProgramOptions to get rank in library mode`
• **ProgramOptions** (int argc, char∗ argv[], int world_rank)
  standard constructor that uses a CommandLineHandler to parse user options
• const String & input_file () const
  *Dakota* input file base name (no tag)
• const String & input_string () const
  alternate *Dakota* input string literal; also set when input is read from stdin
• bool echo_input () const
  is input echo specified?
• const String & parser_options () const
  *(deprecated)* NIDR parser options
• String output_file () const
  output (user-provided or default) file base name (no tag)
• const String & error_file () const
  error file base name (no tag)
• const String & exit_mode () const
  behavior of abort_handler (throw or exit)
• const String & read_restart_file () const
  restart file base name (no tag)
• size_t stop_restart_evals () const
  eval ID at which to stop reading restart
• String write_restart_file () const
  write restart (user-provided or default) file base name (no tag)
• bool help () const
  is help mode active?
• bool version () const
  is version mode active?
• bool check () const
  is check mode active?
• bool pre_run () const
  is pre-run mode active?
• bool run () const
  is run mode active?
• bool post_run () const
  is post-run mode active?
• bool user_modes () const
  are any non-default, user-specified run modes active?
• const String & pre_run_input () const
  filename for pre-run input
• const String & pre_run_output () const
  filename for pre-run output
• const String & run_input () const
  filename for run input
• const String & run_output () const
filename for run output
• const String & post_run_input () const
  filename for post-run input
• const String & post_run_output () const
  filename for post-run output
• unsigned int pre_run_output_format () const
  tabular format for pre-run output
• unsigned int post_run_input_format () const
  tabular format for post-run input
• bool proceed_to_instantiate () const
  whether steps beyond help/version are requested (instantiation required)
• bool proceed_to_run () const
  Whether steps beyond check are requested.
• bool user_stdout_redirect () const
  whether the user/client code requested a redirect of stdout
• bool user_stderr_redirect () const
  whether the user/client code requested a redirect of stderr
• void world_rank (int world_rank)
  set the world rank to govern early conditional output
• void input_file (const String &in_file)
  set Dakota input file base name (no tag)
• void input_string (const String &in_string)
  set alternate Dakota input string literal
• void echo_input (bool echo_flag)
  set whether to echo input to output
• void exit_mode (const String &mode)
  set behavior for abort handler
• void output_file (const String &out_file)
  set base file name for Dakota output
• void error_file (const String &err_file)
  set base file name for Dakota errors
• void read_restart_file (const String &read_rst)
  set base file name for restart file from which to read
• void stop_restart_evals (size_t stop_rst)
  set eval ID at which to stop reading restart
• void write_restart_file (const String &write_rst)
  set base file name for restart file to write
• void help (bool help_flag)
  set true to print help information and exit
• void version (bool version_flag)
  set true to print version information and exit
• void check (bool check_flag)
  set true to check input and instantiate objects, then exit
• void `pre_run` (bool `pre_run_flag`)
  
  set to enable/disable pre-run phase

• void `run` (bool `run_flag`)

  set to enable/disable run phase

• void `post_run` (bool `post_run_flag`)

  set to enable/disable post-run phase

• void `pre_run_input` (const String &`pre_run_in`)

  Specify the pre-run phase input filename.

• void `pre_run_output` (const String &`pre_run_out`)

  Specify the pre-run phase output filename.

• void `run_input` (const String &`run_in`)

  Specify the run phase input filename.

• void `run_output` (const String &`run_out`)

  Specify the run phase output filename.

• void `post_run_input` (const String &`post_run_in`)

  Specify the post-run phase input filename.

• void `post_run_output` (const String &`post_run_out`)

  Specify the post-run phase output filename.

• void `parse` (const `ProblemDescDB` &`problem_db`)

  Extract environment options from `ProblemDescDB`.

• void `read` (MPIUnpackBuffer &s)

  helper function for reading some class data from MPI buffer

• void `write` (MPIPackBuffer &s) const

  helper function for writing some class data to MPI buffer

**Private Member Functions**

• void `parse_environment_options` ()

  any environment variables affecting global behavior get read here

• void `manage_run_modes` (const `CommandLineHandler` &clh)

  retrieve run mode options from the CLH

• void `split_filenames` (const char *`filenames`, std::string &`input_filename`, std::string &`output_filename`)

  manage pre/run/post filenames

• void `validate` ()

  verify consistency of user settings (helpful for library mode especially)

• void `validate_run_modes` ()

  validate user run modes and set userModesFlag

• void `set_option` (const `ProblemDescDB` &`problem_db`, const String &`db_name`, String &`data_member`)

  retrieve environment. `<db_name>` from the problem db and update data_member, warning if needed
Private Attributes

- `int worldRank`
  cache the world rank to help with conditional output

- `String inputFile`
  Dakota input file name, e.g., "dakota.in".

- `String inputString`
  alternate input means for library clients: input string (mutually exclusive with input file)

- `bool echoInput`
  whether to echo client’s input file at parse

- `String parserOptions`
  Deprecated option for NIDR parser options.

- `String exitMode`
  Abort or throw on error.

- `String outputFile`
  Dakota output base file name, e.g., "dakota.out".

- `String errorFile`
  Dakota error base file name, e.g., "dakota.err".

- `String readRestartFile`
  e.g., "dakota.old.rst"

- `size_t stopRestartEvals`
  eval number at which to stop restart read

- `String writeRestartFile`
  e.g., "dakota.new.rst"

- `bool helpFlag`
  whether to print help message and exit

- `bool versionFlag`
  whether to print version message and exit

- `bool checkFlag`
  flags invocation with command line option -check

- `bool preRunFlag`
  flags invocation with command line option -pre_run

- `bool runFlag`
  flags invocation with command line option -run

- `bool postRunFlag`
  flags invocation with command line option -post_run

- `bool userModesFlag`
  whether any user run modes are active

- `String preRunInput`
  filename for pre_run input

- `String preRunOutput`
  filename for pre_run output

- `String runInput`
CHAPTER 13. CLASS DOCUMENTATION

13.175.1 Detailed Description

ProgramOptions stores options whether from the CLH or from library user; initially valid only on worldRank = 0, but then broadcast in ParallelLibrary::push_output_tag()

13.175.2 Member Function Documentation

void split_filenames( const char *filenames, std::string &input_filename, std::string &output_filename ) [private]

manage pre/run/post filenames
Tokenize colon-delimited input and output filenames, returns unchanged strings if tokens not found.
Referenced by ProgramOptions::manage_run_modes().
The documentation for this class was generated from the following files:
• ProgramOptions.hpp
• ProgramOptions.cpp

13.176 PStudyDACE Class Reference

Base class for managing common aspects of parameter studies and design of experiments methods.
Inheritance diagram for PStudyDACE:

Public Member Functions

• bool resize ()
reinitializes iterator based on new variable size
Protected Member Functions

- **PStudyDACE (ProblemDescDB &problem_db, Model &model)**
  *constructor*
- **PStudyDACE (unsigned short method_name, Model &model)**
  *alternate constructor for instantiations “on the fly”*
- **~PStudyDACE ()**
  *destructor*
- **void print_results (std::ostream &s, short results_state=FINAL_RESULTS)**
  *print the final iterator results*
- **void volumetric_quality (int ndim, int num_samples, double *sample_points)**
  *Calculation of volumetric quality measures.*

Protected Attributes

- **SensAnalysisGlobal pStudyDACEsensGlobal**
  *initialize statistical post processing*
- **bool volQualityFlag**
  *flag which specifies evaluation of volumetric quality measures*
- **bool varBasedDecompFlag**
  *flag which specifies calculating variance based decomposition sensitivity analysis metrics*

Private Attributes

- **double chiMeas**
  *quality measure*
- **double dMeas**
  *quality measure*
- **double hMeas**
  *quality measure*
- **double tauMeas**
  *quality measure*

Additional Inherited Members

13.176.1 Detailed Description

Base class for managing common aspects of parameter studies and design of experiments methods.

The PStudyDACE base class manages common data and functions, such as those involving the best solutions located during the parameter set evaluations or the printing of final results.
13.176.2 Member Function Documentation

void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Analyzer.

References PStudyDACE::chiMeas, Analyzer::compactMode, Model::continuous_variable_labels(), SensAnalysisGlobal::correlations_computed(), Model::discrete_int_variable_labels(), Model::discrete_real_variable_labels(), Model::discrete_string_variable_labels(), PStudyDACE::dMeas, PStudyDACE::hMeas, Iterator::iteratedModel, Analyzer::numLSqTerms, Analyzer::numObjFns, SensAnalysisGlobal::print_correlations(), Analyzer::print_results(), Analyzer::print_sobol_indices(), PStudyDACE::pStudyDACEGlobal, Model::response_labels(), PStudyDACE::tauMeas, PStudyDACE::varBasedDecompFlag, and PStudyDACE::volQualityFlag.

void volumetric_quality ( int ndim, int num_samples, double * sample_points ) [protected]

Calculation of volumetric quality measures.

Calculation of volumetric quality measures developed by FSU.

References PStudyDACE::chiMeas, PStudyDACE::dMeas, PStudyDACE::hMeas, and PStudyDACE::tauMeas.

Referenced by FSUDesignCompExp::get_parameter_sets(), and DDACEDesignCompExp::get_parameter_sets().

The documentation for this class was generated from the following files:

- DakotaPStudyDACE.hpp
- DakotaPStudyDACE.cpp

13.177 PSUADEDesignCompExp Class Reference

Wrapper class for the PSUADE library.

Inheritance diagram for PSUADEDesignCompExp:

```
Iterator

Analyzer

PStudyDACE

PSUADEDesignCompExp
```

Public Member Functions

- PSUADEDesignCompExp (ProblemDescDB &problem_db, Model &model)
  primary constructor for building a standard DACE iterator
- ~PSUADEDesignCompExp ()
Protected Member Functions

- void pre_run ()
  pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori
- void post_input ()
  read tabular data for post-run mode
- void core_run ()
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
- void post_run (std::ostream &s)
  post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way
- int num_samples () const
- void sampling_reset (int min_samples, bool all_data_flag, bool stats_flag)
  reset sampling iterator to use at least min_samples
- unsigned short sampling_scheme () const
  return sampling name
- void vary_pattern (bool pattern_flag)
  sets varyPattern in derived classes that support it
- void get_parameter_sets (Model &model)
  Generate one block of numSamples samples (ndim * num_samples), populating allSamples: ParamStudy is the only class that specializes to use allVariables.

Private Member Functions

- void enforce_input_rules ()
  enforce sanity checks/modifications for the user input specification

Private Attributes

- int samplesSpec
  initial specification of number of samples
- int numSamples
  current number of samples to be evaluated
- const UShortArray & varPartitionsSpec
  number of partitions in each variable direction
- int numPartitions
  number of partitions to pass to PSUADE (levels = partitions + 1)
- bool allDataFlag
  flag which triggers the update of allVars/allResponses for use by Iterator::all_variables() and Iterator::all_responses()
counter for number of executions for this object

- bool varyPattern
  flag for generating a sequence of seed values within multiple get_parameter_sets() calls so that the sample sets are not repeated, but are still repeatable

- const int seedSpec
  the user seed specification for the random number generator (allows repeatable results)

- int randomSeed
  current seed for the random number generator

Additional Inherited Members

13.177.1 Detailed Description

Wrapper class for the PSUADE library.

The PSUADEDesignCompExp class provides a wrapper for PSUADE, a C++ design of experiments library from Lawrence Livermore National Laboratory. Currently this class only includes the PSUADE Morris One-at-a-time (MOAT) method to uniformly sample the parameter space spanned by the active bounds of the current Model. It returns all generated samples and their corresponding responses as well as the best sample found.

13.177.2 Constructor & Destructor Documentation

PSUADEDesignCompExp ( ProblemDescDB & problem db, Model & model )

primary constructor for building a standard DACE iterator

This constructor is called for a standard iterator built with data from probDescDB.

References Dakota::abort_handler(), Iterator::maxEvalConcurrency, Iterator::method_string(), Iterator::method-Name, Analyzer::numDiscreteIntVars, Analyzer::numDiscreteRealVars, Analyzer::numDiscreteStringVars, and PSUADEDesignCompExp::numSamples.

13.177.3 Member Function Documentation

void pre_run ( ) [protected], [virtual]

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori

pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely integrated into the derived run function. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s pre_run(), if implemented, typically before performing its own implementation steps.

Reimplemented from Analyzer.

References PSUADEDesignCompExp::enforce_input_rules(), PSUADEDesignCompExp::get_parameter_sets(), Iterator::iteratedModel, and Analyzer::pre_run().

void core_run ( ) [protected], [virtual]

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post

Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.

Reimplemented from Iterator.

References Analyzer::evaluate_parameter_sets(), Iterator::iteratedModel, Analyzer::numLSqTerms, and Analyzer-::numObjFns.
void post_run ( std::ostream & s ) [protected], [virtual]

post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/Responses and perform final analysis phase in a standalone way

Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent's post_run(), typically after performing its own implementation steps.

Reimplemented from Analyzer.

References Dakota::abort_handler(), Analyzer::allResponses, Analyzer::allSamples, Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), PSUADEDesignCompExp::enforce_input_rules(), Iterator::iterated_Model, Analyzer::numContinuousVars, Analyzer::numFunctions, PSUADEDesignCompExp::numSamples, and Analyzer::post_run().

int num_samples ( ) const [inline], [protected], [virtual]

Return current number of evaluation points. Since the calculation of samples, collocation points, etc. might be costly, provide a default implementation here that backs out from the maxEvalConcurrency.

Reimplemented from Analyzer.

References PSUADEDesignCompExp::numSamples.

void enforce_input_rules ( ) [private]

enforce sanity checks/modifications for the user input specification

Users may input a variety of quantities, but this function must enforce any restrictions imposed by the sampling algorithms.

References Analyzer::numContinuousVars, PSUADEDesignCompExp::numPartitions, PSUADEDesignCompExp::numSamples, and PSUADEDesignCompExp::varPartitionsSpec.

Referenced by PSUADEDesignCompExp::post_input(), PSUADEDesignCompExp::post_run(), and PSUADEDesignCompExp::pre_run().

The documentation for this class was generated from the following files:

- PSUADEDesignCompExp.hpp
- PSUADEDesignCompExp.cpp

13.178 PythonInterface Class Reference

Inheritance diagram for PythonInterface:

```
Interface
  ApplicationInterface
    DirectApplicInterface
      PythonInterface
```
CHAPTER 13. CLASS DOCUMENTATION

Public Member Functions

- **PythonInterface** (const ProblemDescDB &problem_db)
  - constructor
- **~PythonInterface** ()
  - destructor

Protected Member Functions

- virtual int **derived_map_ac** (const String &ac_name)
  - execute an analysis code portion of a direct evaluation invocation
- int **python_run** (const String &ac_name)
  - direct interface to Python via API, BMA 07/02/07
- template<class ArrayT, class Size>
  - bool **python_convert_int** (const ArrayT &src, Size size, PyObject **dst)
    - convert arrays of integer types to Python list or numpy array
- bool **python_convert** (const RealVector &src, PyObject **dst)
  - convert RealVector to Python list or numpy array
- bool **python_convert** (const RealVector &c_src, const IntVector &di_src, const RealVector &dr_src, PyObject **dst)
  - convert RealVector + IntVector + RealVector to Python mixed list or numpy double array
- template<class StringArrayT>
  - bool **python_convert_strlist** (const StringArrayT &src, PyObject **dst)
  - convert labels
- bool **python_convert** (const StringMultiArray &c_src, const StringMultiArray &di_src, const StringMultiArray &dr_src, PyObject **dst)
  - convert all labels to single list
- bool **python_convert** (PyObject *pyv, RealVector &rv, const int &dim)
  - convert python [list of int or float] or [numpy array of double] to RealVector (for fn)
- bool **python_convert** (PyObject *pyv, double *rv, const int &dim)
  - convert python [list of int or float] or [numpy array of double] to double[], for use as helper in converting gradients
- bool **python_convert** (PyObject *pym, RealMatrix &rm)
  - convert python [list of lists of int or float] or [numpy array of dbl] to RealMatrix (for gradients)
- bool **python_convert** (PyObject *pym, RealSymMatrix &rm)
  - convert python [list of lists of int or float] or [numpy array of dbl] to RealMatrix (used as helper in Hessian conversion)
- bool **python_convert** (PyObject *pyma, RealSymMatrixArray &rma)
  - convert python [list of lists of lists of int or float] or [numpy array of double] to RealSymMatrixArray (for Hessians)

Protected Attributes

- bool userNumpyFlag
  - whether the user requested numpy data structures in the input file
- bool ownPython
  - true if this class created the interpreter instance
13.178.1 Detailed Description

Specialization of DirectApplicInterface to link to Python analysis drivers. Includes convenience functions to map data to/from Python.

13.178.2 Member Function Documentation

**int derived\_map\_ac ( const String & ac\_name ) [protected], [virtual]**

execute an analysis code portion of a direct evaluation invocation

- Python specialization of derived analysis components.
- Reimplemented from DirectApplicInterface.
- References ApplicationInterface::analysisServerId, and PythonInterface::python\_run().

**bool python\_convert\_int ( const ArrayT & src, Size sz, PyObject ** dst ) [protected]**

convert arrays of integer types to Python list or numpy array

- convert all integer array types including IntVector, ShortArray, and SizetArray to Python list of ints or numpy array of ints
- References PythonInterface::userNumpyFlag.
- Referenced by PythonInterface::python\_run().
- The documentation for this class was generated from the following files:
  - PythonInterface.hpp
  - PythonInterface.cpp

### 13.179 QMEApproximation Class Reference

Derived approximation class for QMEA Quadratic Multipoint Exponential Approximation (a multipoint approximation).

Inheritance diagram for QMEApproximation:

```
Approximation

QMEApproximation
```

#### Public Member Functions

- **QMEApproximation ()**  
  *default constructor*

- **QMEApproximation (ProblemDescDB &problem\_db, const SharedApproxData &shared\_data, const String &approx\_label)**  
  *standard constructor*

- **QMEApproximation (const SharedApproxData &shared\_data)**  
  *alternate constructor*

- **~QMEApproximation ()**  
  *destructor*
CHAPTER 13. CLASS DOCUMENTATION

Protected Member Functions

- int min_coefficients() const
  return the minimum number of samples (unknowns) required to build the derived class approximation type in num- Vars dimensions
- void build()
  builds the approximation from scratch
- Real value(const Variables &vars)
  retrieve the approximate function value for a given parameter vector
- const RealVector & gradient(const Variables &vars)
  retrieve the approximate function gradient for a given parameter vector
- void clear_current_active_data()

Private Member Functions

- void find_scaled_coefficients()
  compute TANA coefficients based on scaled inputs
- void offset(const RealVector &x, RealVector &s)
  based on minX, apply offset scaling to x to define s

Private Attributes

- RealVector pExp
  vector of exponent values
- RealVector minX
  vector of minimum parameter values used in scaling
- RealVector scX1
  vector of scaled x1 values
- RealVector scX2
  vector of scaled x2 values
- Real H
  the scalar Hessian value in the TANA-3 approximation

Additional Inherited Members

13.179.1 Detailed Description

Derived approximation class for QMEA Quadratic Multipoint Exponential Approximation (a multipoint approximation).

The QMEAApproximation class provides a multipoint approximation based on matching value and gradient data from multiple points (typically the current and previous iterates) in parameter space. It forms an exponential approximation in terms of intervening variables.
13.179.2 Member Function Documentation

```cpp
void build() [protected], [virtual]
```
builds the approximation from scratch
This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations
should explicitly invoke (or reimplement) this base class contribution.
Reimplemented from Approximation.
References Dakota::abort_handler(), Approximation::build(), QMEApproximation::find_scaled_coefficients(),
Dakota::length(), QMEApproximation::minX, SharedApproxData::numVars, QMEApproximation::pExp,
Approximation::sharedDataRep, and Approximation::surrogate_data().

```cpp
void clear_current_active_data() [inline], [protected], [virtual]
```
Redefine default implementation to support history mechanism.
Reimplemented from Approximation.
References Approximation::approxData, SharedApproxData::approxDataKeys, SharedApproxData::numVars,
and Approximation::sharedDataRep.

13.180 QuesoJointPdf< V, M > Class Template Reference

**Dakota** specialization of QUESO generic joint PDF.
Inherits BaseJointPdf< V, M >.

**Public Member Functions**

- QuesoJointPdf (const char *prefix, const QUESO::VectorSet< V, M > &domainSet, NonDQUESOBayesCalibration *nond_queso_ptr)
  Default constructor.
- virtual ~QuesoJointPdf ()
  Destructor.
- double actualValue (const V &domainVector, const V *domainDirection, V *gradVector, M *hessianMatrix, V *hessianEffect) const
  Actual value of the PDF (scalar function).
- double lnValue (const V &domainVector, const V *domainDirection, V *gradVector, M *hessianMatrix, V *hessianEffect) const
  Logarithm of the value of the function.
- double computeLogOfNormalizationFactor (unsigned int numSamples, bool m_logOfNormalizationFactor) const
  Computes the logarithm of the normalization factor.
- void distributionMean (V &meanVector) const
  Mean value of underlying random variable.
- void distributionVariance (M &covMatrix) const
  Covariance of the underlying random variable.
Private Attributes

- \textbf{NonDQUESOBayesCalibration} \ast \textbf{nonDQUESOInstance}
  
  pointer to QUESO instance for PDF evaluation callbacks

13.180.1 Detailed Description

\textbf{template} <\textbf{class V}, \textbf{class M}> \textbf{class Dakota::QuesoJointPdf} <\textbf{V}, \textbf{M}>

\textbf{Dakota} specialization of QUESO generic joint PDF.

13.180.2 Constructor \& Destructor Documentation

\textbf{QuesoJointPdf ( const char \ast prefix, const QUESO::VectorSet< V, M > \& domainSet, NonDQUESOBayesCalibration \ast \textbf{nond_queso_ptr} )}

Default constructor.

  Instantiates an object of the class, i.e. a scalar function, given a prefix and its domain.

13.180.3 Member Function Documentation

\textbf{void distributionMean ( V \& meanVector ) const}

Mean value of underlying random variable.

  Assumes meanVector is sized

\textbf{void distributionVariance ( M \& covMatrix ) const}

Covariance of the underlying random variable.

  Assumes covMatrix is sized

The documentation for this class was generated from the following files:

- QUESOImpl.hpp
- QUESOImpl.cpp

13.181 \textbf{QuesoVectorRV < V, M > Class Template Reference}

\textbf{Dakota} specialization of QUESO vector-valued random variable.

  Inherits BaseVectorRV < V, M >.

Public Member Functions

- \textbf{QuesoVectorRV ( const char \ast prefix, const QUESO::VectorSet< V, M > \&imageSet, NonDQUESOBayesCalibration \ast nond_queso_ptr) }
  
  Default constructor.

- virtual \textbf{\sim QuesoVectorRV ()}

  Virtual destructor.

- void \textbf{print ( std::ostream \&os ) const}

  \textit{TODO: Prints the vector RV (required pure virtual).}
13.181.1 Detailed Description

template< class V, class M > class Dakota::QuesoVectorRV< V, M >

Dakota specialization of QUESO vector-valued random variable.

13.181.2 Constructor & Destructor Documentation

QuesoVectorRV ( const char * prefix, const QUESO::VectorSet< V, M > & imageSet, NonDQUESOBayesCalibration * nond_queso_ptr )

Default constructor.
Constructs a generic queso vector RV, given a prefix and the image set of the vector RV. The documentation for this class was generated from the following files:

- QUESOImpl.hpp
- QUESOImpl.cpp

13.182 RandomFieldModel Class Reference

Random field model, capable of generating and then forward propagating.

Inheritance diagram for RandomFieldModel:

```
Model
  RecastModel
  RandomFieldModel
```

Public Member Functions

- RandomFieldModel (ProblemDescDB &problem_db)
  Problem database constructor.
- ~RandomFieldModel ()
 Destructor
- bool initialize_mapping (ParLevLIter pl_iter)
  for KL models, the model is augmented with the random coeffs of the KL
- bool finalize_mapping ()
  finalize model mapping, returns true if the variables size has changed
- bool mapping_initialized () const
  return true if mapping has been fully initialized, false otherwise.
- bool resize_pending () const
  return true if a potential resize is still pending, such that sizing-based initialization should be deferred
Protected Member Functions

- **Model get_sub_model (ProblemDescDB &problem_db)**  
  retrieve the sub-Model from the DB to pass up the constructor chain
- **void init_dace_iterator (ProblemDescDB &problem_db)**  
  initialize the RF-generating sampler
- **void validate_inputs ()**  
  validate the build controls and set defaults
- **void get_field_data ()**  
  Source data generation: get the field data either from file or simulation by running the DACE Iterator. Populates rfBuildData.
- **void identify_field_model ()**  
  Generate field representation: generate a KL or PCA/GP.
- **void rf_suite_identify_field_model ()**  
  Generate field representation: utilize RF Suite.
- **void initialize_recast ()**  
  Initialize the base class RecastModel with reduced space variable sizes.
- **SizetArray variables_resize ()**  
  Create a variables components totals array with the reduced space size for continuous variables.
- **void initialize_rf_coeffs ()**  
  For KL models, augment the subModel’s uncertain variables with additional N(0,1) variables; set up AleatoryDist-Params for the N(0,1)’s.
- **void derived_evaluate (const ActiveSet &set)**  
  generate a random field realization, then evaluate the submodel
- **void derived_evaluate_nowait (const ActiveSet &set)**  
  generate a random field realization, then evaluate the submodel (asynch)
- **void generate_kl_realization ()**  
  generate a KL realization and write to file
- **void generate_pca_gp_realization ()**  
  generate a PCA/GP realization and write to file
- **void write_field (const RealVector &field,prediction)**  
  write a field realization to console and file

Static Protected Member Functions

- **static void vars_mapping (const Variables &recast_xi_vars, Variables &sub_model_x_vars)**  
  map the active continuous recast variables to the active submodel variables (linear transformation)
- **static void set_mapping (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)**  
  map the inbound ActiveSet to the sub-model (map derivative variables)
Protected Attributes

- String rfDataFilename
  name of the data file with RF build data
- size_t numObservations
  rows of data matrix
- IntVector fieldLengths
  column partitions of data matrix
- RealMatrix rfBuildData
  data matrix with realizations of the random field to approximate
- RealMatrix rfBuildVars
  matrix of samples used to build the RF data
- Iterator daceIterator
  String dataDirectoryBasename;
- unsigned short expansionForm
- unsigned short analyticCovForm;
- unsigned short covarianceForm
  form of the analytic covariance function
- int requestedReducedRank
  current approximation of system rank
- Real percentVariance
  fraction of energy to capture
- int actualReducedRank
  command to run RF Suite
- ReducedBasis rfBasis
  reduced basis representation (for KL or PCA case)
- int fieldRealizationId
  counter for RF Suite
- std::vector< Approximation > gpApproximations
  approximate models used to map the uncertain vars through the PCA approx
- bool mappingInitialized
  the index of the active metaiterator-iterator parallelism level (corresponding to ParallelConfiguration::miPLIters)
  used at runtime

Static Protected Attributes

- static RandomFieldModel * rfmInstance
  static pointer to this class for use in static callbacks

Additional Inherited Members

13.182.1 Detailed Description

Random field model, capable of generating and then forward propagating.

Specialization of a RecastModel that optionally identifies an approximate random field model during build phase and creates a RecastModel capable of performing forward UQ including the field and auxiliiary uncertain variables reduced space. This RandomFieldModel wraps the random field propagation model (not the RF-generating model)
CHAPTER 13. CLASS DOCUMENTATION

13.182.2 Member Function Documentation

bool initialize_mapping ( ParLevIter pl_iter ) [virtual]

for KL models, the model is augmented with the random coeffs of the KL
May eventually take on init_comms and related operations. Also may want ide of build/update like DataFitSurrModel, eventually.
Reimplemented from Model.
References RandomFieldModel::covarianceForm, Model::estimate_message_lengths(), RandomFieldModel::expansionForm, RandomFieldModel::fieldRealizationId, RandomFieldModel::get_field_data(), RandomFieldModel::identify_field_model(), RecastModel::initialize_mapping(), RandomFieldModel::initialize_recast(), RandomFieldModel::initialize_rf_coeffs(), RandomFieldModel::mappingInitialized, and RandomFieldModel::rf_suite_identify_field_model().

void get_field_data ( ) [protected]

Source data generation: get the field data either from file or simulation by running the DACE Iterator. Populates rfBuildData.
Populate rfBuildData
References Iterator::all_responses(), Iterator::all_samples(), Dakota::copy_data(), Model::cv(), RandomFieldModel::daceIterator, RandomFieldModel::expansionForm, Iterator::is_null(), Iterator::num_samples(), Model::numFns, Dakota::read_sized_data(), RandomFieldModel::rfBuildData, RandomFieldModel::rfBuildVars, Iterator::run(), and RecastModel::subModel.
Referenced by RandomFieldModel::initialize_mapping().

void rf_suite_identify_field_model ( ) [protected]

Generate field representation: utilize RF Suite.
Alternative to below function when using RFSuite.
References RandomFieldModel::actualReducedRank, and RandomFieldModel::requestedReducedRank.
Referenced by RandomFieldModel::initialize_mapping().

void initialize_recast ( ) [protected]

Initialize the base class RecastModel with reduced space variable sizes.
Initialize the recast model to augment the uncertain variables with actualReducedRank additional N(0,1) variables, with no response function mapping (for now).
References RandomFieldModel::actualReducedRank, Model::aleatory_distribution_parameters(), Model::current_response(), Model::cv(), Model::div(), Model::drv(), Model::dsv(), Response::function_gradients(), Response::function_hessians(), RecastModel::init_maps(), RecastModel::init_sizes(), Model::num_nonlinear_ineq_constraints(), Model::num_primary_fns(), Model::num_secondary_fns(), Model::numFns, RandomFieldModel::rfmInstance, RandomFieldModel::set_mapping(), RecastModel::subModel, RandomFieldModel::variables_resize(), and RandomFieldModel::vars_mapping().
Referenced by RandomFieldModel::initialize_mapping().

SizetArray variables_resize ( ) [protected]

Create a variables components totals array with the reduced space size for continuous variables.
Create a variables components totals array with the reduced space size for continuous variables TODO: augment normal uncVars for KL case.
References RandomFieldModel::actualReducedRank, SharedVariablesData::components_totals(), Model::current_variables(), RandomFieldModel::expansionForm, Variables::shared_data(), RecastModel::subModel, and Dakota::svd().

Referenced by RandomFieldModel::initialize_recast().

`void initialize_rf_coeffs ( ) [protected]`

For KL models, augment the subModel’s uncertain variables with additional N(0,1) variables; set up Aleatory-DistParams for the N(0,1)’s.

Initialize the aleatory dist params for the KL coeffs

References RandomFieldModel::actualReducedRank, Model::aleatory_distribution_parameters(), Variables::continuous_variable_label(), Model::continuous_variable_labels(), Model::currentVariables, RandomFieldModel::expansionForm, and RecastModel::subModel.

Referenced by RandomFieldModel::initialize_mapping().

`void vars_mapping ( const Variables & recast_xi_vars, Variables & sub_model_x_vars ) [static], [protected]`

map the active continuous recast variables to the active submodel variables (linear transformation)

map the active continuous recast variables to the active submodel variables

References Variables::active_variables(), RandomFieldModel::actualReducedRank, Model::aleatory_distribution_parameters(), Variables::continuous_variables(), Model::cv(), Variables::discrete_int_variables(), Model::discrete_int_variables(), Variables::discrete_real_variables(), Model::discrete_real_variables(), Variables::discrete_string_variables(), Model::discrete_string_variables(), RandomFieldModel::expansionForm, RandomFieldModel::rfm_Instance, and RecastModel::subModel.

Referenced by RandomFieldModel::initialize_recast().

13.182.3 Member Data Documentation

**Iterator daceIterator [protected]**

String dataDirectoryBasename;

DACE Iterator to evaluate the RF generating model

Referenced by RandomFieldModel::get_field_data(), RandomFieldModel::init_dace_iterator(), and RandomFieldModel::validate_inputs().

**unsigned short expansionForm [protected]**

unsigned short analyticCovForm;

form of the RF representation (KL, PCA, ICA)

Referenced by RandomFieldModel::derived_evaluate(), RandomFieldModel::derived_evaluate_nowait(), RandomFieldModel::get_field_data(), RandomFieldModel::identify_field_model(), RandomFieldModel::initialize_mapping(), RandomFieldModel::initialize_rf_coeffs(), RandomFieldModel::resize_pending(), RandomFieldModel::variables_resize(), and RandomFieldModel::vars_mapping().

**int actualReducedRank [protected]**

command to run RF Suite

number of bases retained in decomposition
CHAPTER 13. CLASS DOCUMENTATION

Referenced by RandomFieldModel::generate_kl_realization(), RandomFieldModel::generate_pca_gp_realization(), RandomFieldModel::identify_field_model(), RandomFieldModel::initialize_recast(), RandomFieldModel::initialize_rf_coeffs(), RandomFieldModel::rf_suite_identify_field_model(), RandomFieldModel::variables_resize(), and RandomFieldModel::vars_mapping().

RandomFieldModel * rfmInstance [static], [protected]
static pointer to this class for use in static callbacks
    initialization of static needed by RecastModel
Referenced by RandomFieldModel::initialize_recast(), RandomFieldModel::RandomFieldModel(), and RandomFieldModel::vars_mapping().

bool mappingInitialized [protected]
the index of the active metaiterator-iterator parallelism level (corresponding to ParallelConfiguration::miPLIters) used at runtime
    track use of initialize_mapping() and finalize_mapping()
Referenced by RandomFieldModel::initialize_mapping(), RandomFieldModel::finalize_mapping(), RandomFieldModel::mapping_initialized(), and RandomFieldModel::resize_pending().

The documentation for this class was generated from the following files:

• RandomFieldModel.hpp
• RandomFieldModel.cpp

13.183 RealScale Struct Reference

Data structure for storing real-valued dimension scale.

Public Member Functions

• RealScale (const std::string &label, const RealVector &in_items, ScaleScope scope=ScaleScope::UNSHARED)
  Constructor that takes a RealVector.
• RealScale (const std::string &label, const RealArray &in_items, ScaleScope scope=ScaleScope::UNSHARED)
  Constructor that takes a RealArray.
• RealScale (const std::string &label, const Real *in_items, const int len, ScaleScope scope=ScaleScope::UNSHARED)
  Constructor that takes a pointer to Real and length.
• RealScale (const std::string &in_label, std::initializer_list< Real > in_items, ScaleScope in_scope=ScaleScope::UNSHARED)
  Constructor that takes an initializer_list.

Public Attributes

• std::string label
• ScaleScope scope
• RealVector items
13.184. RecastModel Class Reference

Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs.

Inheritance diagram for RecastModel:

```
     Model
    /     \
RecastModel
     |
ActiveSubspaceModel AdaptedBasisModel DataTransformModel ProbabilityTransformModel RandomFieldModel ScalingModel WeightingModel
```

Public Member Functions

  standard (full) constructor; assumes provided sizes and map functions are final and constructs all member data

- **RecastModel** (const `Model` &sub_model, const `SizetArray` &vars_comps_totals, const `BitArray` &all_relax_di, const `BitArray` &all_relax_dr, size_t num_recast_primary_fns, size_t num_recast_secondary_fns, size_t recast_secondary_offset, short recast_resp_order)

  alternate constructor; uses provided sizes to construct `Variables`, `Response` and `Constraints` so `Model` can be passed to an `Iterator`; requires subsequent `init_maps()` call.

- **RecastModel** (ProblemDescDB &problem_db, const `Model` &sub_model)

  Problem DB-based ctor, e.g., for use in subspace model; assumes mappings to be initialized later; only initializes based on sub-model.

- **RecastModel** (const `Model` &sub_model)

  lightest constructor used when transform sizes aren’t known at construct time; doesn’t initialize variables and responses, so this `Model` can’t be used to construct an `Iterator`; requires subsequent `init_sizes()` and `init_maps()` calls.
• RecastModel()
  destructor
• void init_sizes (const SizeTArray &vars, const SizeTArray &comps, const BitArray &all_relax_di, size_t num_recast_primary_fns, size_t num_recast_secondary_fns, size_t recast_secondary_offset, short recast RESP_order)
  update recast sizes and size Variables and Response members after alternate construction
• void init_maps (const SizeT2DArray &vars_map_indices, bool nonlinear_vars_mapping, void(*variables_map)(const Variables &recast_vars, Variables &sub_model_vars), void(*set_map)(const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set), void(*primary_resp_map)(const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response), void(*secondary_resp_map)(const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response))
  initialize recast indices and map callbacks after alternate construction
• void inverse_mappings (void(*inv_vars_map)(const Variables &sub_model_vars, Variables &recast_vars), void(*inv_set_map)(const Variables &sub_model_vars, const ActiveSet &sub_model_set, ActiveSet &recast_set), void(*inv_pri_resp_map)(const Variables &recast_vars, const Variables &sub_model_vars, const Response &recast_resp, Response &sub_model_response), void(*inv_sec_resp_map)(const Variables &recast_vars, const Variables &sub_model_vars, const Response &recast_resp, Response &sub_model_response))
  provide optional inverse mappings
• void transform_variables (const Variables &recast_vars, Variables &sub_model_vars)
  perform transformation of Variables (recast -> sub-model)
• void transform_set (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)
  into sub_model_set for use with subModel.
• void transform_response (const Variables &recast_vars, const Variables &sub_model_vars, const Response &sub_model_resp, Response &recast_resp)
  perform transformation of Response (sub-model -> recast)
• void transform_response_map (const IntResponseMap &old_resp_map, IntResponseMap &new_resp_map)
  invoke transform_response() on each response within old_resp_map to create new_resp_map
• void inverse_transform_variables (const Variables &sub_model_vars, Variables &recast_vars)
  perform inverse transformation of Variables (sub-model -> recast)
• void inverse_transform_set (const Variables &sub_model_vars, const ActiveSet &sub_model_set, ActiveSet &recast_set)
  into sub_model_set for use with subModel.
• void inverse_transform_response (const Variables &sub_model_vars, const Variables &recast_vars, const Response &recast_resp, Response &sub_model_resp)
  perform inverse transformation of Response (recast -> sub-model)
• void submodel_supports_derivative_estimation (bool sed_flag)
  override the submodel’s derivative estimation behavior
• String root_model_id ()
  Return the model ID of the “innermost” model. For all derived Models except RecastModels, return modelId. The RecastModel override returns the root_model_id() of the subModel.
• ActiveSet default_active_set ()
• void declare_sources ()
  Declare a model’s sources to the evaluationsDB.
Protected Member Functions

- bool initialize_mapping (ParLevLIter pl_iter)
  initialize model mapping, returns true if the variables size has changed

- bool finalize_mapping ()
  finalize model mapping, returns true if the variables size has changed

- size_t qoi () const
  return number of unique response functions (managing any aggregations)

- void derived_evaluate (const ActiveSet &set)
  portion of evaluate() specific to RecastModel (forward to subModel.evaluate())

- void derived_evaluate_nowait (const ActiveSet &set)
  portion of evaluate_nowait() specific to RecastModel (forward to subModel.evaluate_nowait())

- const IntResponseMap & derived_synchronize ()
  portion of synchronize() specific to RecastModel (forward to subModel.synchronize())

- const IntResponseMap & derived_synchronize_nowait ()
  portion of synchronize_nowait() specific to RecastModel (forward to subModel.synchronize_nowait())

- Iterator & subordinate_iterator ()
  return sub-iterator, if present, within subModel

- Model & subordinate_model ()
  return subModel

- void active_model_key (const UShortArray &mi_key)
  set key in subModel

- void clear_model_keys ()
  remove keys in subModel

- Model & surrogate_model ()
  return surrogate model, if present, within subModel

- void surrogate_model_key (unsigned short lf_model_index, unsigned short lf_soln_lev_index)
  set surrogate model key within subModel

- void surrogate_model_key (const UShortArray &lf_key)
  set surrogate model key within subModel

- const UShortArray & surrogate_model_key () const
  return surrogate model key from subModel

- Model & truth_model ()
  return truth model, if present, within subModel

- void truth_model_key (unsigned short hf_model_index, unsigned short hf_soln_lev_index)
  set truth model key within subModel

- void truth_model_key (const UShortArray &hf_key)
  set truth model key within subModel

- const UShortArray & truth_model_key () const
  return truth model key from subModel

- void derived_subordinate_models (ModelList &ml, bool recurse_flag)
  add subModel to list and recurse into subModel

- void resize_from_subordinate_model (size_t depth=std::numeric_limits<size_t>::max())
pass request to subModel if recursing and then resize from its results

- **void update_from_subordinate_model** (size_t depth=std::numeric_limits<size_t>::max())
  pass request to subModel if recursing and then update from its results

- **Interface & derived_interface** ()
  return subModel interface

- **size_t solution_levels** () const
  return size of subModel::solnControlCostMap

- **void solution_level_index** (unsigned short lev_index)
  activate entry in subModel::solnControlCostMap

- **unsigned short solution_level_index** () const
  return active entry in subModel::solnControlCostMap

- **RealVector solution_level_costs** () const
  return cost estimates from subModel::solnControlCostMap

- **Real solution_level_cost** () const
  return active cost estimate from subModel::solnControlCostMap

- **void primary_response_fn_weights** (const RealVector &wts, bool recurse_flag=true)
  set the relative weightings for multiple objective functions or least squares terms and optionally recurses into sub-Model

- **void surrogate_function_indices** (const IntSet &surr_fn_indices)
  update the subModel's surrogate response function indices (DataFitSurrModel::surrogateFnIndices)

- **void surrogate_response_mode** (short mode)
  update the subModel's surrogate response mode (SurrogateModel::responseMode)

- **void link_multilevel_approximation_data** ()
  link SurrogateData instances within the subModel

- **short correction_type** ()
  retrieve subModel's correction type

- **void correction_type** (short corr_type)
  update subModel's correction type

- **const RealVector & error_estimates** ()
  retrieve error estimates corresponding to the subModel

- **void build_approximation** ()
  builds the subModel approximation

- **bool build_approximation** (const Variables &vars, const IntResponsePair &response_pr)
  builds the subModel approximation

- **void rebuild_approximation** ()
  updates a subModel approximation

- **void update_approximation** (bool rebuild_flag)
  replaces data in the subModel approximation

- **void update_approximation** (const Variables &vars, const IntResponsePair &response_pr, bool rebuild_flag)
  replaces data in the subModel approximation

- **void update_approximation** (const VariablesArray &vars_array, const IntResponseMap &resp_map, bool rebuild_flag)
  replaces data in the subModel approximation
void append_approximation (bool rebuild_flag)
  appends data to the subModel approximation

void append_approximation (const Variables &vars, const IntResponsePair &response_pr, bool rebuild_flag)
  appends data to the subModel approximation

void append_approximation (const VariablesArray &vars_array, const IntResponseMap &resp_map, bool rebuild_flag)
  appends data to the subModel approximation

void pop_approximation (bool save_surr_data, bool rebuild_flag=false)
  remove the previous data set addition to a surrogate (e.g., due to a previous append_approximation() call); flag manages storing of surrogate data for use in a subsequent push_approximation() call

void push_approximation ()
  push a previous approximation data state; reverse of pop_approximation

bool push_available ()
  query for whether a trial increment is restorable within a surrogate

void finalize_approximation ()
  finalize an approximation by applying all previous trial increments

void combine_approximation ()
  combine the current approximation with previously stored data sets

void combined_to_active (bool clear_combined=true)
  promote the combined approximation into the active approximation

void clear_inactive ()
  clear inactive approximations (finalization + combination completed)

std::vector< Approximation > & approximations ()
  retrieve the set of Approximations from the subModel

const RealVectorArray & approximation_coefficients (bool normalized=false)
  retrieve the approximation coefficients from the subModel

void approximation_coefficients (const RealVectorArray &approx_coeffs, bool normalized=false)
  set the approximation coefficients within the subModel

const RealVector & approximation_variances (const Variables &vars)
  retrieve the approximation variances from the subModel

const Pecos::SurrogateData & approximation_data (size_t fn_index, size_t d_index=NPOS)
  retrieve the approximation data from the subModel

void component_parallel_mode (short mode)
  RecastModel only supports parallelism in subModel, so this virtual function redefinition is simply a sanity check.

size_t mi_parallel_level_index () const
  return subModel’s MI parallel level index

short local_eval_synchronization ()
  return subModel local synchronization setting

int local_eval_concurrency ()
  return subModel local evaluation concurrency

bool derived_master_overload () const
  flag which prevents overloading the master with a multiprocessor evaluation (request forwarded to subModel)

IntIntPair estimate_partition_bounds (int max_eval_concurrency)
estimate the minimum and maximum partition sizes that can be utilized by this Model

• void derived_init_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  set up RecastModel for parallel operations (request forwarded to subModel)

• void derived_init_serial ()
  set up RecastModel for serial operations (request forwarded to subModel).

• void derived_set_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)
  set active parallel configuration within subModel

• void derived_free_communicators (ParLevLIter pl_iter, int max_eval_concurrency)
  deallocate communicator partitions for the RecastModel (request forwarded to subModel)

• void serve_run (ParLevLIter pl_iter, int max_eval_concurrency)
  Service subModel job requests received from the master. Completes when a termination message is received from stop_servers().

• void stop_servers ()
  executed by the master to terminate subModel server operations when RecastModel iteration is complete.

• void inactive_view (short view, bool recurse_flag=true)
  update the Model’s inactive view based on higher level (nested) context and optionally recurse into subModel

• const String & interface_id () const
  return the subModel interface identifier

• bool evaluation_cache (bool recurse_flag=true) const
  if recurse_flag, return the subModel evaluation cache usage

• bool restart_file (bool recurse_flag=true) const
  if recurse_flag, return the subModel restart file usage

• int derived_evaluation_id () const
  return the current evaluation id for the RecastModel

• void set_evaluation_reference ()
  set the evaluation counter reference points for the RecastModel (request forwarded to subModel)

• void fine_grained_evaluation_counters ()
  request fine-grained evaluation reporting within subModel

• void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const
  print the evaluation summary for the RecastModel (request forwarded to subModel)

• void warm_start_flag (const bool flag)
  set the warm start flag, including the orderedModels

• void eval_tag_prefix (const String &eval_id_str)
  set the hierarchical eval ID tag prefix

• bool db_lookup (const Variables &search_vars, const ActiveSet &search_set, Response &found Resp)
  RecastModel may need to map variables, asv before DB lookup, or responses after lookup.

• bool init_variables (const SizetArray &vars_comps_totals, const BitArray &all_relax_di, const BitArray &all_relax_dr)
  initialize currentVariables and related info from the passed size/type info

• void init_response (size_t num_recast_primary_fns, size_t num_recast_secondary_fns, short recast_resp_order, bool reshape_vars)
  initialize currentResponse from the passed size info

• void reshape_response (size_t num_recast_primary_fns, size_t num_recast_secondary_fns)
Reshape the RecastModel Response, assuming no change in variables or derivative information.

- void init_constraints (size_t num_recast_secondary_fns, size_t recast_secondary_offset, bool reshape_vars)
  
  initialize userDefinedConstraints from the passed size info

### Static Protected Member Functions

- static short response_order (const Model &sub_model)
  
  helper to compute the recast response order during member initialization
- static String recast_model_id (const String &root_id, const String &type)
  
  Generate a model id for recast models.

### Protected Attributes

- Model subModel
  
  the sub-model underlying the transformations
- int recastModelEvalCntr
  
  local evaluation id counter used for id mapping
- IntActiveSetMap recastSetMap
  
  map of recast active set passed to derived_evaluate_nowait(). Needed for currentResponse update in synchronization routines.
- IntVariablesMap recastVarsMap
  
  map of recast variables used by derived_evaluate_nowait(). Needed for primaryRespMapping() and secondaryRespMapping() in synchronization routines.
- IntVariablesMap subModelVarsMap
  
  map of subModel variables used by derived_evaluate_nowait(). Needed for primaryRespMapping() and secondaryRespMapping() in synchronization routines.
- IntResponseMap recastResponseMap
  
  map of recast responses used by RecastModel::derived_synchronize() and RecastModel::derived_synchronize_nowait()
- IntIntMap recastIdMap
  
  mapping from subModel evaluation ids to RecastModel evaluation ids

### Static Protected Attributes

- static StringStringPairIntMap recastModelIdCounters
  
  Counters for naming RecastModels.

### Private Member Functions

- void initialize_data_from_submodel ()
  
  code shared among constructors to initialize base class data from submodel
- void update_from_model (Model &model)
  
  update current variables/labels/bounds/targets from subModel
- void resize_response_mapping ()
  
  resize {primary,secondary}MapIndices and nonlinearRespMapping to synchronize with subModel sizes
Private Attributes

- **Sizet2DArray varsMapIndices**
  
  For each subModel variable, identifies the indices of the recast variables used to define it (maps RecastModel variables to subModel variables; data is packed with only the variable indices employed rather than a sparsely filled \( N_{sm} \times N_r \) matrix).

- **bool nonlinearVarsMapping**
  
  Boolean set to true if the variables mapping involves a nonlinear transformation. Used in transform_set() to manage the requirement for gradients within the Hessian transformations. This does not require a BoolDeque for each individual variable, since response gradients and Hessians are managed per function, not per variable.

- **bool respMapping**
  
  Set to true if non-NULL primaryRespMapping or secondaryRespMapping are supplied

- **Sizet2DArray primaryRespMapIndices**
  
  For each recast primary function, identifies the indices of the subModel functions used to define it (maps subModel response to RecastModel Response).

- **Sizet2DArray secondaryRespMapIndices**
  
  For each recast secondary function, identifies the indices of the subModel functions used to define it (maps subModel response to RecastModel response).

- **BoolDequeArray nonlinearRespMapping**
  
  Array of BoolDeques, one for each recast response function. Each BoolDeque defines which subModel response functions contribute to the recast function using a nonlinear mapping. Used in transform_set() to augment the subModel function value/gradient requirements.

- **RealVector mappedErrorEstimates**
  
  Mapping of subModel.error_estimates() through response mappings

- **void** (const Variables &recast_vars, Variables &sub_model_vars)

  Holds pointer for variables mapping function passed in ctor/initialize

- **void** (const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set)

  Holds pointer for set mapping function passed in ctor/initialize

- **void** (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)

  Holds pointer for primary response mapping function passed in ctor/initialize

- **void** (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response)

  Holds pointer for secondary response mapping function passed in ctor/initialize

- **void** (const Variables &sub_model_vars, Variables &recast_vars)

  Holds pointer for optional inverse variables mapping function passed in inverse_mappings()

- **void** (const Variables &sub_model_vars, const ActiveSet &sub_model_set, ActiveSet &recast_set)

  Holds pointer for optional inverse set mapping function passed in inverse_mappings()

- **void** (const Variables &recast_vars, const Variables &sub_model_vars, const Response &recast_resp, Response &sub_model_resp)

  Holds pointer for optional inverse primary response mapping function passed in inverse_mappings()

- **void** (const Variables &recast_vars, const Variables &sub_model_vars, const Response &recast_resp, Response &sub_model_resp)

  Holds pointer for optional inverse secondary response mapping function passed in inverse_mappings()
13.184. RECASTMODEL CLASS REFERENCE

Additional Inherited Members

13.184.1 Detailed Description

Derived model class which provides a thin wrapper around a sub-model in order to recast the form of its inputs and/or outputs.

The RecastModel class uses function pointers to allow recasting of the subModel input/output into new problem forms. For example, this is used to recast SBO approximate subproblems, multiobjective and least-squares reductions, and variable/response.

For now, making the assumption that variables mappings are ordered by submodel active continous, discrete int, discrete string, discrete real variables, even though all current use cases are continuous only.

When not using the standard (full) constructor, client code must make sure to complete initialization before using the RecastModel’s mapping functions. Initialization steps:

1. sub model (all ctors do this)
2. initSizes: once known, size Variables, Response, Constraints (full and intermediate ctor do this)
3. initMaps: set indices and callback pointers (only full ctor does this)

13.184.2 Constructor & Destructor Documentation

RecastModel ( const Model & subModel, const Sizet2DArray & vars.map_indices, const SizetArray & vars.comps.totals, const BitArray & all.relax.ai, const BitArray & all.relax.dr, bool nonlinear.vars.mapping, void(*)(const Variables & recast.vars, Variables & subModel.vars) variables.map, void(*)(const Variables & recast.vars, const ActiveSet & recast.set, ActiveSet & subModel.set) set.map, const Sizet2DArray & primary.resp.mapindices, const Sizet2DArray & secondary.resp.mapindices, size_t recast.secondary.offset, short recast.resp.order, const BoolDequeArray & nonlinear.resp.mapping, void(*)(const Variables & subModel.vars, const Variables & recast.vars, const Response & subModel.response, Response & recast.response) primary.resp.map, void(*)(const Variables & subModel.vars, const Variables & recast.vars, const Response & subModel.response, Response & recast.response) secondary.resp.map )

standard (full) constructor; assumes provided sizes and map functions are final and constructs all member data

Default recast model constructor. Requires full definition of the transformation; if any mappings are NULL, they are assumed to remain so in later initialization or updates. Parameter vars.comps.totals indicates the number of each type of variable \(4\) types \(x\) \(3\) domains in the recast variable space. Note: recast.secondary.offset is the start index for equality constraints, typically num nonlinear ineq constraints.

References Dakota::abort_handler(), Response::copy(), Variables::copy(), Model::current_response(), Model::currentVariables(), Model::currentResponse, Variables::cv(), RecastModel::init_constraints(), RecastModel::init_response(), RecastModel::init_variables(), RecastModel::initialize_data_from_submodel(), Model::modelId, Model::modelType, RecastModel::nonlinearRespMapping, Response::num_functions(), Model::numDerivVars, Model::numFns, RecastModel::primaryRespMapIndices, RecastModel::primaryRespMapping, RecastModel::recast_model_id(), RecastModel::respMapping, RecastModel::root_model_id(), RecastModel::secondaryRespMapIndices, RecastModel::secondaryRespMapping, RecastModel::subModel, Model::supportsEstimDerivs, and RecastModel::variablesMapping.

RecastModel ( const Model & subModel, const SizetArray & vars.comps.totals, const BitArray & all.relax.ai, const BitArray & all.relax.dr, size_t num.recast.primary.fns, size_t num.recast.secondary.fns, size_t recast.secondary.offset, short recast.resp.order )

alternate constructor; uses provided sizes to construct Variables, Response and Constraints so Model can be passed to an Iterator; requires subsequent initMaps() call.
CHAPTER 13. CLASS DOCUMENTATION

This alternate constructor defers initialization of the function pointers until a separate call to initialize(), and accepts the minimum information needed to construct currentVariables, currentResponse, and userDefined-Constraints. The resulting model is sufficiently complete for passing to an Iterator. Parameter vars_comps_totals indicates the number of each type of variable \{4 types\} x \{3 domains\} in the recast variable space. Note: recast_secondary_offset is the start index for equality constraints, typically num nonlinear ineq constraints.

References RecastModel::init_sizes(), RecastModel::initialize_data_from_submodel(), Model::modelId, Model::modelType, RecastModel::recast_model_id(), RecastModel::root_model_id(), and Model::supportsEstimDerivs.

13.184.3 Member Function Documentation

void init_maps ( const Sizet2DArray & vars_map_indices, bool nonlinear_vars_mapping, void(*)(const Variables &recast_vars, Variables &sub_model_vars) variables_map, void(*)(const Variables &recast_vars, const ActiveSet &recast_set, ActiveSet &sub_model_set) set_map, const Sizet2DArray & primary_resp_map_indices, const Sizet2DArray & secondary_resp_map_indices, const BoolDequeArray & nonlinear_resp_mapping, void(*)(const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response) primary_resp_map, void(*)(const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &recast_response) secondary_resp_map )

initialize recast indices and map callbacks after alternate construction

This function is used for late initialization of the recasting functions. It is used in concert with the alternate constructor.

Referenced by NonDGlobalInterval::core_run(), NonDLocalInterval::core_run(), DataTransformModel::DataTransformModel(), RandomFieldModel::initialize_recast(), AdaptedBasisModel::initialize_recast(), ActiveSubspaceModel::initialize_recast(), EffGlobalMinimizer::minimize_surrogates_on_model(), NonDLocalReliability::mpp_search(), NonDGlobalReliability::optimize_gaussian_process(), ProbabilityTransformModel::ProbabilityTransformModel(), ScalingModel::ScalingModel(), and WeightingModel::WeightingModel().

void derived_evaluate ( const ActiveSet & set ) [protected], [virtual]

portion of evaluate() specific to RecastModel (forward to subModel.evaluate())

The RecastModel is evaluated by an Iterator for a recast problem formulation. Therefore, the currentVariables, incoming active set, and output currentResponse all correspond to the recast inputs/outputs.

Reimplemented from Model.

References Response::active_set(), Model::current_response(), Model::current_variables(), Model::currentResponse, Model::currentVariables, Model::evaluate(), RecastModel::recastModelEvalCntr, RecastModel::respMapping, RecastModel::subModel, RecastModel::transform_response(), RecastModel::transform_set(), RecastModel::transform_variables(), and Response::update().

Referenced by AdaptedBasisModel::derived_evaluate(), DataTransformModel::derived_evaluate(), ActiveSubspaceModel::derived_evaluate(), and RandomFieldModel::derived_evaluate().

void eval_tag_prefix ( const String & eval_id_str ) [inline], [protected], [virtual]

set the hierarchical eval ID tag prefix

RecastModel just forwards any tags to its subModel

Reimplemented from Model.

References Model::eval_tag_prefix(), and RecastModel::subModel.
void update_from_model ( Model & model ) [private]

update current variables/labels/bounds/targets from subModel

Update inactive values and labels in currentVariables and inactive bound constraints in userDefinedConstraints from variables and constraints data within subModel.

13.185.1 Detailed Description

The ReducedBasis class is used to ... (TODO - RWH)

Class to manage data-driven dimension reduction. The passed matrix with num_observations n rows and num_responses p columns contains realizations of a set of responses. The class optionally centers the matrix by the column means. Stores a singular value decomposition of the passed data matrix X = U*S*V', which can also be used for PCA, where we seek an eigendecomposition of the covariance: X'*X = V*D*V'^{-1} = V*S^2*V'

Additional Inherited Members

13.186.1  Detailed Description

Derived class within the Constraints hierarchy which employs relaxation of discrete variables. Derived variable constraints classes take different views of the design, uncertain, and state variable types and the continuous and discrete domain types. The RelaxedVarConstraints derived class combines continuous and discrete domain types through integer relaxation. The branch and bound method uses this approach (see Variables::get_variables(problem_db) for variables type selection; variables type is passed to the Constraints constructor in Model).

13.186.2  Constructor & Destructor Documentation

RelaxedVarConstraints ( const ProblemDescDB & problem_db, const SharedVariablesData & svd )

standard constructor

In this class, a relaxed data approach is used in which continuous and discrete arrays are combined into a single continuous array (integrality is relaxed; the converse of truncating reals is not currently supported but could be in the future if needed). Iterators which use this class include: BranchBndOptimizer.

#### 13.187.3 Member Function Documentation

**void read_tabular ( std::istream & s, unsigned short vars_part = ALL_VARS ) [protected], [virtual]**

Presumes variables object is appropriately sized to receive data

Reimplemented from Variables.

References RelaxedVariables::read_core().

**void read_core ( std::istream & s, Reader read_handler, unsigned short vars_part ) [protected]**

Implementation of reading various formats using the specified read handler, accounting for reordering due to relaxation.

Reordering is required in all read/write cases that will be visible to the user since all derived vars classes should use the same ordering for clarity. Neutral file I/O, binary streams, and packed buffers do not need to reorder (so long as read/write are consistent) since this data is not intended for public consumption.

  return all function Hessians as Teuchos::Views (shallow copies) for accessing the i-th matrix within a const matrix array
• void function_hessian (const RealSymMatrix &fn_hessian, size_t i)
  set a function Hessian
• void function_hessians (const RealSymMatrixArray &fn_hessians)
  set all function Hessians
• RealVector field_values_view (size_t i) const
  return const field values
• RealVector field_values_view (size_t i)
  return a "view" of a field value for updating in place
• void field_values (const RealVector &field_val, size_t i)
  set a field value
• RealMatrix field_coords_view (size_t i)
  return a "view" of a field value's coordinates
• const RealMatrix field_coords_view (size_t i) const
  return a const "view" of a field value's coordinates
• void field_coords (const RealMatrix &field_coords, size_t i)
  set a field value's coordinates
• RealMatrix field_gradients_view (size_t i) const
  return a view of the gradients of each field element
• RealSymMatrixArray field_hessians_view (size_t i) const
  return a view of the hessians of each field element
• const IntVector & field_lengths () const
  return the field lengths from sharedRespData
• void field_lengths (const IntVector &field_lens)
  set the field lengths within sharedRespData
• const IntVector & num_coords_per_field () const
  return the num_coords_per_field from sharedRespData
• void set_coord_values (const RealMatrix &coord_values, const size_t i)
  set the coordinate values per field

- const RealMatrix & get_coord_values (const size_t i) const
  return the coordinate values per field
- const StringArray & function_Labels () const
  return the fine-grained (unrolled) response function identifier strings from sharedRespData
- void function_labels (const StringArray &labels)
  set the fine-grained (unrolled) response function identifier strings within sharedRespData
- const StringArray & field_group_labels ()
  return the user-provided field group labels instead of the unrolled labels available through function_labels()
- void read (std::istream &s, const unsigned short format=FLEXIBLE_RESULTS)
  read a response object of specified format from an std::istream
- void write (std::ostream &s) const
  write a response object to an std::ostream
- void read.annotated (std::istream &s)
  read a response object in annotated format from an std::istream
- void write.annotated (std::ostream &s) const
  write a response object in annotated format to an std::ostream
- void read.tabular (std::istream &s)
  read responseRep::functionValues in tabular format from an std::istream
- void write.tabular (std::ostream &s) const
  write responseRep::functionValues in tabular format to an std::ostream
- void write.tabular_labels (std::ostream &s) const
  write the labels to a tabular data stream
- void read (MPIUnpackBuffer &s)
  read a response object from a packed MPI buffer
- void write (MPIPackBuffer &s) const
  write a response object to a packed MPI buffer
- Response copy (bool deep_srd=false) const
  return a deep response copy of the contained responseRep for use in history mechanisms (SharedResponseData uses a shallow copy by default)
- int data_size ()
  return the number of doubles active in response. Used for sizing double* response_data arrays passed into read_data and write_data.
- void read_data (double *response_data)
  read from an incoming double* array
- void write_data (double *response_data)
  write to an incoming double* array
- void overlay (const Response &response)
  add incoming response to functionValues/Gradients/Hessians
- void update (const Response &response)
  Used in place of operator= when only results data updates are desired (functionValues/functionGradients/function-Hessians are updated, ASV/labels/id's/etc. are not). Care is taken to allow different derivative array sizing between the two response objects.
- void update (const RealVector &source_fn_vals, const RealMatrix &source_fn_grads, const RealSymMatrix-Array &source_fn_hessians, const ActiveSet &source_set)
Overloaded form which allows update from components of a response object. Care is taken to allow different derivative array sizing.

- `void update_partial` (size_t start_index_target, size_t num_items, const Response &response, size_t start_index_source)

  partial update of this response object from another response object. The response objects may have different numbers of response functions.

- `void update_partial` (size_t start_index_target, size_t num_items, const RealVector &source_fn_vals, const RealMatrix &source_fn_grads, const RealSymMatrixArray &source_fn_hessians, const ActiveSet &source_set, size_t start_index_source)

  Overloaded form which allows partial update from components of a response object. The response objects may have different numbers of response functions.

- `void reshape` (size_t num_fns, size_t num_params, bool grad_flag, bool hess_flag)

  reshapes response data arrays

- `void reset`

  resets all response data to zero

- `void reset_inactive`

  resets all inactive response data to zero

- `bool is_null` () const

  function to check responseRep (does this handle contain a body)

- `virtual void set_scalar_covariance` (RealVector &scalars)

  method to set the covariance matrix defined for ExperimentResponse

- `virtual const ExperimentCovariance & experiment_covariance` () const

  retrieve the ExperimentCovariance structure

- `virtual void set_full_covariance` (std::vector<RealMatrix> &matrices, std::vector<RealVector> &diagonals, RealVector &scalars, IntVector matrix_map_indices, IntVector diagonal_map_indices, IntVector scalar_map_indices)

  method to set the full covariance matrices for ExperimentResponse

- `virtual Real apply_covariance` (const RealVector &residuals) const

  method to compute the triple product v' * inv(C) * v.

- `virtual void apply_covariance_inv_sqrt` (const RealVector &residuals, RealVector &weighted_residuals) const

  method to compute (v' * inv(C) ^ 1/2), to compute weighted residual

- `virtual void apply_covariance_inv_sqrt` (const RealMatrix &gradients, RealMatrix &weighted_gradients) const

- `virtual void apply_covariance_inv_sqrt` (const RealSymMatrixArray &hessians, RealSymMatrixArray &weighted_hessians) const

- `virtual void get_covariance_diagonal` (RealVector &diagonal) const

- `virtual Real covariance_determinant` () const

  covariance determinant for one experiment (default 1.0)

- `virtual Real log_covariance_determinant` () const

  log of covariance determinant for one experiment (default 0.0)
Protected Member Functions

- `Response (BaseConstructor, const Variables &vars, const ProblemDescDB &problem_db)`
  
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- `Response (BaseConstructor, const SharedResponseData &srd, const ActiveSet &set)`
  
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- `Response (BaseConstructor, const ActiveSet &set)`
  
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- `Response (BaseConstructor, const SharedResponseData &srd)`
  
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- `virtual void copy_rep (Response *source_resp_rep)`
  
  Implementation of data copy for `Response` letters (specialized by some derived letter types); pulls base class data from `source_resp_rep` into the this object.

Protected Attributes

- `SharedResponseData sharedRespData`
  
  reference-counted instance of shared response data: id’s, labels

- `RealVector functionValues`
  
  abstract set of response functions

- `RealMatrix functionGradients`
  
  first derivatives of the response functions

- `RealSymMatrixArray functionHessians`
  
  second derivatives of the response functions

- `IntRealMatrixMap fieldCoords`
  
  coordinates for the field values

- `ActiveSet responseActiveSet`
  
  copy of the `ActiveSet` used by the `Model` to generate a `Response` instance

Private Member Functions

- `template<class Archive, typename OrdinalType, typename ScalarType>
  void write_sdm_col (Archive &ar, int col, const Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &sdm) const`
  
  write a column of a SerialDenseMatrix

- `template<class Archive, typename OrdinalType, typename ScalarType>
  void read_sdm_col (Archive &ar, int col, Teuchos::SerialDenseMatrix< OrdinalType, ScalarType > &sdm)`
  
  read a column of a SerialDenseMatrix

- `template<class Archive>
  void load (Archive &ar, const unsigned int version)`
  
  read a `Response` from an archive<class Archive>
CHAPTER 13. CLASS DOCUMENTATION

- template<class Archive>
  void load_rep(Archive &ar, const unsigned int version)
  
  *read a Response letter object from an archive*

- template<class Archive>
  void save(Archive &ar, const unsigned int version) const
  
  *write a Response to an archive*

- template<class Archive>
  void save_rep(Archive &ar, const unsigned int version) const
  
  *write a Response letter object to an archive*

- BOOST.Serialization.Split.Member() Response *get_response(short type)
  
  *Used by standard envelope constructor to instantiate a new letter class.*

- Response *get_response(const SharedResponseData &srd, const ActiveSet &set) const
  
  *Used by alternate envelope constructor to instantiate a new letter class.*

- Response *get_response(short type, const ActiveSet &set) const
  
  *Used by alternate envelope constructor to instantiate a new letter class.*

- Response *get_response(const SharedResponseData &srd) const
  
  *Used by copy() to instantiate a new letter class.*

- Response *get_response(short type) const
  
  *Used by read functions to instantiate a new letter class.*

- void read_annotated_rep(std::istream &s)
  
  *read a letter object in annotated format from an std::istream*

- void write_annotated_rep(std::ostream &s) const
  
  *write a letter object in annotated format to an std::ostream*

- void read_rep(MPIUnpackBuffer &s)
  
  *read a letter object from a packed MPI buffer*

- void write_rep(MPIPackBuffer &s) const
  
  *write a letter object to a packed MPI buffer*

- void shape_rep(const ActiveSet &set, bool initialize=true)
  
  *resizes the representation’s containers*

- void reshape_rep(size_t num_fns, size_t num_params, bool grad_flag, bool hess_flag)
  
  *resizes the representation’s containers*

- void read_gradients(std::istream &s, const ShortArray &asv, std::ostringstream &error)
  
  *Read gradients from a freeform stream. Insert error messages.*

- void read_hessians(std::istream &s, const ShortArray &asv, std::ostringstream &error)
  
  *Read Hessians from a freeform stream. Insert error messages.*

- void read_labeled_fn_vals(std::istream &s, const ShortArray &asv, std::ostringstream &errors)
  
  *Read function values from an annotated stream. Insert error messages.*

- void read_flexible_fn_vals(std::istream &s, const ShortArray &asv, std::ostringstream &errors)
  
  *Read function values from a stream in a "flexible" way – ignoring any labels. Insert error messages into errors stream.*

- bool failure_reported(std::istream &s)
  
  *Check for FAIL in stream.*
13.189. **RESTARTWRITER CLASS REFERENCE**

**Private Attributes**

- const Variables & vars
- const Variables const ProblemDescDB &problem_db const
- Response * responseRep
  
  *pointer to the body (handle-body idiom)*
- int referenceCount
  
  *number of handle objects sharing responseRep*

**Friends**

- class boost::serialization::access
- bool operator== (const Response &resp1, const Response &resp2)
  
  *equality operator*
- bool operator!= (const Response &resp1, const Response &resp2)
  
  *inequality operator*

13.188.1 **Detailed Description**

Container class for response functions and their derivatives. **Response** provides the enveloper base class.

The **Response** class is a container class for an abstract set of functions (functionValues) and their first (function-Gradients) and second (functionHessians) derivatives. The functions may involve objective and constraint functions (optimization data set), least squares terms (parameter estimation data set), or generic response functions (uncertainty quantification data set). For memory efficiency, it employs the "letter-envelope idiom” approach to reference counting and representation sharing (see Coplien "Advanced C++"), for which the base **Response** class serves as the envelope and one of its derived classes serves as the letter.

13.188.2 **Member Data Documentation**

**RealMatrix functionGradients** [protected]

First derivatives of the response functions

The gradient vectors (plural) are column vectors in the matrix (singular) with (row, col) = (variable index, response fn index).

Referenced by Response::field_gradients_view(), Response::function_gradient(), Response::function_gradient_copy(), Response::function_gradient_view(), Response::function_gradients(), and Response::function_gradients_view().

The documentation for this class was generated from the following file:

- DakotaResponse.hpp

13.189 **RestartWriter Class Reference**

**Public Member Functions**

- **RestartWriter ()**
  
  *optional default ctor allowing a non-outputting RestartWriter*
- **RestartWriter (const String &write_restart_filename)**
typical ctor taking a filename; this class encapsulates the output stream

- **RestartWriter** (std::ostream &write_restart_stream)
  alternate ctor taking a stream, helpful for testing; assumes client manages the output stream
- **const String & filename ()**
  output filename for this writer
- **void append_prp (const ParamResponsePair &prp_in)**
  add the passed pair to the restart file
- **void flush ()**
  flush the restart stream so we have a complete restart record should Dakota abort

### Private Member Functions

- **RestartWriter** (const RestartWriter &)
  copy constructor is disallowed due to file stream
- **const RestartWriter & operator= (const RestartWriter &)**
  assignment is disallowed due to file stream

### Private Attributes

- **String restartOutputFilename**
  the name of the restart output file
- **std::ofstream restartOutputFS**
  Binary stream to which restart data is written.
- **std::unique_ptr< boost::archive::binary_oarchive > restartOutputArchive**
  Binary output archive to which data is written (pointer since no default ctor for oarchive and may not be initialized).

#### 13.189.1 Detailed Description

Component for writing restart files. Creation and destruction of archive and associated stream are managed here. The documentation for this class was generated from the following files:

- OutputManager.hpp
- OutputManager.cpp

### 13.190 ResultAttribute< T > Struct Template Reference

Data structure for a single Real, String, or int valued attribute.

### Public Member Functions

- **ResultAttribute** (const String &label, const T &value)
  Construct an attribute.
Public Attributes

- **String label**
  
  *Key for the attribute.*

- **T value**

  *Value for the attribute.*

### 13.190.1 Detailed Description

**template<typename T> struct Dakota::ResultAttribute<T>**

Data structure for a single Real, String, or int valued attribute.

The documentation for this struct was generated from the following file:

- dakota_results_types.hpp

### 13.191 ResultsDBAny Class Reference

Inheritance diagram for ResultsDBAny:

```
ResultsDBBase

ResultsDBAny
```

Public Member Functions

- **ResultsDBAny** (const String &filename)

- **void insert** (const StrStrSizet &iterator_id, const std::string &data_name, const boost::any &result, const MetaDataType &metadata) override

  record addition with metadata map

- **void flush** () const

  Write data to file.

- **void insert** (const StrStrSizet &iterator_id, const StringArray &location, const boost::any &data, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray(), const bool &transpose=false) override

  insert an arbitrary type (RealMatrix) with metadata

- **void allocate_vector** (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &len, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())

  Pre-allocate a vector and (optionally) attach dimension scales and attributes. Insert elements using insert_into(...)

- **void allocate_matrix** (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &num_rows, const int &num_cols, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())

  Pre-allocate a matrix and (optionally) attach dimension scales and attributes. Insert rows or columns using insert_into(...)
• void insert_into (const StrStrSizet &iterator_id, const StringArray &location, const boost::any &data, const int &index, const bool &row)
  Insert a row or column into a pre-allocated matrix.
• void add_metadata_to_method (const StrStrSizet &iterator_id, const AttributeArray &attrs) override
  Add key:value metadata to method.
• void add_metadata_to_execution (const StrStrSizet &iterator_id, const AttributeArray &attrs) override
  Add key:value metadata to execution.
• void add_metadata_to_object (const StrStrSizet &iterator_id, const StringArray &location, const AttributeArray &attrs) override
  Associate key:value metadata with the object at the location.
• void add_metadata_to_study (const AttributeArray &attrs) override
  Associate key:value metadata with the study.

Private Member Functions
• void print_metadata (std::ostream &os, const MetaDataType &md) const
  print metadata to ostream
• void extract_data (const boost::any &dataholder, std::ostream &os) const
  determine the type of contained data and output it to ostream
• void output_data (const std::vector<double> &data, std::ostream &os) const
  output data to ostream
• void output_data (const std::vector<RealVector> &data, std::ostream &os) const
  output data to ostream
• void output_data (const std::vector<std::string> &data, std::ostream &os) const
  output data to ostream
• void output_data (const std::vector<std::vector<std::string>> &data, std::ostream &os) const
  output data to ostream
• void output_data (const RealMatrix &data, std::ostream &os) const
  output data to ostream

Private Attributes
• String fileName
  name of database file

Additional Inherited Members

13.191.1 Detailed Description

Class: ResultsDBAny
  Description: A map-based container to store DAKOTA Iterator results in underlying boost:anys, with optional metadata
13.191.2 Member Function Documentation

```cpp
void insert ( const StrStrSizet & iterator, const std::string & data_name, const boost::any & result, const MetaDataType & metadata ) [override], [virtual]
```

record addition with metadata map
- Add or update existing entry
- Implements ResultsDBBase.
- References ResultsDBBase::iteratorData, and Dakota::make_key().

```cpp
void extract_data ( const boost::any & dataholder, std::ostream & os ) const [private]
```

determine the type of contained data and output it to ostream
- Extract the data from the held any and map to supported concrete types int double RealVector (Teuchos::SerialDenseVector<int,double>) RealMatrix (Teuchos::SerialDenseMatrix<int,double>)
- References ResultsDBAny::output_data().
- Referenced by ResultsDBAny::flush().
- The documentation for this class was generated from the following files:
  - ResultsDBAny.hpp
  - ResultsDBAny.cpp

13.192 ResultsDBBase Class Reference

Inheritance diagram for ResultsDBBase:

![Inheritance Diagram](attachment:image)

**Public Member Functions**

- virtual void `flush () const`
  
  *If supported, flush data to the database or disk.*

- virtual void `allocate_vector (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &len, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())=0`
  
  *Pre-allocate a vector and (optionally) attach dimension scales and attributes. Insert elements using insert_into(...)*

- virtual void `allocate_matrix (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &num_rows, const int &num_cols, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())=0`
  
  *Pre-allocate a matrix and (optionally) attach dimension scales and attributes. Insert rows or columns using insert_into(...)*

- virtual void `insert (const StrStrSizet &iterator_id, const StringArray &location, const boost::any &data, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray(), const bool &transpose=false)=0`
addition with dimension scales and attributes

- virtual void insert_into (const StrStrSizet &iterator_id, const StringArray &location, const boost::any &data, const int &index, const bool &row)=0

  Insert a row or column into a pre-allocated matrix.

- virtual void add_metadata_to_method (const StrStrSizet &iterator_id, const AttributeArray &attrs)=0

  Add key:value metadata to a method.

- virtual void add_metadata_to_execution (const StrStrSizet &iterator_id, const AttributeArray &attrs)=0

  Add key:value metadata to an execution.

- virtual void add_metadata_to_object (const StrStrSizet &iterator_id, const StringArray &location, const AttributeArray &attrs)=0

  Associate key:value metadata with the object at the location.

- virtual void add_metadata_to_study (const AttributeArray &attrs)=0

  Associate key:value metadata to the study.

- template<typename StoredType >
  void array_allocate (const StrStrSizet &iterator_id, const std::string &data_name, size_t array_size, const MetaDataType &metadata)

  allocate an entry with sized array of the StoredType, e.g., array across response functions or optimization results sets

- template<typename StoredType >
  void array_insert (const StrStrSizet &iterator_id, const std::string &data_name, size_t index, const StoredType &sent_data)

  insert sent_data in specified position in previously allocated array

- virtual void insert (const StrStrSizet &iterator_id, const std::string &data_name, const boost::any &result, const MetaDataType &metadata)=0

  record addition with metadata map

Protected Attributes

- std::map< ResultsKeyType, ResultsValueType > iteratorData

  core data storage (map from key to value type)

13.192.1 Detailed Description

Class: ResultsDBBase
Description: A map-based container to store DAKOTA Iterator results in underlying boost::anys, with optional metadata

13.192.2 Member Function Documentation

void array_insert ( const StrStrSizet & iterator_id, const std::string & data_name, size_t index, const StoredType & sent_data )

insert sent_data in specified position in previously allocated array
insert requires previous allocation, and does not allow metadata update
References Dakota::abort_handler(), ResultsDBBase::iteratorData, and Dakota::make_key().
The documentation for this class was generated from the following file:

- ResultsDBBase.hpp
13.193 ResultsDBHDF5 Class Reference

Manage interactions between ResultsManager and the low-level HDFIOHelper class.

Inheritance diagram for ResultsDBHDF5:

```
ResultsDBBase
   |
   V
ResultsDBHDF5
```

Public Member Functions

- **ResultsDBHDF5** (bool in_core, std::shared_ptr<HDF5IOHelper> hdf5_helper_ptr)
- void **flush** () const

  *Flush HDF5 cache to disk.*

- void **allocate_vector** (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &len, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())

  *Pre-allocate a vector and (optionally) attach dimension scales and attributes. Insert elements using insert_into(...)*

- void **allocate_matrix** (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &num_rows, const int &num_cols, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())

  *Pre-allocate a matrix and (optionally) attach dimension scales and attributes. Insert rows or columns using insert_into(...)*

- void **insert_into** (const StrStrSizet &iterator_id, const StringArray &location, const boost::any &data, const int &index, const bool &row)

  *Insert a row or column into a pre-allocated matrix.*

- void **insert** (const StrStrSizet &iterator_id, const StringArray &location, const boost::any &data, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray(), const bool &transpose=false) override

  *Insert an arbitrary type (eg RealMatrix) with scales*

- void **add_metadata_to_method** (const StrStrSizet &iterator_id, const AttributeArray &attrs) override

  *Add attributes to the HDF5 method group.*

- void **add_metadata_to_execution** (const StrStrSizet &iterator_id, const AttributeArray &attrs) override

  *Add attributes to the HDF5 execution group.*

- void **add_metadata_to_object** (const StrStrSizet &iterator_id, const StringArray &location, const AttributeArray &attrs) override

  *Associate key:value metadata with the object at the location.*

- void **add_metadata_to_study** (const AttributeArray &attrs) override

  *Associate key:value metadata with the study.*

- void **insert** (const StrStrSizet &iterator_id, const std::string &data_name, const boost::any &result, const MetaDataType &metadata) override

  *record addition with metadata map*
CHAPTER 13. CLASS DOCUMENTATION

- template<typename StoredType>
  void array_allocate (const StrStrSizet &iterator_id, const std::string &data_name, size_t array_size, const MetaDataType &metadata)

  allocate an entry with sized array of the StoredType, e.g., array across response functions or optimization results

- template<typename StoredType>
  void array_insert (const StrStrSizet &iterator_id, const std::string &data_name, size_t index, const StoredType &stored_data)

Private Member Functions

- void attach_scales (const String &dset_name, const StrStrSizet &iterator_id, const StringArray &location, const DimScaleMap &scales)

  Attach a scale to a dataset.

- void add_attributes (const String &linkname, const AttributeArray &attrs)

  Add attributes to the object with linkname.

- void add_name_to_method (const StrStrSizet &iterator_id)

  Add the name (Dakota keyword) as metadata to a method group.

- bool method_in_cache (const StrStrSizet &iterator_id) const

  Check whether the name has already been added to a method group.

Private Attributes

- std::set<String> methodIdCache

  Cached method Ids; used to know which methods have already had their method_name attribute set. Hopefully
  faster than querying the HDF5 file.

- std::shared_ptr<HDF5IOHelper> hdf5Stream

  Instance of HDF5IOHelper (must be a pointer because it’s shared with the global evaluation store instance.

Static Private Attributes

- static const std::string outputVersion = "2.0.0"

  Version of the output file. See comments near the definition in ResultsDBHDF5.cpp.

Additional Inherited Members

13.193.1 Detailed Description

Manage interactions between ResultsManager and the low-level HDFIOHelper class.

The documentation for this class was generated from the following files:

- ResultsDBHDF5.hpp
- ResultsDBHDF5.cpp

13.194 ResultsEntry<StoredType> Class Template Reference

Class to manage in-core vs. file database lookups.
Public Member Functions

- **ResultsEntry** (const ResultsManager &results_mgr, const StrStrSizet &iterator_id, const std::string &data_name)
  
  *Construct ResultsEntry containing retrieved item of StoredType.*

- **ResultsEntry** (const ResultsManager &results_mgr, const StrStrSizet &iterator_id, const std::string &data_name, size_t array_index)
  
  *Construct ResultsEntry to retrieve item array_index from array of StoredType.*

Private Member Functions

- **ResultsEntry ()**
  
  *return a reference to the stored data, whether from core or file*

Private Attributes

- **bool coreActive**
  
  *whether the ResultsManager has an active in-core database*

- **StoredType dbData**
  
  *data retrieved from file data base*

- **const StoredType * dbDataPtr**
  
  *non-const pointer to const data we don’t own in the core case*

13.194.1 Detailed Description

template<
typename StoredType>
class Dakota::ResultsEntry< StoredType >

Class to manage in-core vs. file database lookups.

*ResultsEntry* manages database lookups. If a core database is available, will return a reference directly to the stored data; if disk, will return reference to a local copy contained in this class. Allows disk-stored data to persist for minimum time during lookup to support true out-of-core use cases.

13.194.2 Constructor & Destructor Documentation

*ResultsEntry ( ) [private]*

return a reference to the stored data, whether from core or file

default construction disallowed: data must be initialized from DB lookup if needed

The documentation for this class was generated from the following file:

- ResultsManager.hpp

13.195 ResultsFileError Class Reference

exception throw for other results file read error

Inheritance diagram for ResultsFileError:
CHAPTER 13. CLASS DOCUMENTATION

Public Member Functions

- **ResultsFileError** (const std::string &msg)

13.195.1 Detailed Description

Exception throw for other results file read error

The documentation for this class was generated from the following file:

- dakota_global_defs.hpp

13.196 ResultsManager Class Reference

Results manager for iterator final data.

Public Member Functions

- **ResultsManager** ()
  
  *default constructor: no databases active until they are added*

- **void clear_databases** ()
  
  *Delete all databases.*

- **void add_database** (std::unique_ptr< ResultsDBBase >)
  
  *Add a database.*

- **bool active** () const
  
  *whether any databases are active*

- **void flush** () const
  
  *Flush data to the database or disk, if supported.*

- **void close** ()
  
  *Close the database, if supported. This removes it from the active list of databases.*

- **template<typename StoredType>**
  
  void insert (const StrStrSizet &iterator_id, const StringArray &location, const StoredType &sent_data, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray(), const bool &transpose=false) const

  *Insert using dimension scales and attributes (DimScaleMap and AttributeArray in dakota_results_types.hpp)*

- **void allocate_matrix** (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &num_rows, const int &num_cols, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())

• **void allocate_vector** (const StrStrSizet &iterator_id, const StringArray &location, ResultsOutputType stored_type, const int &len, const DimScaleMap &scales=DimScaleMap(), const AttributeArray &attrs=AttributeArray())

  *Pre-allocate a vector and (optionally) attach dimension scales and attributes. Insert elements insert_into(....)*

• **template<typename StoredType > void insert_into** (const StrStrSizet &iterator_id, const StringArray &location, const StoredType &data, const int &index, const bool &row=true) const

  *Insert a row or column into a matrix that was pre-allocated using allocate_matrix.*

• **void add_metadata_to_method** (const StrStrSizet &iterator_id, const AttributeArray &attrs)

  *Associate key:value metadata with all the results and executions of a method.*

• **void add_metadata_to_execution** (const StrStrSizet &iterator_id, const AttributeArray &attrs)

  *Associate key:value metadata with all the results for this execution of a method.*

• **void add_metadata_to_object** (const StrStrSizet &iterator_id, const StringArray &location, const AttributeArray &attrs)

  *Associate key:value metadata with the object at the location.*

• **void add_metadata_to_study** (const AttributeArray &attrs)

  *Associate key:value metadata with the object at the location.*

• **template<typename StoredType > void array_allocate** (const StrStrSizet &iterator_id, const std::string &data_name, size_t array_size, const MetaDataType metadata=MetaDataType())

  *allocate an entry with array of StoredType of array_size for future insertion; likely move to non-templated accessors for these*

• **template<typename StoredType > void array_insert** (const StrStrSizet &iterator_id, const std::string &data_name, size_t index, const StoredType &sent_data)

  *insert into a previously allocated array of StoredType at index specified; metadata must be specified at allocation*

• **template<typename StoredType > void array_insert** (const StrStrSizet &iterator_id, const std::string &data_name, size_t index, StringMultiArrayConstView sent_data)

  *specialization: insert a SMACV into a previously allocated array of StringArrayStoredType at index specified; metadata must be specified at allocation*

• **template<typename StoredType > void insert** (const StrStrSizet &iterator_id, const std::string &data_name, const StoredType &sent_data, const MetaDataType metadata=MetaDataType())

  *insert data*

• **void insert** (const StrStrSizet &iterator_id, const std::string &data_name, StringMultiArrayConstView sma_labels, const MetaDataType metadata=MetaDataType())

**Public Attributes**

- **ResultsNames results_names**

  *Copy of valid results names for when manager is passed around.*

**Private Member Functions**

- **ResultsManager** (const ResultsManager &)

Private Attributes

- `std::vector<std::unique_ptr<ResultsDBBase>> resultsDBs`

Friends

- `template<typename StoredType>
class ResultsEntry

  ResultsEntry is a friend of ResultsManager.

13.196.1 Detailed Description

Results manager for iterator final data.

The results manager provides the API for posting and retrieving iterator results data (and eventually run config/statistics). It can manage a set of underlying results databases, in or out of core, depending on configuration.

The key for a results entry is documented in results_types.hpp, e.g., `tuple<std::string, std::string, size_t, std::string>`

For now, using concrete types for most insertion, since underlying databases like HDF5 might need concrete types; though template parameter for array allocation and retrieval.

All insertions overwrite any previous data.

The documentation for this class was generated from the following files:

- ResultsManager.hpp
- ResultsManager.cpp

13.197 ResultsNames Class Reference

List of valid names for iterator results.

Public Member Functions

- `ResultsNames()`

  Default constructor.

Public Attributes

- `size_t namesVersion = 0`
- `std::string best_cv = "Best Continuous Variables"`
- `std::string best_div = "Best Discrete Integer Variables"`
- `std::string best_dsv = "Best Discrete std::string Variables"`
- `std::string bestDrv = "Best Discrete Real Variables"`
- `std::string best_fns = "Best Functions"`
- `std::string moments_std = "Moments: Standard"`
- `std::string moments_central = "Moments: Central"`
- `std::string moments_std_num = "Moments: Standard: Numerical"`
- `std::string moments_central_num = "Moments: Central: Numerical"`
- `std::string moments_std_exp = "Moments: Standard: Expansion"`
13.197.1 Detailed Description

List of valid names for iterator results.
All data in the ResultsNames class is public, basically just a struct
The documentation for this class was generated from the following file:

- ResultsManager.hpp

13.198 RichExtrapVerification Class Reference

Class for Richardson extrapolation for code and solution verification.
Inheritance diagram for RichExtrapVerification:

```
        Iterator
           |
           v
        Analyzer
           |
           v
        Verification
           |
        RichExtrapVerification
```
Public Member Functions

- RichExtrapVerification (ProblemDescDB &problem_db, Model &model)
  
  constructor
- ~RichExtrapVerification ()
  
  destructor
- void core_run ()
  
  core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
- void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  
  print the final iterator results

Private Member Functions

- void estimate_order ()
  
  perform a single estimation of convOrder using extrapolation()
- void converge_order ()
  
  iterate using extrapolation() until convOrder stabilizes
- void converge_qoi ()
  
  iterate using extrapolation() until QOIs stabilize
- void extrapolation (const RealVector &refine_triple, RealMatrix &qoi_triples)
  
  estimate convOrder from refinement and quantity of interest (QOI) triples
- void extrapolate_result (const RealVector &refine_triple, const RealMatrix &qoi_triples)
  
  predict the converged value based on the convergence rate and the value of Phi

Private Attributes

- unsigned short studyType
  
  internal code for extrapolation study type: SUBMETHOD_{CONVERGE_ORDER, CONVERGE_QOI, ESTIMATE.ORDER}
- size_t numFactors
  
  number of refinement factors defined from active state variables
- RealVector initialCVars
  
  initial reference values for refinement factors
- size_t factorIndex
  
  the index of the active factor
- Real refinementRate
  
  rate of mesh refinement (default = 2.)
- RealMatrix convOrder
  
  the orders of convergence of the QOIs (numFunctions by numFactors)
- RealMatrix extrapolQOI
  
  the extrapolated value of the QOI (numFunctions by numFactors)
- RealMatrix numErrorQOI
  
  the numerical uncertainty associated with level of refinement (numFunctions by numFactors)
- RealVector refinementRefPt
  
  This is a reference point reported for the converged extrapolQOI and numErrorQOI. It currently corresponds to the coarsest mesh in the final refinement triple.
Additional Inherited Members

13.198.1 Detailed Description

Class for Richardson extrapolation for code and solution verification.

The RichExtrapVerification class contains several algorithms for performing Richardson extrapolation.

13.198.2 Member Function Documentation

void core_run() [virtual]

core portion of run; implemented by all derived classes and may include pre/post steps in lieu of separate pre/post
Virtual run function for the iterator class hierarchy. All derived classes need to redefine it.
Reimplemented from Iterator.

References Dakota::abort_handler(), Model::continuous_variables(), RichExtrapVerification::converge_order(),
RichExtrapVerification::convQOI(), RichExtrapVerification::convOrder, RichExtrapVerification::estimate_order(),
RichExtrapVerification::extrapQOI, RichExtrapVerification::initialCVars, Iterator::iteratedModel, RichExtrapVerification-
::numErrorQOI, RichExtrapVerification::numFactors, Analyzer::numFunctions, Iterator::outputLevel, RichExtrap-
Verification::refinementRefPt, and RichExtrapVerification::studyType.

void print_results (std::ostream & s, short results_state = FINAL_RESULTS) [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation
summary printed in finalize_run().
Reimplemented from Verification.

References Model::continuous_variable_labels(), RichExtrapVerification::convOrder, Dakota::copy_data(), Rich-
ExtrapVerification::extrapQOI, Iterator::iteratedModel, RichExtrapVerification::numErrorQOI, Verification::print-
_results(), RichExtrapVerification::refinementRate, RichExtrapVerification::refinementRefPt, Model::response-
labels(), and Dakota::write_data().

void estimate_order() [private]

perform a single estimation of convOrder using extrapolation()

This algorithm executes a single refinement triple and returns convergence order estimates.

References RichExtrapVerification::extrapolate_result(), RichExtrapVerification::extrapolation(), RichExtrap-
Verification::extrapQOI, RichExtrapVerification::factorIndex, RichExtrapVerification::initialCVars, RichExtrap-
Verification::numErrorQOI, RichExtrapVerification::numFactors, Analyzer::numFunctions, RichExtrapVerification-
::refinementRate, and RichExtrapVerification::refinementRefPt.

Referenced by RichExtrapVerification::core_run().

void converge_order() [private]

iterate using extrapolation() until convOrder stabilizes

This algorithm continues to refine until the convergence order estimate converges.

References Iterator::convergenceTol, RichExtrapVerification::convOrder, Dakota::copy_data(), RichExtrap-
Verification::extrapolate_result(), RichExtrapVerification::extrapolation(), RichExtrapVerification::extrapQOI, Rich-
ExtrapVerification::factorIndex, RichExtrapVerification::initialCVars, Iterator::maxIterations, RichExtrapVerification-
::numErrorQOI, RichExtrapVerification::numFactors, Analyzer::numFunctions, Iterator::outputLevel, RichExtrap-
Verification::refinementRate, and RichExtrapVerification::refinementRefPt.

Referenced by RichExtrapVerification::core_run().
840  CHAPTER 13. CLASS DOCUMENTATION

void converge_qoi( ) [private]
iterate using extrapolation() until QOIs stabilize
This algorithm continues to refine until the discretization error lies within a prescribed tolerance.
References Iterator::convergenceTol, RichExtrapVerification::extrapolate_result(), RichExtrapVerification::extrapolation(), RichExtrapVerification::extrapQOI, RichExtrapVerification::factorIndex, RichExtrapVerification::initialCVars, Iterator::maxIterations, RichExtrapVerification::numErrorQOI, RichExtrapVerification::numFactors, Analyzer::numFunctions, Iterator::outputLevel, RichExtrapVerification::refinementRate, RichExtrapVerification::refinementRefPt, and Dakota::write_data().
Referenced by RichExtrapVerification::core_run().
The documentation for this class was generated from the following files:
- RichExtrapVerification.hpp
- RichExtrapVerification.cpp

13.199  ROLOptimizer Class Reference

Inheritance diagram for ROLOptimizer:

Public Member Functions

- ROLOptimizer (ProblemDescDB &problem_db, Model &model)
  Standard constructor.
- ROLOptimizer (const String &method_name, Model &model)
  Alternate constructor for Iterator instantiations by name.
- ~ROLOptimizer ()
  Destructor.
- void initialize_run () override
  Initializes the ROLOptimizer with values available after the chain of constructors has finished.
- void core_run () override
  Iterates the ROL solver to determine the optimal solution.
- void reset_solver_options (const Teuchos::ParameterList &)
  Support resetting ROL solver options.
- ROL::OptimizationProblem< Real > & get_problem ()
  Accessor for the underlying ROL Problem.
Protected Member Functions

- void set_problem ()
  
  Helper function called during construction to extract problem information from the Model and set it for ROL.

- void set_rol_parameters ()
  
  Convenience function to map Dakota input and power-user parameters to ROL.

Protected Attributes

- Teuchos::ParameterList optSolverParams
  Parameters for the ROL::OptimizationSolver.

- unsigned short problemType
  ROL problem type.

- Teuchos::RCP<std::vector<Real>> rolX
  Handle to ROL's solution vector.

- Teuchos::RCP<ROL::StdVector<Real>> lowerBounds
  Handle to ROL's lower bounds vector.

- Teuchos::RCP<ROL::StdVector<Real>> upperBounds
  Handle to ROL's upper bounds vector.

- ROL::OptimizationProblem<Real> optProblem
  Handle to ROL::OptimizationProblem, part of ROL's simplified interface.

Additional Inherited Members

13.199.1 Detailed Description

ROLOptimizer specializes DakotaOptimizer to construct and run a ROL solver appropriate for the type of problem specified by the user.

13.199.2 Constructor & Destructor Documentation

ROLOptimizer ( ProblemDescDB & problem_db, Model & model )

Standard constructor.
  Implementation of ROLOptimizer class.
  References ROLOptimizer::set_problem(), and ROLOptimizer::set_rol_parameters().
  The documentation for this class was generated from the following files:

- ROLOptimizer.hpp
- ROLOptimizer.cpp
13.200 ROLTraits Class Reference

Inheritance diagram for ROLTraits:

```
TraitsBase
ROLTraits
```

Public Types
- `typedef std::vector<Real> VecT`
  
  *ROL default data type to be used by Dakota data adapters.*

Public Member Functions
- `ROLTraits()`  
  *Default constructor.*
- `virtual ~ROLTraits()`  
  *Destructor.*
- `bool supports_continuous_variables()`  
  *Return flag indicating ROL supports continuous variables.*
- `bool supports_linear_inequality()`  
  *Return flag indicating ROL supports linear inequalities.*
- `bool supports_nonlinear_inequality()`  
  *Return flag indicating ROL supports nonlinear inequalities.*
- `NONLINEAR_EQUALITY_FORMAT nonlinear_equality_format()`  
  *Return ROL format for nonlinear equality constraints.*
- `bool supports_nonlinear_inequality()`  
  *Return flag indicating ROL supports nonlinear inequalities.*
- `NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format()`  
  *Return ROL format for nonlinear inequality constraints.*

13.200.1 Detailed Description

**ROLTraits** defines the types of problems and data formats ROL supports by overriding the default traits accessors in TraitsBase.

The documentation for this class was generated from the following file:

- ROLOptimizer.hpp
13.201 ScalingModel Class Reference

Scaling specialization of RecastModel.

Inheritance diagram for ScalingModel:

```
Model
    RecastModel
        ScalingModel
```

Public Member Functions

- `ScalingModel (Model &sub_model)`
  standard constructor
- `~ScalingModel ()`
  destructor
- `RealVector cv_scaled2native (const RealVector &scaled_cv) const`

Public members for help in final results recovery

- `void resp_scaled2native (const Variables &native_vars, Response &updated_resp) const`
  map responses from scaled to native space, updating provided Response in-place (on entry it's scaled response, on exit it's native)
- `void secondary_resp_scaled2native (const RealVector &scaled_nln_cons, const ShortArray &asv, RealVector &native_fns) const`
  Use scaled nonlinear constraints (sized total functions) to update the nonlinear constraints portion of the passed native_fns array.
- `void response_modify_s2n (const Variables &native_vars, const Response &scaled_response, Response &native_response, int start_offset, int num_responses, bool response_unscale=true) const`
  map responses from scaled to native space
- `ActiveSet default_active_set ()`

Protected Member Functions

- `void initialize_scaling (Model &sub_model)`
  initialize scaling types, multipliers, and offsets; perform error checking
- `void compute_scaling (int object_type, int auto_type, int num_vars, RealVector &lbs, RealVector &ubs, RealVector &targets, const StringArray &scale_strings, const RealVector &scales, IntArray &scale_types, RealVector &scale_mults, RealVector &scale_offsets)`
  general helper function for initializing scaling types and factors on a vector of variables, functions, constraints, etc.
- `RealMatrix lin_coeffs_modify_n2s (const RealMatrix &native_coeffs, const RealVector &cv_multipliers, const RealVector &lin_multipliers) const`
  general linear coefficients mapping from native to scaled space
• bool compute_scale_factor (const Real lower_bound, const Real upper_bound, Real *multiplier, Real *offset)
  automatically compute a single scaling factor – bounds case
• bool compute_scale_factor (const Real target, Real *multiplier)
  automatically compute a single scaling factor – target case
• void print_scaling (const String &info, const IntArray &scale_types, const RealVector &scale_mults, const RealVector &scale_offsets, const StringArray &labels)
  print scaling information for a particular response type in tabular form
• bool need_resp_trans_byvars (const ShortArray &asv, int start_index, int num_resp) const
determine if response transformation is needed due to variable transformations
• RealVector modify_n2s (const RealVector &native_vars, const IntArray &scale_types, const RealVector &multipliers, const RealVector &offsets) const
general RealVector mapping from native to scaled variables vectors:
• RealVector modify_s2n (const RealVector &scaled_vars, const IntArray &scale_types, const RealVector &multipliers, const RealVector &offsets) const
general RealVector mapping from scaled to native variables (and values)
• void response_modify_n2s (const Variables &scaled_vars, const Response &native_response, Response &scaled_response, int start_offset, int num_responses) const
  map responses from native to scaled variable space

Static Protected Member Functions

• static bool scaling_active (const StringArray &scale_types)
  check whether the passed scale strings include any active (!= none) scale types
• static void variables_scaler (const Variables &scaled_vars, Variables &native_vars)
  RecastModel callback for variables scaling: transform variables from scaled to native (user) space.
• static void variables_unscaler (const Variables &native_vars, Variables &scaled_vars)
  RecastModel callback for inverse variables scaling: transform variables from native (user) to scaled space.
• static void primary_resp_scaler (const Variables &native_vars, const Variables &scaled_vars, const Response &native_response, Response &iterator_response)
  RecastModel callback for primary response scaling: transform responses (grads, Hessians) from native (user) to scaled space.
• static void secondary_resp_scaler (const Variables &native_vars, const Variables &scaled_vars, const Response &native_response, Response &scaled_response)
  RecastModel callback for secondary response scaling: transform constraints (grads, Hessians) from native (user) to scaled space.

Protected Attributes

• bool varsScaleFlag
  flag for variables scaling
• bool primaryRespScaleFlag
  flag for primary response scaling
• bool secondaryRespScaleFlag
  flag for secondary response scaling
• IntArray cvScaleTypes
scale flags for continuous vars.

- RealVector cvScaleMultipliers
  scales for continuous variables
- RealVector cvScaleOffsets
  offsets for continuous variables
- IntArray responseScaleTypes
  scale flags for all responses
- RealVector responseScaleMultipliers
  scales for all responses
- RealVector responseScaleOffsets
  offsets for all responses (zero < for functions, not for nonlin con)
- IntArray linearIneqScaleTypes
  scale flags for linear ineq
- RealVector linearIneqScaleMultipliers
  scales for linear ineq constrs.
- RealVector linearIneqScaleOffsets
  offsets for linear ineq constrs.
- IntArray linearEqScaleTypes
  scale flags for linear eq.
- RealVector linearEqScaleMultipliers
  scales for linear constraints
- RealVector linearEqScaleOffsets
  offsets for linear constraints

Static Protected Attributes

- static ScalingModel * scaleModelInstance
  static pointer to this class for use in static callbacks

Additional Inherited Members

13.201.1 Detailed Description

Scaling specialization of RecastModel.

Specialization of RecastModel to scale Variables and/or Responses This class provides a simple constructor that forwards to the more complicated RecastModel API

13.201.2 Constructor & Destructor Documentation

ScalingModel ( Model & sub_model )

standard constructor

This constructor computes various indices and mappings, then updates the properties of the RecastModel
CHAPTER 13. CLASS DOCUMENTATION

References Model::cv(), ScalingModel::cvScaleTypes, Model::div(), Model::drv(), Model::dsv(), RecastModel::init_maps(), ScalingModel:initialize_scaling(), RecastModel::inverse_mappings(), Model::modelId, Model::num_primary_fns(), Model::num_secondary_fns(), Model::outputLevel, ScalingModel::primary_resp_scaler(), Model::primary_response_fn_sense(), Model::primary_response_fn_weights(), ScalingModel::primaryRespScaleFlag, RecastModel::recast_model_id(), ScalingModel::responseScaleTypes, RecastModel::root_model_id(), ScalingModel::scaleModelInstance, ScalingModel::secondary_resp_scaler(), ScalingModel::secondaryRespScaleFlag, ScalingModel::variables_scaler(), ScalingModel::variables_unscaler(), and ScalingModel::varsScaleFlag.

13.201.3 Member Function Documentation

RealVector cv_scaled2native ( const RealVector & scaled_cv ) const

Public members for help in final results recovery

recover native variable values from the scaled space

Since this convenience function is public, it must have a fall-through to return a copy for when this scaling type isn’t active.

References ScalingModel::cvScaleMultipliers, ScalingModel::cvScaleOffsets, ScalingModel::cvScaleTypes, ScalingModel::modify_s2n(), and ScalingModel::varsScaleFlag.

Referenced by LeastSq::post_run(), and Optimizer::post_run().

void resp_scaled2native ( const Variables & native_vars, Response & updated_resp ) const

map responses from scaled to native space, updating provided Response in-place (on entry it’s scaled response, on exit it’s native)

Since this convenience function is public, it must behave correctly when this scale type isn’t active. It does, because it modifies in-place

References Response::active_set_request_vector(), Response::copy(), ScalingModel::need_resp_trans_byvars(), Model::num_nonlinear_eq_constraints(), Model::num_nonlinear_ineq_constraints(), Model::num_primary_fns(), ScalingModel::primaryRespScaleFlag, ScalingModel::response_modify_s2n(), ScalingModel::secondaryRespScaleFlag, and Response::update_partial().

Referenced by Optimizer::post_run().

void secondary_resp_scaled2native ( const RealVector & scaled_nln_cons, const ShortArray & asv, RealVector & native_fns ) const

Use scaled nonlinear constraints (sized total functions) to update the nonlinear constraints portion of the passed native_fns array.

Since this convenience function is public, it must have a fall-through to return a copy for when this scaling type isn’t active.

References Dakota::copy_data_partial(), ScalingModel::modify_s2n(), ScalingModel::need_resp_trans_byvars(), Model::num_nonlinear_eq_constraints(), Model::num_nonlinear_ineq_constraints(), Model::num_primary_fns(), ScalingModel::responseScaleMultipliers, ScalingModel::responseScaleOffsets, ScalingModel::responseScaleTypes, and ScalingModel::secondaryRespScaleFlag.

void response_modify_s2n ( const Variables & native_vars, const Response & scaled_response, Response & native_response, int start_offset, int num_responses, bool unscaleResp = true ) const

map responses from scaled to native space
Unscaling response mapping: modifies response from scaled (iterator) to native (user) space. Maps num_ responses starting at response_offset. If response_unscale = false, only variables will be unscaled, and responses left in scaled space.

References Response::active_set(), Variables::all_continuous_variable_ids(), Variables::all_continuous_variables(), Variables::continuous_variable_ids(), Variables::continuous_variables(), Dakota::copy_data(), Variables::cv(), ScalingModel::cvScaleMultipliers, ScalingModel::cvScaleOffsets, ScalingModel::cvScaleTypes, ActiveSet::derivative_vector(), Dakota::find_index(), Response::function_gradient_view(), Response::function_gradients(), Response::function_hessian_view(), Response::function_hessians(), Response::function_label(), Response::function_values(), Variables::icv(), Variables::inactive_continuous_variable_ids(), Variables::inactive_continuous_variables(), Model::num_primary_fns(), Model::outputLevel, ActiveSet::request_vector(), ScalingModel::responseScaleMultipliers, ScalingModel::responseScaleOffsets, ScalingModel::responseScaleTypes, Dakota::write_col_vector_trans(), Dakota::write_data(), and Dakota::write_precision.

Referenced by LeastSq::get_confidence_intervals(), and ScalingModel::resp_scaled2native().

```cpp
void initialize_scaling ( Model & sub_model ) [protected]
initialize scaling types, multipliers, and offsets; perform error checking

Initialize scaling types, multipliers, and offsets. Update the iteratedModel appropriately

References Dakota::abort_handler(), ScalingModel::compute_scaling(), Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::continuous_variable_labels(), Model::continuous_variables(), Dakota::copy_data(), Model::cv(), ScalingModel::cvScaleMultipliers, ScalingModel::cvScaleOffsets, ScalingModel::cvScaleTypes, ScalingModel::lin_coeffs_modify_n2s(), Model::linear_eq_constraint_coeffs(), Model::linear_eq_constraint_targets(), Model::linear_ineq_constraint_coeffs(), Model::linear_ineq_constraint_lower_bounds(), Model::linear_ineq_constraint_upper_bounds(), ScalingModel::linearEqScaleMultipliers, ScalingModel::linearEqScaleOffsets, ScalingModel::linearEqScaleTypes, ScalingModel::linearIneqScaleMultipliers, ScalingModel::linearIneqScaleOffsets, ScalingModel::linearIneqScaleTypes, ScalingModel::modify_n2s(), Model::nonlinear_eq_constraint_targets(), Model::nonlinear_ineq_constraint_lower_bounds(), Model::nonlinear_ineq_constraint_upper_bounds(), Model::num_linear_eq_constraints(), Model::num_linear_ineq_constraints(), Model::num_nonlinear_eq_constraints(), Model::num_nonlinear_ineq_constraints(), Model::num_fns(), Model::outputLevel, ScalingModel::primaryRespScaleFlag, ScalingModel::primaryRespScaleFlag, Model::response_labels(), ScalingModel::responseScaleMultipliers, ScalingModel::responseScaleOffsets, ScalingModel::responseScaleTypes, ScalingModel::scaling_active(), Model::scalingOpts, ScalingModel::secondaryRespScaleFlag, Model::supports_derivative_estimation(), Model::supportsEstimDerivs, and ScalingModel::varsScaleFlag.

Referenced by ScalingModel::ScalingModel().
```

```cpp
RealMatrix lin_coeffs_modify_n2s ( const RealMatrix & src_coeffs, const RealVector & cv_multipliers, const RealVector & lin_multipliers ) const [protected]
general linear coefficients mapping from native to scaled space

compute scaled linear constraint matrix given design variable multipliers and linear scaling multipliers. Only scales components corresponding to continuous variables so for src_coeffs of size MxN, lin_multipliers.size() <= M, cv_multipliers.size() <= N

Referenced by ScalingModel::initialize_scaling().
```

```cpp
void variables_scaler ( const Variables & scaled_vars, Variables & native_vars ) [static], [protected]
RecastModel callback for variables scaling: transform variables from scaled to native (user) space.

Variables map from iterator/scaled space to user/native space using a RecastModel.
```
References Variables::continuous_variable_labels(), Variables::continuous_variables(), ScalingModel::cvScale-Multipliers, ScalingModel::cvScaleOffsets, ScalingModel::cvScaleTypes, ScalingModel::modify_s2n(), Model::outputLevel, ScalingModel::scaleModelInstance, and Dakota::write_data().

Referenced by ScalingModel::ScalingModel().

```cpp
void secondary_resp_scaler ( const Variables & native_vars, const Variables & scaled_vars, const Response & native_response, Response & iterator_response ) [static], [protected]
```

RecastModel callback for secondary response scaling: transform constraints (grads, Hessians) from native (user) to scaled space.

Constraint function map from user/native space to iterator/scaled/combined space using a RecastModel.

References Response::active_set_request_vector(), ScalingModel::need_resp_trans_byvars(), Model::num_nonlinear_eq_constraints(), Model::num_nonlinear_ineq_constraints(), Model::num_nonlinear_fns(), Model::outputLevel, ScalingModel::response_modify_n2s(), ScalingModel::scaleModelInstance, ScalingModel::secondaryRespScaleFlag, and Response::update_partial().

Referenced by ScalingModel::ScalingModel().

```cpp
bool need_resp_trans_byvars ( const ShortArray & asv, int start_index, int num.resp ) const
```

[protected]

determine if response transformation is needed due to variable transformations

Determine if variable transformations present and derivatives requested, which implies a response transformation is necessary

References ScalingModel::varsScaleFlag.

Referenced by ScalingModel::primary_resp_scaler(), ScalingModel::resp_scaled2native(), ScalingModel::secondary_resp_scaled2native(), and ScalingModel::secondary_resp_scaler().

```cpp
RealVector modify_n2s ( const RealVector & native_vars, const IntArray & scale_types, const RealVector & multipliers, const RealVector & offsets ) const [protected]
```

general RealVector mapping from native to scaled variables vectors:

general RealVector mapping from native to scaled variables; loosely, in greatest generality: scaled_var = log((native_var - offset) / multiplier)

Referenced by ScalingModel::initialize_scaling(), and ScalingModel::variables_unscaler().

```cpp
RealVector modify_s2n ( const RealVector & scaled_vars, const IntArray & scale_types, const RealVector & multipliers, const RealVector & offsets ) const [protected]
```

general RealVector mapping from scaled to native variables (and values)

general RealVector mapping from scaled to native variables and/or vals; loosely, in greatest generality: scaled_var = (LOG_BASE^scaled_var) * multiplier + offset

Referenced by ScalingModel::cv_scaled2native(), ScalingModel::secondary_resp_scaled2native(), and ScalingModel::variables_scaler().

```cpp
void response_modify_n2s ( const Variables & native_vars, const Response & native_response, Response & recast_response, int start_offset, int num.responses ) const [protected]
```

map responses from native to scaled variable space

Scaling response mapping: modifies response from a model (user/native) for use in iterators (scaled). Maps num_responses starting at response_offset
13.202. SCALINGOPTIONS CLASS REFERENCE

References Response::active_set(), Variables::acv(), Variables::all_continuous_variable_ids(), Variables::all_continuous_variables(), Variables::continuous_variable_ids(), Variables::continuous_variables(), Dakota::copy_data(), Variables::cv(), ScalingModel::cvScaleMultipliers, ScalingModel::cvScaleOffsets, ScalingModel::cvScaleTypes, ActiveSet::derivative_vector(), Dakota::find_index(), Response::function_gradient_view(), Response::function_gradients(), Response::function_hessian_view(), Response::function_hessians(), Response::function_labels(), Response::function_value(), Variables::ivc(), Variables::inactive_continuous_variable_ids(), Variables::inactive_continuous_variables(), Model::num_primary_fns(), Model::outputLevel, ActiveSet::request_vector(), ScalingModel::responseScaleMultipliers, ScalingModel::responseScaleOffsets, ScalingModel::responseScaleTypes, Dakota::write_col_vector_trans(), Dakota::write_data(), and Dakota::write_precision.

Referenced by ScalingModel::primary_resp_scaler(), and ScalingModel::secondary_resp_scaler().

13.201.4 Member Data Documentation

**ScalingModel** * scaleModelInstance [static], [protected]

static pointer to this class for use in static callbacks

initialization of static needed by **RecastModel**

Referenced by ScalingModel::primary_resp_scaler(), ScalingModel::ScalingModel(), ScalingModel::secondary_resp_scaler(), ScalingModel::variables_scaler(), and ScalingModel::variables_unscaler().

The documentation for this class was generated from the following files:

- ScalingModel.hpp
- ScalingModel.cpp

13.202 ScalingOptions Class Reference

Simple container for user-provided scaling data, possibly expanded by replicates through the models.

Public Member Functions

- **ScalingOptions**()
  
  *default ctor: no scaling specified*

13.204. **SENSANALYSISGLOBAL CLASS REFERENCE**

### 13.203.1 Detailed Description

Specialization of `DirectApplicInterface` to link to Scilab analysis drivers. Includes convenience functions to map data to/from Scilab.

The documentation for this class was generated from the following files:

- ScilabInterface.hpp
- ScilabInterface.cpp

### 13.204 SensAnalysisGlobal Class Reference

Class for a utility class containing correlation calculations and variance-based decomposition.

#### Public Member Functions

- **SensAnalysisGlobal ()**  
  constructor
- **~SensAnalysisGlobal ()**  
  destructor
- void **compute_correlations** (const VariablesArray &vars_samples, const IntResponseMap &resp_samples, const StringSetArray &dss_vals)
  computes four correlation matrices for input and output data simple, partial, simple rank, and partial rank
- void **compute_correlations** (const RealMatrix &vars_samples, const IntResponseMap &resp_samples)
  computes four correlation matrices for input and output data simple, partial, simple rank, and partial rank
- void **archive_correlations** (const StrStrSizet &run_identifier, ResultsManager &iterator_results, StringMultiArrayConstView cv_labels, StringMultiArrayConstView div_labels, StringMultiArrayConstView dsv_labels, StringMultiArrayConstView drv_labels, const StringArray &resp_labels, const size_t &inc_id=0) const
  save correlations to database
- bool **correlations_computed** (const) const
  returns corrComputed to indicate whether `compute_correlations()` has been invoked
- void **print_correlations** (std::ostream &s, StringMultiArrayConstView cv_labels, StringMultiArrayConstView div_labels, StringMultiArrayConstView dsv_labels, StringMultiArrayConstView drv_labels, const StringArray &resp_labels) const
  prints the correlations computed in `compute_correlations()`

#### Private Member Functions

- size_t **find_valid_samples** (const IntResponseMap &resp_samples, BoolDeque &valid_sample)
  find samples with finite response (any sample with any Nan or +/-Inf observation will be dropped)
- void **valid_sample_matrix** (const VariablesArray &vars_samples, const IntResponseMap &resp_samples, const StringSetArray &dss_vals, const BoolDeque &is_valid_sample, RealMatrix &valid_data)
  extract a compact valid sample (vars/resp) matrix from the passed data
- void **valid_sample_matrix** (const RealMatrix &vars_samples, const IntResponseMap &resp_samples, const BoolDeque &is_valid_sample, RealMatrix &valid_samples)
  extract a compact valid sample (vars/resp) matrix from the passed data
- void **values_to_ranks** (RealMatrix &valid_data)
replace sample values with their ranks, in-place

- **void center_rows** (RealMatrix &data_matrix)
  center the passed matrix by its mean, in-place

- **void correl_adjust** (Real &corr_value)
  if result was NaN/Inf, preserve it, otherwise truncate to [-1.0, 1.0]

- **void simple_corr** (RealMatrix &total_data, const int &num_in, RealMatrix &corr_matrix)
  computes simple correlations, populating corr_matrix

- **void partial_corr** (RealMatrix &total_data, const int num_in, const RealMatrix &simple_corr_mat, RealMatrix &corr_matrix, bool &numerical_issues)
  computes partial correlations, populating corr_matrix and numerical_issues

- **bool has_nan_or_inf** (const RealMatrix &corr) const
  Return true if there are any NaN or Inf entries in the matrix.

**Static Private Member Functions**

- static bool rank_sort (const int &x, const int &y)
  sort algorithm to compute ranks for rank correlations

**Private Attributes**

- RealMatrix simpleCorr
  matrix to hold simple raw correlations

- RealMatrix simpleRankCorr
  matrix to hold simple rank correlations

- RealMatrix partialCorr
  matrix to hold partial raw correlations

- RealMatrix partialRankCorr
  matrix to hold partial rank correlations

- size_t numFns
  number of responses

- size_t numVars
  number of inputs

- bool numericalIssuesRaw
  flag indicating numerical issues in partial raw correlation calculations

- bool numericalIssuesRank
  flag indicating numerical issues in partial rank correlation calculations

- bool corrComputed
  flag indicating whether correlations have been computed

**Static Private Attributes**

- static RealArray raw_data = RealArray()
  array to hold temporary data before sort
13.204. **SENSANALYSISGLOBAL CLASS REFERENCE**

13.204.1 **Detailed Description**

Class for a utility class containing correlation calculations and variance-based decomposition.

This class provides code for several of the sampling methods both in the NonD branch and in the PStudyD-ACE branch. Currently, the utility functions provide global sensitivity analysis through correlation calculations (e.g. simple, partial, rank, raw) as well as variance-based decomposition.

13.204.2 **Member Function Documentation**

`void compute_correlations ( const VariablesArray & vars_samples, const IntResponseMap & resp_samples, const StringSetArray & dss_vals )`

computes four correlation matrices for input and output data simple, partial, simple rank, and partial rank

This version is used when full variables objects are being processed. Calculates simple correlation, partial correlation, simple rank correlation, and partial rank correlation coefficients.

References Dakota::abort_handler(), SensAnalysisGlobal::corrComputed, SensAnalysisGlobal::find_valid_samples(), SensAnalysisGlobal::numericalIssuesRank, SensAnalysisGlobal::numericalIssuesRaw, SensAnalysisGlobal::numFns, SensAnalysisGlobal::numVars, SensAnalysisGlobal::partial_corr(), SensAnalysisGlobal::partialRankCorr, SensAnalysisGlobal::simple_corr(), SensAnalysisGlobal::simpleRankCorr, SensAnalysisGlobal::valid_sample_matrix(), and SensAnalysisGlobal::values_to_ranks().

Referenced by NonDSampling::compute_statistics(), ParamStudy::post_run(), FSUDesignCompExp::post_run(), and DDACEDesignCompExp::post_run().

`void compute_correlations ( const RealMatrix & vars_samples, const IntResponseMap & resp_samples )`

computes four correlation matrices for input and output data simple, partial, simple rank, and partial rank

This version is used when compact samples matrix is being processed. Calculates simple correlation, partial correlation, simple rank correlation, and partial rank correlation coefficients.

References Dakota::abort_handler(), SensAnalysisGlobal::corrComputed, SensAnalysisGlobal::find_valid_samples(), SensAnalysisGlobal::numericalIssuesRank, SensAnalysisGlobal::numericalIssuesRaw, SensAnalysisGlobal::numFns, SensAnalysisGlobal::numVars, SensAnalysisGlobal::partial_corr(), SensAnalysisGlobal::partialCorr, SensAnalysisGlobal::partialRankCorr, SensAnalysisGlobal::simple_corr(), SensAnalysisGlobal::simpleCorr, SensAnalysisGlobal::simpleRankCorr, SensAnalysisGlobal::validSampleMatrix(), and SensAnalysisGlobal::values_to_ranks().

`void values_to_ranks ( RealMatrix & valid_data ) [private]`

replace sample values with their ranks, in-place

When converting values to ranks, uses the average ranks of any tied values

Referenced by SensAnalysisGlobal::compute_correlations().

`void simple_corr ( RealMatrix & total_data, const int & num_in, RealMatrix & corr_matrix ) [private]`

computes simple correlations, populating corr_matrix

Calculates simple correlation coefficients from a matrix of data (oriented factors x observations):

- num_corr is number of rows of total data
- num_in indicates whether only pairs of correlations should be calculated between pairs of columns (num_in vs. num_corr-num_in); if num_in = num_corr, correlations are calculated between all columns

References SensAnalysisGlobal::center_rows(), and SensAnalysisGlobal::correl_adjust().

Referenced by SensAnalysisGlobal::compute_correlations().
void partial_corr ( RealMatrix & total_data, const int num_in, const RealMatrix & simple_corr_mat, RealMatrix & corr_matrix, bool & numerical_issues ) [private]

computes partial correlations, populating corr_matrix and numerical_issues

Calculates partial correlation coefficients between num_in inputs and numRows() - num_in outputs.
References Dakota::abort_handler(), SensAnalysisGlobal::center_rows(), SensAnalysisGlobal::correl_adjust(), Dakota::qr(), Dakota::qr_rsolve(), and Dakota::svd().
Referenced by SensAnalysisGlobal::compute_correlations().
The documentation for this class was generated from the following files:

- SensAnalysisGlobal.hpp
- SensAnalysisGlobal.cpp

13.205 SeqHybridMetaIterator Class Reference

Method for sequential hybrid iteration using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity.

Inheritance diagram for SeqHybridMetaIterator:

```
        Iterator
           |
       MetaIterator
           |
        SeqHybridMetaIterator
```

Public Member Functions

- **SeqHybridMetaIterator (ProblemDescDB &problem_db)**
  standard constructor
- **SeqHybridMetaIterator (ProblemDescDB &problem_db, Model &model)**
  alternate constructor
- **~SeqHybridMetaIterator ()**
  destructor

Protected Member Functions

- **void core_run ()**
  Performs the hybrid iteration by executing a sequence of iterators, using a similar sequence of models that may vary in fidelity.
- **void print_results (std::ostream &s, short results_state=FINAL_RESULTS)**
  print the final iterator results
- **void derived_init_communicators (ParLevLIter pl_iter)**
  derived class contributions to initializing the communicators associated with this Iterator instance
- **void derived_set_communicators (ParLevLIter pl_iter)**
  derived class contributions to setting the communicators associated with this Iterator instance
• **void derived_free_communicators** *(ParLevLIter pl_iter)*
  derived class contributions to freeing the communicators associated with this *Iterator* instance

• **IntIntPair estimate_partition_bounds ()**
  estimate the minimum and maximum partition sizes that can be utilized by this *Iterator*

• **const Variables & variables_results () const**
  return the final solution from selectedIterators *(variables)*

• **const Response & response_results () const**
  return the final solution from selectedIterators *(response)*

• **void initialize_iterator (int job_index)**
  used by *IteratorScheduler* to set the starting data for a run

• **void pack_parameters_buffer (MPIPackBuffer &send_buffer, int job_index)**
  used by *IteratorScheduler* to pack starting data for an iterator run

• **void unpack_parameters_initialize (MPIUnpackBuffer &recv_buffer, int job_index)**
  used by *IteratorScheduler* to unpack starting data and initialize an iterator run

• **void pack_results_buffer (MPIPackBuffer &send_buffer, int job_index)**
  used by *IteratorScheduler* to pack results data from an iterator run

• **void unpack_results_buffer (MPIUnpackBuffer &recv_buffer, int job_index)**
  used by *IteratorScheduler* to unpack results data from an iterator run

• **void update_local_results (int job_index)**
  used by *IteratorScheduler* to update local results arrays

• **void declare_sources ()**
  Declare sources to the evaluations database.

### Private Member Functions

• **void run_sequential ()**
  run a sequential hybrid

• **void run_sequential_adaptive ()**
  run a sequential adaptive hybrid

• **void partition_sets (size_t num_sets, int job_index, size_t &start_index, size_t &job_size)**
  convert num_sets and job_index into a start_index and job_size for extraction from parameterSets

• **void extract_parameter_sets (int job_index, VariablesArray &partial_param_sets)**
  extract partial_param_sets from parameterSets based on job_index

• **void update_local_results (PRPArray &prp_results, int job_id)**
  update the partial set of final results from the local iterator execution

• **void initialize_iterator (const VariablesArray &param_sets)**
  called by unpack_parameters_initialize(MPIUnpackBuffer) and initialize_iterator(int) to update the active *Model* and *Iterator*
CHAPTER 13. CLASS DOCUMENTATION

Private Attributes

- String seqHybridType
  empty (default) or "adaptive"
- StringArray methodStrings
  the list of method pointer or method name identifiers
- StringArray modelStrings
  the list of model pointer identifiers for method identification by name
- bool lightwtMethodCtor
  use of lightweight Iterator construction by name
- bool singlePassedModel
  use of constructor that enforces use of a single passed Model
- IteratorArray selectedIterators
  the set of iterators, one for each entry in methodStrings
- ModelArray selectedModels
  the set of models, one for each iterator (if not lightweight construction)
- size_t seqCount
  hybrid sequence counter: 0 to numIterators-1
- Real progressThreshold
  when the progress metric falls below this threshold, the sequential adaptive hybrid switches to the next method
- PRP2DArray prpResults
  2-D array of results corresponding to numIteratorJobs, one set of results per job (iterators may return multiple final solutions)
- VariablesArray parameterSets
  1-D array of variable starting points for the iterator jobs

Friends

- class IteratorScheduler
  protect scheduler callback functions from general access

Additional Inherited Members

13.205.1 Detailed Description

Method for sequential hybrid iteration using multiple optimization and nonlinear least squares methods on multiple models of varying fidelity.

Sequential hybrid meta-iteration supports two approaches: (1) the non-adaptive sequential hybrid runs one method to completion, passes its best results as the starting point for a subsequent method, and continues this succession until all methods have been executed (the stopping rules are controlled internally by each iterator), and (2) the adaptive sequential hybrid uses adaptive stopping rules for the iterators that are controlled externally by this method. Any iterator may be used so long as it defines the notion of a final solution which can be passed as starting data for subsequent iterators.
void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]

print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().

Reimplemented from Iterator.

References Response::function_values(), Response::is_null(), Variables::is_null(), MetaIterator::iterSched, IteratorScheduler::messagePass, and SeqHybridMetaIterator::prpResults.

void run_sequential() [private]
run a sequential hybrid

In the sequential nonadaptive case, there is no interference with the iterators. Each runs until its own convergence criteria is satisfied. Status: fully operational.

References Iterator::accepts_multiple_points(), ParallelLibrary::bcast(), ParallelLibrary::bcast_hs(), Iterator::initialize_graphics(), Model::interface_id(), Iterator::iteratedModel, IteratorScheduler::iterator_message_lengths(), IteratorScheduler::iteratorCommRank, IteratorScheduler::iteratorCommSize, IteratorScheduler::iteratorScheduling, IteratorScheduler::iteratorServerId, MetaIterator::iterSched, IteratorScheduler::messagePass, Iterator::methodP_Clter, SeqHybridMetaIterator::methodStrings, IteratorScheduler::mpiIndex, Iterator::num_final_solutions(), Iterator::numFinalSolutions(), Iterator::numIteratorJobs, Iterator::numIteratorServers, SeqHybridMetaIterator::pack_parameters_buffer(), Iterator::parallelLib, SeqHybridMetaIterator::parameterSets, SeqHybridMetaIterator::prpResults, ParallelLibrary::recv(), Iterator::response_results(), IteratorScheduler::schedule_iterators(), SeqHybridMetaIterator::selectedIterators, SeqHybridMetaIterator::selectedModels, ParallelLibrary::send(), SeqHybridMetaIterator::seqCount, SeqHybridMetaIterator::singlePassedModel, MPIPackBuffer::size(), Iterator::summaryOutputFlag, and Iterator::variables_results().

Referenced by SeqHybridMetaIterator::core_run().

void run_sequential_adaptive() [private]

run a sequential adaptive hybrid

In the sequential adaptive case, there is interference with the iterators through the use of the ++ overloaded operator. iterator++ runs the iterator for one cycle, after which a progress metric is computed. This progress metric is used to dictate method switching instead of each iterator’s internal convergence criteria. Status: incomplete.

References Iterator::finalize_run(), Iterator::initialize_graphics(), Iterator::initialize_run(), IteratorScheduler::iteratorCommRank, IteratorScheduler::iteratorCommSize, MetaIterator::iterSched, SeqHybridMetaIterator::methodStrings, IteratorScheduler::mpiIndex, SeqHybridMetaIterator::numFinalSolutions(), SeqHybridMetaIterator::numIteratorServers, SeqHybridMetaIterator::progressThreshold, Iterator::response_results(), SeqHybridMetaIterator::selectedIterators, SeqHybridMetaIterator::selectedModels, SeqHybridMetaIterator::seqCount, Iterator::summaryOutputFlag, and Iterator::variables_results().

Referenced by SeqHybridMetaIterator::core_run().

void extract_parameter_sets ( int job_index, VariablesArray & partial_param_sets ) [inline], [private]

extract partial_param_sets from parameterSets based on job_index

This convenience function is executed on an iterator master (static scheduling) or a meta-iterator master (self scheduling) at run initialization time and has access to the full parameterSets array (this is All-Reduced for all peers at the completion of each cycle in run_sequential()).

References SeqHybridMetaIterator::parameterSets, and SeqHybridMetaIterator::partition_sets().
Referenced by SeqHybridMetaIterator::initialize_iterator(), and SeqHybridMetaIterator::pack_parameters_buffer(). The documentation for this class was generated from the following files:

- SeqHybridMetaIterator.hpp
- SeqHybridMetaIterator.cpp

### 13.206 SerialDirectApplicInterface Class Reference

Sample derived interface class for testing serial simulator plug-ins using `assign_rep()`.

Inheritance diagram for SerialDirectApplicInterface:

```
   Interface
     |
     |
     ApplicationInterface
     |
     |
     DirectApplicInterface
     |
     |
     SerialDirectApplicInterface
```

#### Public Member Functions

- `SerialDirectApplicInterface` (const Dakota::ProblemDescDB &problem_db)
  - constructor
- ∼`SerialDirectApplicInterface` ()
  - destructor

#### Protected Member Functions

- int `derived_map_ac` (const Dakota::String &ac_name)
  - execute an analysis code portion of a direct evaluation invocation
- void `derived_map_asynch` (const Dakota::ParamResponsePair &pair)
  - no-op hides base error; job batching occurs within `wait_local_evaluations()`
- void `wait_local_evaluations` (Dakota::PRPQueue &prp_queue)
  - evaluate the batch of jobs contained in prp_queue
- void `test_local_evaluations` (Dakota::PRPQueue &prp_queue)
  - invokes `wait_local_evaluations()` (no special nowait support)
- void `set_communicators_checks` (int max_eval_concurrency)
  - no-op hides default run-time error checks at DirectApplicInterface level

#### Private Member Functions

- int `rosenbrock` (const Dakota::RealVector &c_vars, short asv, Dakota::Real &fn_val, Dakota::RealVector &fn_grad, Dakota::RealSymMatrix &fn_hess)
  - Rosenbrock plug-in test function.
Additional Inherited Members

13.206.1 Detailed Description

Sample derived interface class for testing serial simulator plug-ins using assign_rep().

The plug-in SerialDirectApplicInterface resides in namespace SIM and uses a copy of rosenbrock() to perform serial parameter to response mappings. It is used to demonstrate plugging in a serial direct analysis driver into Dakota in library mode. Test input files can then use an analysis_driver of "plugin_rosenbrock".

13.206.2 Member Function Documentation

void test_local_evaluations ( Dakota::PRPQueue & prp_queue ) [inline], [protected]

invokes wait_local_evaluations() (no special nowait support)

For use by ApplicationInterface::serve_evaluations_asynch(), which can provide a batch processing capability within message passing schedulers (called using chain IteratorScheduler::run_iterator() \rightarrow Model::serve() \rightarrow ApplicationInterface::serve() \rightarrow ApplicationInterface::serve_evaluations() \rightarrow ApplicationInterface::serve_evaluations_asynch()).

References SerialDirectApplicInterface::wait_local_evaluations().

The documentation for this class was generated from the following files:

- PluginSerialDirectApplicInterface.hpp
- PluginSerialDirectApplicInterface.cpp

13.207 TrackerHTTP::Server Struct Reference

struct to hold tracker/proxy pairs

Public Member Functions

- Server (std::string t, std::string p)

Public Attributes

- std::string tracker
- std::string proxy

13.207.1 Detailed Description

struct to hold tracker/proxy pairs

The documentation for this struct was generated from the following file:

- TrackerHTTP.hpp

13.208 SharedApproxData Class Reference

Base class for the shared approximation data class hierarchy.

Inheritance diagram for SharedApproxData:
### Public Member Functions

- **SharedApproxData ()**  
  *default constructor*
- **SharedApproxData (ProblemDescDB &problem_db, size_t numVars)**  
  *standard constructor for envelope*
- **SharedApproxData (const String &approx_type, const UShortArray &approx_order, size_t num_vars, short data_order, short output_level)**  
  *alternate constructor for envelope*
- **SharedApproxData (const SharedApproxData &approx)**  
  *copy constructor*
- **virtual ~SharedApproxData ()**  
  *destructor*
- **SharedApproxData operator= (const SharedApproxData &approx)**  
  *assignment operator*
- **virtual void active_model_key (const UShortArray &mi_key)**  
  *activate an approximation state based on its multi-index key*
- **virtual const UShortArray & active_model_key () const**  
  *return active multi-index key*
- **virtual void clear_model_keys ()**  
  *reset initial state by clearing all model keys for an approximation*
- **virtual void link_multilevel_surrogate_data ()**  
  *define data keys and active data index for aggregated response data (SharedPecosApproxData)*
- **virtual void surrogate_model_key (const UShortArray &key)**  
  *update approxDataKeys[activeDataIndex] with trailing surrogate key*
- **virtual const UShortArray & surrogate_model_key () const**  
  *return trailing surrogate key from approxDataKeys[activeDataIndex]*
- **virtual void truth_model_key (const UShortArray &key)**  
  *update approxDataKeys[activeDataIndex] with leading truth key*
- **virtual const UShortArray & truth_model_key () const**  
  *return leading truth key from approxDataKeys[activeDataIndex]*
- **virtual void build ()**  
  *builds the shared approximation data from scratch*
- **virtual void rebuild ()**  
  *rebuilds the shared approximation data incrementally*
- **virtual void pop (bool save_surr_data)**  
  *back out the previous increment to the shared approximation data*
virtual bool push_available ()
    queries availability of pushing data associated with a trial set

virtual size_t push_index (const UShortArray &key)
    return index for restoring trial set within stored data sets

virtual void pre_push ()
    push a previous state of the shared approximation data

virtual void post_push ()
    clean up popped bookkeeping following push

virtual size_t finalize_index (size_t i, const UShortArray &key)
    return index of i-th trial set within restorable bookkeeping sets

virtual void pre_finalize ()
    finalize the shared approximation data following a set of increments

virtual void post_finalize ()
    clean up popped bookkeeping following aggregation

virtual void clear_inactive ()
    clear inactive approximation data

virtual void pre_combine ()
    aggregate the shared approximation data from current and stored states

virtual void post_combine ()
    clean up stored data sets after aggregation

virtual void combined_to_active (bool clear_combined=true)
    promote aggregated data sets to active state

void surrogate_data_index (size_t d_index)
    set activeDataIndex

void set_bounds (const RealVector &c_l_bnds, const RealVector &c_u_bnds, const IntVector &di_l_bnds,
    const IntVector &di_u_bnds, const RealVector &dr_l_bnds, const RealVector &dr_u_bnds)
    set approximation lower and upper bounds (currently only used by graphics)

SharedApproxData *data_rep () const
    returns dataRep for access to derived class member functions that are not mapped to the top SharedApproxData level

Protected Member Functions

SharedApproxData (BaseConstructor, ProblemDescDB &problem_db, size_t num-vars)
    constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

SharedApproxData (NoDBBaseConstructor, const String &approx_type, size_t num-vars, short data_order, short output_level)
    constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)
Protected Attributes

- `size_t numVars`
  number of variables in the approximation
- `String approxType`
  approximation type identifier
- `short buildDataOrder`
  order of the data used for surrogate construction, in ActiveSet request vector 3-bit format.
- `short outputLevel`
  output verbosity level: \{SILENT,QUIET,NORMAL,VERBOSE,DEBUG\} ,OUTPUT
- `size_t activeDataIndex`
  index of active approxData instance
- `UShort3DArray approxDataKeys`
  set of multi-index model keys (#surrData x #numKeys) to enumerate when updating SurrogateData instances within each Approximation
- `String modelExportPrefix`
  Prefix for model export files.
- `unsigned short modelExportFormat`
  Bitmapped format request for exported models.
- `RealVector approxCLowerBnds`
  approximation continuous lower bounds (used by 3D graphics and Surfpack KrigingModel)
- `RealVector approxCUpperBnds`
  approximation continuous upper bounds (used by 3D graphics and Surfpack KrigingModel)
- `IntVector approxDILowerBnds`
  approximation continuous lower bounds
- `IntVector approxDIUpperBnds`
  approximation continuous upper bounds
- `RealVector approxDRLowerBnds`
  approximation continuous lower bounds
- `RealVector approxDRUpperBnds`
  approximation continuous upper bounds

Private Member Functions

- `SharedApproxData * get_shared_data (ProblemDescDB &problem_db, size_t num_vars)`
  Used only by the standard envelope constructor to initialize dataRep to the appropriate derived type.
- `SharedApproxData * get_shared_data (const String &approx_type, const UShortArray &approx_order, size_t num_vars, short data_order, short output_level)`
  Used only by the alternate envelope constructor to initialize dataRep to the appropriate derived type.

Private Attributes

- `SharedApproxData * dataRep`
  pointer to the letter (initialized only for the envelope)
- `int referenceCount`
  number of objects sharing dataRep
13.208. SHAREDAPPROXDATA CLASS REFERENCE

Friends

- class SurfpackApproximation
- class PecosApproximation

13.208.1 Detailed Description

Base class for the shared approximation data class hierarchy.

The SharedApproxData class is the base class for the shared approximation data class hierarchy in DAKOTA. For memory efficiency and enhanced polymorphism, the approximation hierarchy employs the ”letter/envelope idiom” (see Coplien ”Advanced C++”, p. 133), for which the base class (SharedApproxData) serves as the envelope and one of the derived classes (selected in SharedApproxData::get_shared_data()) serves as the letter.

13.208.2 Constructor & Destructor Documentation

SharedApproxData ( )
default constructor
For the default constructor, dataRep is NULL. This makes it necessary to check for NULL in the copy constructor, assignment operator, and destructor.
Referenced by SharedApproxData::get_shared_data().

SharedApproxData ( ProblemDescDB & problem_db, size_t num_vars )
standard constructor for envelope
Envelope constructor only needs to extract enough data to properly execute get_shared_data, since SharedApproxData(BaseConstructor, problem_db) builds the actual base class data for the derived approximations.
References Dakota::abort_handler(), SharedApproxData::dataRep, and SharedApproxData::get_shared_data().

SharedApproxData ( const String & approx_type, const UShortArray & approx_order, size_t num_vars, short data_order, short output_level )
alternate constructor for envelope
This is the alternate envelope constructor for instantiations on the fly. Since it does not have access to problem_db, it utilizes the NoDBBaseConstructor constructor chain.
References Dakota::abort_handler(), SharedApproxData::dataRep, and SharedApproxData::get_shared_data().

SharedApproxData ( const SharedApproxData & shared_data )
copy constructor
Copy constructor manages sharing of dataRep and incrementing of referenceCount.
References SharedApproxData::dataRep, and SharedApproxData::referenceCount.
~SharedApproxData ( ) [virtual]
destructor
  Destructor decrements referenceCount and only deletes dataRep when referenceCount reaches zero.
  References SharedApproxData::dataRep, and SharedApproxData::referenceCount.

SharedApproxData ( BaseConstructor, ProblemDescDB & problem_db, size_t num_vars ) [protected]
constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion
in the derived class constructors - Coplien, p. 139)
  This constructor is the one which must build the base class data for all derived classes. get_shared_data()
instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization
list (to avoid recursion in the base class constructor calling get_shared_data() again). Since the letter IS the
representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~SharedApproxData).
  References SharedApproxData::approxDataKeys, SharedApproxData::approxType, SharedApproxData::build-
DataOrder, ProblemDescDB::get_bool(), ProblemDescDB::get_db_model_node(), ProblemDescDB::get_string(),
ProblemDescDB::set_db_model_nodes(), Dakota::strbegins(), and Dakota::strends().

SharedApproxData ( NoDBBaseConstructor, const String & approx_type, size_t num_vars, short
data_order, short output_level ) [protected]
constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion
in the derived class constructors - Coplien, p. 139)
  This constructor is the one which must build the base class data for all derived classes. get_shared_data()
instantiates a derived class letter and the derived constructor selects this base class constructor in its initialization
list (to avoid recursion in the base class constructor calling get_shared_data() again). Since the letter IS the
representation, its rep pointer is set to NULL (an uninitialized pointer causes problems in ~SharedApproxData).
  References SharedApproxData::approxDataKeys, SharedApproxData::approxType, SharedApproxData::build-
DataOrder, Dakota::strbegins(), and Dakota::strends().

13.208.3 Member Function Documentation

SharedApproxData operator= ( const SharedApproxData & shared_data )
assignment operator
  Assignment operator decrements referenceCount for old dataRep, assigns new dataRep, and increments reference-
Count for new dataRep.
  References SharedApproxData::dataRep, and SharedApproxData::referenceCount.

SharedApproxData * get_shared_data ( ProblemDescDB & problem_db, size_t num_vars ) [private]
Used only by the standard envelope constructor to initialize dataRep to the appropriate derived type.
  Used only by the standard envelope constructor to initialize dataRep to the appropriate derived type.
  References ProblemDescDB::get_string(), SharedApproxData::SharedApproxData(), and Dakota::strends().
  Referenced by SharedApproxData::SharedApproxData().

SharedApproxData * get_shared_data ( const String & approx_type, const UShortArray & approx_order,
size_t num_vars, short data_order, short output_level ) [private]
Used only by the alternate envelope constructor to initialize dataRep to the appropriate derived type.
Used only by the envelope constructor to initialize dataRep to the appropriate derived type. References SharedApproxData::SharedApproxData(), and Dakota::strends().

13.208.4 Member Data Documentation

short buildDataOrder [protected]

order of the data used for surrogate construction, in ActiveSet request vector 3-bit format.

This setting distinguishes derivative data intended for use in construction (includes derivatives w.r.t. the build variables) from derivative data that may be approximated separately (excludes derivatives w.r.t. auxiliary variables). This setting should also not be inferred directly from the responses specification, since we may need gradient support for evaluating gradients at a single point (e.g., the center of a trust region), but not require gradient evaluations at every point.

Referenced by SharedSurfpackApproxData::add_sd_to_surfdata(), TaylorApproximation::build(), TaylorApproximation::gradient(), TaylorApproximation::hessian(), TaylorApproximation::min_coefficients(), Approximation::min_points(), QMEApproximation::QMEApproximation(), Approximation::recommended_points(), SharedApproxData::SharedApproxData(), SharedPecosApproxData::SharedPecosApproxData(), SurfpackApproximation::SurfpackApproximation(), SurfpackApproximation::surrogates_to_surf_data(), TANA3Approximation::TANA3Approximation(), and TaylorApproximation::value().

13.209.1 Detailed Description

Derived approximation class for global basis polynomials.

The SharedPecosApproxData class provides a global approximation based on basis polynomials. This includes orthogonal polynomials used for polynomial chaos expansions and interpolation polynomials used for stochastic collocation.

13.209.2 Member Function Documentation

size_t push_index ( const UShortArray & key ) [inline], [protected], [virtual]

In Pecos, SharedPolyApproxData::push_index() is for internal use as it can be either a flattened (ISGDriver) or level-specific index (HSGDriver), as convenient for combined or hierarchical data restoration. SharedPolyApproxData::{restore,finalize}_index() are intended for external use and will map from push_index() to provide a consistent (flattened) representation. Dakota, however, does not make this distinction and uses {push,finalize}._index() semantics for consistency with {push,finalize}._data().

Reimplemented from SharedApproxData.

References SharedPecosApproxData::pecosSharedDataRep.

13.210 SharedResponseData Class Reference

Container class encapsulating variables data that can be shared among a set of Response instances.
Public Member Functions

- `SharedResponseData()`  
  default constructor
- `SharedResponseData(const ProblemDescDB &problem_db)`  
  standard constructor
- `SharedResponseData(const ActiveSet &set)`  
  alternate on-the-fly constructor (explicit disallows its use for implicit type conversion so that instantiations of Response(set) are invalid)
- `SharedResponseData(const SharedResponseData &srd)`  
  copy constructor
- `~SharedResponseData()`  
  destructor
- `SharedResponseData & operator=(const SharedResponseData &srd)`  
  assignment operator
- `bool operator==(const SharedResponseData &other)`  
  experimental operator== for use in unit testing
- `size_t num_scalar_responses() const`  
  number of scalar responses
- `size_t num_field_response_groups() const`  
  number of field response groups
- `size_t num_response_groups() const`  
  total number of response groups (scalars + field groups)
- `size_t num_field_functions() const`  
  total number of field functions (1-norm of fieldRespGroupLengths)
- `size_t num_functions() const`  
  total number of response functions (scalars + 1-norm of fieldRespGroupLengths)
- `const IntVector & field_lengths() const`  
  index of field lengths for field data
- `void field_lengths(const IntVector &field_lengths)`  
  set field lengths (if experiment different from simulation)
- `const IntVector & num_coords_per_field() const`  
  dimensions of each function
- `const String & function_label(size_t i) const`  
  return a response function identifier string
- `const StringArray & function_labels() const`  
  return the response function identifier strings
- `StringArray & function_labels()`  
  return the response function identifier strings
- `void function_label(const String &label, size_t i)`  
  set a response function identifier string
- `void function_labels(const StringArray &labels)`  
  set the response function identifier strings
- `const StringArray & field_group_labels()`
return the coarse (per-group) field response labels

- **void field_group_labels (const StringArray &field_labels)**
  set the coarse field group labels (must agree with number fields)

- **const String & responses_id () const**
  return the response identifier

- **short response_type () const**
  return the response type: \{BASE, SIMULATION, EXPERIMENT\}_RESPONSE

- **void response_type (short type)**
  set the response type: \{BASE, SIMULATION, EXPERIMENT\}_RESPONSE

- **short primary_fn_type () const**
  get the primary function type (generic, objective, calibration)

- **void primary_fn_type (short type)**
  set the primary function type (generic, objective, calibration)

- **const RealVector & simulation_error () const**
  retrieve simulation variance

- **SharedResponseData copy () const**
  create a deep copy of the current object and return by value

- **void reshape (size_t num_fns)**
  reshape the data, disconnecting a shared rep if necessary

- **void reshape_labels (StringArray &resp_labels, size_t num_fns)**
  reshape the response labels using inflation/deflation if possible

- **bool is_null () const**
  return true if empty handle with null representation

- **long reference_count () const**
  how many handles (including this) are sharing this representation (body); for debugging/testing only

- **template<class Archive>**
  **void serialize (Archive &ar, const unsigned int version)**
  serialize through the pointer, which requires object tracking; write and read are symmetric for this class

**Private Member Functions**

- **template<class Archive>**
  **void serialize (Archive &ar, const unsigned int version)**
  serialize through the pointer, which requires object tracking; write and read are symmetric for this class

**Private Attributes**

- **boost::shared_ptr<SharedResponseDataRep> srdRep**
  pointer to the body (handle-body idiom)

**Friends**

- **class boost::serialization::access**
  allow boost access to serialize this class
13.210.1 Detailed Description

Container class encapsulating variables data that can be shared among a set of Response instances.

An array of Response objects (e.g., Analyzer::allResponse) contains repeated configuration data (id’s, labels, counts). SharedResponseData employs a handle-body idiom to allow this shared data to be managed in a single object with many references to it, one per Response object in the array. This allows scaling to larger sample sets.

13.210.2 Member Function Documentation

SharedResponseData copy ( ) const
create a deep copy of the current object and return by value
Deep copies are used when recasting changes the nature of a Response set.
References SharedResponseData::srdRep.
Referenced by ExperimentData::initialize(), and ExperimentData::load_data().
The documentation for this class was generated from the following files:
• SharedResponseData.hpp
• SharedResponseData.cpp

13.211 SharedResponseDataRep Class Reference

The representation of a SharedResponseData instance. This representation, or body, may be shared by multiple SharedResponseData handle instances.

Public Member Functions

• ~SharedResponseDataRep ()
destructor must be public for shared_ptr
template <class Archive>
void serialize (Archive &ar, const unsigned int version)

Private Member Functions

• SharedResponseDataRep ()
default constructor
• SharedResponseDataRep (const ProblemDescDB &problem_db)
standard constructor
• SharedResponseDataRep (const ActiveSet &set)
alternate on-the-fly constructor
• void copy_rep (SharedResponseDataRep &srd_rep)
copy the data from srd_rep to the current representation
• template <class Archive>
void serialize (Archive &ar, const unsigned int version)
serialize the core shared response data: write and read are symmetric for this class
• bool operator==(const SharedResponseDataRep &other)
experimental operator== for use in unit testing
• void build_field_labels ()
build/update the unrolled field labels based on fieldLabels and group lengths
Private Attributes

- short responseType
  enumeration of BASE_RESPONSE, SIMULATION_RESPONSE, or EXPERIMENT_RESPONSE
- short primaryFnType
  data set type for primary response: generic, objective, calibration
- String responsesId
  response identifier string from the input file
- StringArray functionLabels
  fine-grained (unrolled) set of response function identifiers used to improve output readability; length Response-::functionValues
- StringArray fieldLabels
  labels for each field group
- RealVector simulationVariance
  simulation variance
- size_t numScalarResponses
  number of scalar responses
- IntVector fieldRespGroupLengths
  index of field lengths for field data
- IntVector numCoordsPerField
  dimensions of each function

Friends

- class SharedResponseData
- class boost::serialization::access
  allow boost access to serialize this class

13.211.1 Detailed Description

The representation of a SharedResponseData instance. This representation, or body, may be shared by multiple SharedResponseData handle instances.

The SharedResponseData/SharedResponseDataRep pairs utilize a handle-body idiom (Coplien, Advanced C++).

13.211.2 Member Function Documentation

void copy_rep ( SharedResponseDataRep * srd_rep ) [private]
copy the data from srd_rep to the current representation
  Deep copies are used when recasting changes the nature of a Response set.
References SharedResponseDataRep::fieldLabels, SharedResponseDataRep::fieldRespGroupLengths, SharedResponseDataRep::functionLabels, SharedResponseDataRep::numCoordsPerField, SharedResponseDataRep::numScalarResponses, SharedResponseDataRep::primaryFnType, SharedResponseDataRep::responsesId, SharedResponseDataRep::responseType, and SharedResponseDataRep::simulationVariance.

The documentation for this class was generated from the following files:

- SharedResponseData.hpp
- SharedResponseData.cpp
13.212 SharedSurfpackApproxData Class Reference

Derived approximation class for Surfpack approximation classes. Interface between Surfpack and Dakota.

Inheritance diagram for SharedSurfpackApproxData:

```
SharedApproxData
    SharedSurfpackApproxData
```

Public Member Functions

- `SharedSurfpackApproxData ()`
  default constructor
- `SharedSurfpackApproxData (const String &approx_type, const UShortArray &approx_order, size_t num_vars, short data_order, short output_level)`
  alternate constructor
- `SharedSurfpackApproxData (ProblemDescDB &problem_db, size_t num_vars)`
  standard constructor: Surfpack surface of appropriate type will be created
- `~SharedSurfpackApproxData ()`
  destructor

Private Member Functions

- `void add_sd_to_surfdata (const Pecos::SurrogateDataVars &sdv, const Pecos::SurrogateDataResp &sdr, short fail_code, SurfData &surf_data)`
  add Pecos::SurrogateData::SurrogateData{Vars,Resp} to SurfData, accounting for buildDataOrder available
- `void copy_matrix (const RealSymMatrix &rsm, SurfpackMatrix<Real> &surfpack_matrix)`
  copy RealSymMatrix to SurfpackMatrix (Real type only)
- `void merge_variable_arrays (const RealVector &cv, const IntVector &div, const RealVector &drv, RealArray &ra)`
  merge cv, div, and drv vectors into a single ra array
- `void sdv_to_realarray (const Pecos::SurrogateDataVars &sdv, RealArray &ra)`
  aggregate {continuous,discrete int,discrete real} variables from SurrogateDataVars into ra
- `void vars_to_realarray (const Variables &vars, RealArray &ra)`
  aggregate {active,all} {continuous,discrete int,discrete real} variables into ra

Private Attributes

- `unsigned short approxOrder`
  order of polynomial approximation
- `StringArray diagnosticSet`
  set of diagnostic metrics
- `bool crossValidateFlag`
whether to perform cross validation

- **unsigned numFolds**
  number of folds for CV
- **Real percentFold**
  percentage of data for CV
- **bool pressFlag**
  whether to perform PRESS

**Friends**

- **class SurfpackApproximation**
- **class VPSApproximation**

**Additional Inherited Members**

13.212.1 Detailed Description

Derived approximation class for Surfpack approximation classes. Interface between Surfpack and Dakota. The SharedSurfpackApproxData class is the interface between Dakota and Surfpack. Based on the information in the ProblemDescDB that is passed in through the constructor, SharedSurfpackApproxData builds a Surfpack Surface object that corresponds to one of the following data-fitting techniques: polynomial regression, kriging, artificial neural networks, radial basis function network, or multivariate adaptive regression splines (MARS).

13.212.2 Constructor & Destructor Documentation

**SharedSurfpackApproxData ( const String & approx_type, const UShortArray & approx_order, size_t num_vars, short data_order, short output_level )**

alternate constructor
On-the-fly constructor which uses mostly Surfpack model defaults.
References Dakota::abort_handler(), SharedSurfpackApproxData::approxOrder, and SharedApproxData::approxType.

**SharedSurfpackApproxData ( ProblemDescDB & problem_db, size_t num_vars )**

standard constructor: Surfpack surface of appropriate type will be created
Initialize the embedded Surfpack surface object and configure it using the specifications from the input file.
Data for the surface is created later.
References SharedSurfpackApproxData::approxOrder, SharedApproxData::approxType, ProblemDescDB::get_short(), and ProblemDescDB::get_string().
The documentation for this class was generated from the following files:
- SharedSurfpackApproxData.hpp
- SharedSurfpackApproxData.cpp

13.213 SharedVariablesData Class Reference

Container class encapsulating variables data that can be shared among a set of Variables instances.
Public Member Functions

- `SharedVariablesData ()`
  default constructor
- `SharedVariablesData (const ProblemDescDB &problem_db, const std::pair< short, short > &view)`
  standard constructor
- `SharedVariablesData (const std::pair< short, short > &view, const std::map< unsigned short, size_t > &vars_comps, const BitArray &all_relax_di=BitArray(), const BitArray &all_relax_dr=BitArray())`
  medium weight constructor providing detailed variable counts
- `SharedVariablesData (const std::pair< short, short > &view, const SizetArray &vars_comps_totals, const BitArray &all_relax_di=BitArray(), const BitArray &all_relax_dr=BitArray())`
  lightweight constructor providing variable count totals
- `SharedVariablesData (const SharedVariablesData &svd)`
  copy constructor
- `~SharedVariablesData ()`
  destructor
- `SharedVariablesData & operator=(const SharedVariablesData &svd)`
  assignment operator
- `SharedVariablesData copy () const`
  create a deep copy of the current object and return by value
- `void all_counts (size_t &num_acv, size_t &num_adiv, size_t &num_adsv, size_t &num_adrv) const`
  compute all variables sums from `SharedVariablesDataRep::variablesCompsTotals` and `SharedVariablesDataRep::allRelaxedDiscrete`{Int,Real}
- `void design_counts (size_t &num_cdv, size_t &num_ddiv, size_t &num_ddsv, size_t &num_ddrv) const`
  compute design variables sums from `SharedVariablesDataRep::variablesCompsTotals` and `SharedVariablesDataRep::allRelaxedDiscrete`{Int,Real}
- `void aleatory_uncertain_counts (size_t &num_cauv, size_t &num_dauiv, size_t &num_dausv, size_t &num_daurv) const`
  compute aleatory uncertain variables sums from `SharedVariablesDataRep::variablesCompsTotals` and `SharedVariablesDataRep::allRelaxedDiscrete`{Int,Real}
- `void epistemic_uncertain_counts (size_t &num_ceuv, size_t &num_deuiv, size_t &num_deusv, size_t &num_deurv) const`
  compute epistemic uncertain variables sums from `SharedVariablesDataRep::variablesCompsTotals` and `SharedVariablesDataRep::allRelaxedDiscrete`{Int,Real}
- `void uncertain_counts (size_t &num_cuv, size_t &num_duv, size_t &num_dusv, size_t &num_durv) const`
  compute uncertain variables sums from `SharedVariablesDataRep::variablesCompsTotals` and `SharedVariablesDataRep::allRelaxedDiscrete`{Int,Real}
- `void state_counts (size_t &num_csv, size_t &num_dsv, size_t &num_dssv, size_t &num_dsrv) const`
  compute state variables sums from `SharedVariablesDataRep::variablesCompsTotals` and `SharedVariablesDataRep::allRelaxedDiscrete`{Int,Real}
- `void initialize_active_start_counts ()`
  initialize start index and counts for active variables
- `void initialize_inactive_start_counts ()`
  initialize start index and counts for inactive variables
- `void initialize_active_components ()`
initialize the active components totals given active variable counts
• void initialize_inactive_components ()
  initialize the inactive components totals given inactive variable counts
• const BitArray & all_relaxed_discrete_int () const
  return allRelaxedDiscreteInt
• const BitArray & all_relaxed_discrete_real () const
  return allRelaxedDiscreteReal
• StringMultiArrayView all_continuous_labels (size_t start, size_t num_items) const
  get num_items continuous labels beginning at index start
• void all_continuous_labels (StringMultiArrayConstView cv_labels, size_t start, size_t num_items)
  set num_items continuous labels beginning at index start
• void all_continuous_label (const String &cv_label, size_t index)
  set continuous label at index start
• StringMultiArrayView all_discrete_int_labels (size_t start, size_t num_items) const
  get num_items discrete integer labels beginning at index start
• void all_discrete_int_labels (StringMultiArrayConstView div_labels, size_t start, size_t num_items)
  set num_items discrete integer labels beginning at index start
• void all_discrete_int_label (const String &div_label, size_t index)
  set discrete integer label at index start
• StringMultiArrayView all_discrete_string_labels (size_t start, size_t num_items) const
  get num_items discrete string labels beginning at index start
• void all_discrete_string_labels (StringMultiArrayConstView dsv_labels, size_t start, size_t num_items)
  set num_items discrete string labels beginning at index start
• void all_discrete_string_label (const String &dsv_label, size_t index)
  set discrete string label at index start
• StringMultiArrayView all_discrete_real_labels (size_t start, size_t num_items) const
  get num_items discrete real labels beginning at index start
• void all_discrete_real_labels (StringMultiArrayConstView drv_labels, size_t start, size_t num_items)
  set num_items discrete real labels beginning at index start
• void all_discrete_real_label (const String &drv_label, size_t index)
  set discrete real label at index start
• UShortMultiArrayConstView all_continuous_types (size_t start, size_t num_items) const
  get num_items continuous types beginning at index start
• void all_continuous_types (UShortMultiArrayConstView cv_types, size_t start, size_t num_items)
  set num_items continuous types beginning at index start
• void all_continuous_type (unsigned short cv_type, size_t index)
  set continuous type at index
• UShortMultiArrayConstView all_discrete_int_types (size_t start, size_t num_items) const
  get num_items discrete integer types beginning at index start
• void all_discrete_int_types (UShortMultiArrayConstView div_types, size_t start, size_t num_items)
  set num_items discrete integer types beginning at index start
• void all_discrete_int_type (unsigned short div_type, size_t index)
  set discrete integer type at index
• UShortMultiArrayConstView all_discrete_string_types (size_t start, size_t num_items) const
get num_items discrete string types beginning at index start
• void all_discrete_string_types (UShortMultiArrayConstView dsv_types, size_t start, size_t num_items)
set num_items discrete string types beginning at index start
• void all_discrete_string_type (unsigned short dsv_type, size_t index)
set discrete string type at index
• UShortMultiArrayConstView all_discrete_real_types (size_t start, size_t num_items) const
get num_items discrete real types beginning at index start
• void all_discrete_real_types (UShortMultiArrayConstView dsv_types, size_t start, size_t num_items)
set num_items discrete real types beginning at index start
• void all_discrete_real_type (unsigned short dsv_type, size_t index)
set discrete real type at index
• SizetMultiArrayConstView all_continuous_ids (size_t start, size_t num_items) const
get num_items continuous ids beginning at index start
• void all_continuous_ids (SizetMultiArrayConstView cv_ids, size_t start, size_t num_items)
set num_items continuous ids beginning at index start
• void all_continuous_id (size_t id, size_t index)
set num_items continuous ids beginning at index start
• SizetMultiArrayConstView all_discrete_int_ids (size_t start, size_t num_items) const
get num_items discrete int ids beginning at index start
• SizetMultiArrayConstView all_discrete_string_ids (size_t start, size_t num_items) const
get num_items discrete string ids beginning at index start
• SizetMultiArrayConstView all_discrete_real_ids (size_t start, size_t num_items) const
get num_items discrete real ids beginning at index start
• const String & id () const
return the user-provided or default Variables identifier
• const SizetArray & components_totals () const
return variable type counts for {continuous,discrete integer,discrete real} {design,aleatory uncertain,epistemic uncertain,state}
• const SizetArray & active_components_totals () const
return active variable type counts for {continuous,discrete integer,discrete real} {design,aleatory uncertain,epistemic uncertain,state}
• const SizetArray & inactive_components_totals () const
return inactive variable type counts for {continuous,discrete integer,discrete real} {design,aleatory uncertain,epistemic uncertain,state}
• size_t vc_lookup (unsigned short key) const
retrieve the variables type count within svdRep->variablesComponents corresponding to (a fine-grain variables type) key
• const std::pair< short, short > & view () const
retrieve the Variables view
• void inactive_view (short view2)
set the inactive Variables view
• size_t cv () const
get number of active continuous vars
- `size_t cv_start() const`  
  get start index of active continuous vars

- `size_t div() const`  
  get number of active discrete int vars

- `size_t div_start() const`  
  get start index of active discrete int vars

- `size_t dsv() const`  
  get number of active discrete string vars

- `size_t dsv_start() const`  
  get start index of active discrete string vars

- `size_t drv() const`  
  get number of active discrete real vars

- `size_t drv_start() const`  
  get start index of active discrete real vars

Private Member Functions

- template <class Archive>
  - void serialize (Archive &ar, const unsigned int version)
  - serialize through the pointer, which requires object tracking: write and read are symmetric for this class

Private Attributes

- boost::shared_ptr
  - < SharedVariablesDataRep > svdRep
  - pointer to the body (handle-body idiom)

Friends

- class boost::serialization::access
  - allow boost access to serialize this class

13.213.1 Detailed Description

Container class encapsulating variables data that can be shared among a set of Variables instances.

An array of Variables objects (e.g., Analyzer::allVariables) contains repeated configuration data (id’s, labels, counts). SharedVariablesData employs a handle-body idiom to allow this shared data to be managed in a single object with many references to it, one per Variables object in the array. This allows scaling to larger sample sets.
13.213.2 Member Function Documentation

`SharedVariablesData copy ( ) const`

create a deep copy of the current object and return by value
Deep copies are used when recasting changes the nature of a Variables set.
References Dakota::svd(), and SharedVariablesData::svdRep.
The documentation for this class was generated from the following files:

- `SharedVariablesData.hpp`
- `SharedVariablesData.cpp`

13.214 `SharedVariablesDataRep` Class Reference

The representation of a `SharedVariablesData` instance. This representation, or body, may be shared by multiple `SharedVariablesData` handle instances.

Public Member Functions

- `~SharedVariablesDataRep ( )`
  destructor must be public for shared_ptr
- `template<class Archive > void save (Archive &ar, const unsigned int version) const`
- `template<class Archive > void load (Archive &ar, const unsigned int version)`

Private Member Functions

- `SharedVariablesDataRep (const ProblemDescDB &problem_db, const std::pair< short, short > &view)`
  standard constructor
- `SharedVariablesDataRep (const std::pair< short, short > &view, const std::map< unsigned short, size_t > &vars_comps, const BitArray &all_relax_di, const BitArray &all_relax_dr)`
  medium weight constructor providing detailed variable counts
- `SharedVariablesDataRep (const std::pair< short, short > &view, const SizetArray &vars_comps_totals, const BitArray &all_relax_di, const BitArray &all_relax_dr)`
  lightweight constructor providing variable count totals
- `SharedVariablesDataRep ( )`
  default constructor
- `void initialize_components_totals (const ProblemDescDB &problem_db)`
  populate variables{Components,CompsTotal} from user variable type and count specifications
- `void components_to_totals ( )`
  update variablesCompsTotal from variablesComponents
- `void relax_noncategorical (const ProblemDescDB &problem_db)`
  populate allRelaxedDiscrete{Int,Real} from user specifications (relax variables that are not declared as categorical)
- `void set_relax (const BitArray &user_cat_spec, size_t ucs_index, size_t ard_cntr, BitArray &ard_container)`
  Set the ard_cntr entry in the all-relaxed-discrete integer or real container ard_container, based on user-specification of categorical, accounting for empty.
• **void all_counts** (size_t &num_acv, size_t &num_adiv, size_t &num_adsv, size_t &num_adrv) const
  compute all variables sums from variablesCompsTotals

• **void relax_counts** (size_t &num_cv, size_t &num_div, size_t &num_drv, size_t offset_di, size_t offset_dr) const
  adjust counts based on allRelaxedDiscrete{Int,Real}

• **void design_counts** (size_t &num_cdv, size_t &num_ddiv, size_t &num_ddsv, size_t &num_ddrv) const
  compute design variables sums from variablesCompsTotals

• **void aleatory_uncertain_counts** (size_t &num_cauv, size_t &num_dauiv, size_t &num_dausv, size_t &num_daurv) const
  compute aleatory uncertain variables sums from variablesCompsTotals

• **void epistemic_uncertain_counts** (size_t &num_ceuv, size_t &num_deuiv, size_t &num_deusv, size_t &num_deurv) const
  compute epistemic uncertain variables sums from variablesCompsTotals

• **void uncertain_counts** (size_t &num_cuv, size_t &num_duiv, size_t &num_dusv, size_t &num_durv) const
  compute uncertain variables sums from variablesCompsTotals

• **void state_counts** (size_t &num_csv, size_t &num_dsiv, size_t &num_dssv, size_t &num_dsrv) const
  compute state variables sums from variablesCompsTotals

• **void view_start_counts** (short view, size_t &cv_start, size_t &div_start, size_t &dsv_start, size_t &drv_start, size_t &num_cv, size_t &num_div, size_t &num_dsv, size_t &numDrv) const
  define start indices and counts for active variables based on view

• **void size_all_labels** ()
  size all{Continuous,DiscreteInt,DiscreteString,DiscreteReal}Labels, with or without discrete relaxation

• **void size_all_types** ()
  size all{Continuous,DiscreteInt,DiscreteString,DiscreteReal}Types, with or without discrete relaxation

• **void initialize_all_labels** (const ProblemDescDB &problem_db)
  aggregate all{Continuous,DiscreteInt,DiscreteString,DiscreteReal}Labels from user specification or defaults

• **void initialize_all_types** ()
  initialize all{Continuous,DiscreteInt,DiscreteString,DiscreteReal}Types, with or without discrete relaxation

• **void initialize_all_ids** ()
  initialize allContinuousIds (discrete not currently needed), with or without discrete relaxation

• **void initialize_active_start_counts** ()
  initialize {c,di,ds,dr}vStart and num{D,DI,DS,DR}V

• **void initialize_inactive_start_counts** ()
  initialize i{c,di,ds,dr}vStart and numI{D,DI,DS,DR}V

• **void initialize_active_components** ()
  initialize activeVarsCompsTotals given {c,di,dr}VStart and num{C,DI,DR}V

• **void initialize_inactive_components** ()
  initialize inactiveVarsCompsTotals given i{c,di,dr}VStart and numI{C,DI,DR}V

• **size_t vc_lookup** (unsigned short key) const
  retrieve the count within variablesComponents corresponding to key

• **void copy_rep** (SharedVariablesDataRep *svd_rep)
  copy the data from svd_rep to the current representation

• **template<class Archive>**
  **void save** (Archive &ar, const unsigned int version) const
serialize the core shared variables data

- template<typename Archive>

  void load(Archive &ar, const unsigned int version)

  load the core shared variables data and restore class state

- BOOST_SERIALIZATION_SPLIT_MEMBER

  String variablesId

  variables identifier string from the input file

Private Attributes

- std::map<unsigned short, size_t> variablesComponents

  map linking variable types to counts

- SizetArray variablesCompsTotals

  totals for variable type counts for {continuous, discrete integer, discrete string, discrete real} {design, aleatory uncertain, epistemic uncertain, state}.

- SizetArray activeVarsCompsTotals

  totals for active variable type counts for {continuous, discrete integer, discrete string, discrete real} {design, aleatory uncertain, epistemic uncertain, state}.

- SizetArray inactiveVarsCompsTotals

  totals for inactive variable type counts for {continuous, discrete integer, discrete string, discrete real} {design, aleatory uncertain, epistemic uncertain, state}.

- std::pair<short, short> variablesView

  the variables view pair containing active (first) and inactive (second) view enumerations

- size_t cvStart

  start index of active continuous variables within allContinuousVars

- size_t divStart

  start index of active discrete integer variables within allDiscreteIntVars

- size_t dsvStart

  start index of active discrete string vars within allDiscreteStringVars

- size_t drvStart

  start index of active discrete real variables within allDiscreteRealVars

- size_t icvStart

  start index of inactive continuous variables within allContinuousVars

- size_t idivStart

  start index of inactive discrete integer vars within allDiscreteIntVars

- size_t idsvStart

  start index of inactive discrete string vars within allDiscreteStringVars

- size_t idrvStart

  start index of inactive discrete real variables within allDiscreteRealVars

- size_t numCV

  number of active continuous variables

- size_t numDIV

  number of active discrete integer variables

- size_t numDSV

  number of active discrete string variables
- `size_t numDRV`

  *array of 1-based ids (into total variable set) for discrete string*

- `SizetMultiArray allDiscreteRealIds`  
  
  *array of 1-based ids (into total variable set) for discrete real*

- `BitArray allRelaxedDiscreteInt`  
  
  *array of booleans to indicate relaxation (promotion from DiscreteInt to Continuous) for all specified discrete int variables Note: container will be empty when not relaxing variables*

- `BitArray allRelaxedDiscreteReal`  
  
  *array of booleans to indicate relaxation (promotion from DiscreteReal to Continuous) for all specified discrete real variables Note: container will be empty when not relaxing variables*
CHAPTER 13. CLASS DOCUMENTATION

Friends

- class SharedVariablesData
- class boost::serialization::access

allow boost access to serialize this class

13.214.1 Detailed Description

The representation of a SharedVariablesData instance. This representation, or body, may be shared by multiple SharedVariablesData handle instances.

The SharedVariablesData/SharedVariablesDataRep pairs utilize a handle-body idiom (Coplien, Advanced C++).

13.214.2 Member Function Documentation

void copy_rep ( SharedVariablesDataRep * svd_rep ) [private]

copy the data from svd_rep to the current representation

Deep copies are used when recasting changes the nature of a Variables set.
References SharedVariablesDataRep::activeVarsCompsTotals, SharedVariablesDataRep::allContinuousIds, SharedVariablesDataRep::allContinuousLabels, SharedVariablesDataRep::allContinuousTypes, SharedVariablesDataRep::allDiscreteIntLabels, SharedVariablesDataRep::allDiscreteIntTypes, SharedVariablesDataRep::allDiscreteRealLabels, SharedVariablesDataRep::allDiscreteRealTypes, SharedVariablesDataRep::allDiscreteStringLabels, SharedVariablesDataRep::allDiscreteStringTypes, SharedVariablesDataRep::allRelaxedDiscreteInt, SharedVariablesDataRep::allRelaxedDiscreteReal, SharedVariablesDataRep::cvStart, SharedVariablesDataRep::divStart, SharedVariablesDataRep::drvStart, SharedVariablesDataRep::dsvStart, SharedVariablesDataRep::inactiveVarsCompsTotals, SharedVariablesDataRep::numCV, SharedVariablesDataRep::numDIV, SharedVariablesDataRep::numDRV, SharedVariablesDataRep::numDSV, SharedVariablesDataRep::numICV, SharedVariablesDataRep::numIDIV, SharedVariablesDataRep::variablesComponents, SharedVariablesDataRep::variablesCompsTotals, and SharedVariablesDataRep::variablesView.

13.214.3 Member Data Documentation

SizetArray variablesCompsTotals [private]

totals for variable type counts for \{continuous,discrete integer,discrete string,discrete real\} \{design,aleatory uncertain,epistemic uncertain,state\}.

This data reflects the variable counts as originally specified and is not altered by relaxation.

References SharedVariablesDataRep::aleatory_uncertain_counts(), SharedVariablesDataRep::all_counts(), SharedVariablesDataRep::components_to_totals(), SharedVariablesDataRep::copy_rep(), SharedVariablesDataRep::design_counts(), SharedVariablesDataRep::epistemic_uncertain_counts(), SharedVariablesDataRep::initialize_active_components(), SharedVariablesDataRep::initialize_all_ids(), SharedVariablesDataRep::initialize_components_totals(), SharedVariablesDataRep::initialize_inactive_components(), SharedVariablesDataRep::relax_noncategorical(), SharedVariablesDataRep::state_counts(), SharedVariablesDataRep::uncertain_counts(), and SharedVariablesDataRep::view_start_counts().
**SizetArray activeVarsCompsTotals**  [private]

totals for active variable type counts for \{continuous,discrete integer,discrete string,discrete real\} \{design,aleatory uncertain,epistemic uncertain,state\}.

This data reflects the variable counts as originally specified and is not altered by relaxation.

Referenced by SharedVariablesDataRep::copy_rep(), and SharedVariablesDataRep::initialize_active_components().

**SizetArray inactiveVarsCompsTotals**  [private]

totals for inactive variable type counts for \{continuous,discrete integer,discrete string,discrete real\} \{design,aleatory uncertain,epistemic uncertain,state\}.

This data reflects the variable counts as originally specified and is not altered by relaxation.

Referenced by SharedVariablesDataRep::copy_rep(), and SharedVariablesDataRep::initialize_inactive_components().

**SizetMultiArray allContinuousIds**  [private]

array of 1-based position identifiers for the all continuous variables array

These identifiers define positions of the all continuous variables array within the total variable sequence. A primary use case is for defining derivative ids (DVV) based on an active subset.

Referenced by SharedVariablesDataRep::copy_rep(), and SharedVariablesDataRep::initialize_all_ids().

The documentation for this class was generated from the following files:

- SharedVariablesData.hpp
- SharedVariablesData.cpp

### 13.215 SimulationModel Class Reference

Derived model class which utilizes a simulation-based application interface to map variables into responses.

Inheritance diagram for SimulationModel:

```
Model

SimulationModel
```

#### Public Member Functions

- **SimulationModel (ProblemDescDB &problem_db)**
  
  *constructor*

- **~SimulationModel ()**
  
  *destructor*

#### Protected Member Functions

- **Interface & derived_interface ()**
  
  Return the "default" or maximal ActiveSet for the model.

- **size_t solution_levels (bool lwr_bnd=true) const**
return size of solnControlCostMap, optionally enforcing lower bound of 1 solution level

- **void solution_level_index** (unsigned short lev_index)
  
  activate entry in solnControlCostMap

-(unsigned short) **solution_level_index ()** const
  
  return active entry in solnControlCostMap

- **RealVector solution_level_costs ()** const
  
  return all cost estimates from solnControlCostMap

- **Real solution_level_cost ()** const
  
  return active cost estimate from solnControlCostMap

- **void derived_evaluate (const ActiveSet &set)**
  
  portion of evaluate() specific to SimulationModel (invokes a synchronous map() on userDefinedInterface)

- **void derived_evaluate_nowait (const ActiveSet &set)**
  
  portion of evaluate_nowait() specific to SimulationModel (invokes an asynchronous map() on userDefinedInterface)

- **const IntResponseMap & derived_synchronize ()**
  
  portion of synchronize() specific to SimulationModel (invokes synch() on userDefinedInterface)

- **const IntResponseMap & derived_synchronize_nowait ()**
  
  portion of synchronize_nowait() specific to SimulationModel (invokes synch_nowait() on userDefinedInterface)

- **void component_parallel_mode (short mode)**
  
  SimulationModel only supports parallelism in userDefinedInterface, so this virtual function redefinition is simply a sanity check.

- **short local_eval_synchronization ()**
  
  return userDefinedInterface synchronization setting

- **int local_eval_concurrency ()**
  
  return userDefinedInterface asynchronous evaluation concurrency

- **bool derived_master_overload ()** const
  
  flag which prevents overloading the master with a multiprocessor evaluation (request forwarded to userDefinedInterface)

- **IntlIntPair estimate_partition_bounds (int max_eval_concurrency)**
  
  estimate the minimum and maximum partition sizes that can be utilized by this Model

- **void derived_init_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)**
  
  set up SimulationModel for parallel operations (request forwarded to userDefinedInterface)

- **void derived_init_serial ()**
  
  set up SimulationModel for serial operations (request forwarded to userDefinedInterface).

- **void derived_set_communicators (ParLevLIter pl_iter, int max_eval_concurrency, bool recurse_flag=true)**
  
  set active parallel configuration for the SimulationModel (request forwarded to userDefinedInterface)

- **void serve_run (ParLevLIter pl_iter, int max_eval_concurrency)**
  
  Service userDefinedInterface job requests received from the master. Completes when a termination message is received from stop_servers().

- **void stop_servers ()**
  
  executed by the master to terminate userDefinedInterface server operations when SimulationModel iteration is complete.

- **const String & interface_id ()** const
  
  return the userDefinedInterface identifier

- **int derived_evaluation_id ()** const
return the current evaluation id (simModelEvalCntr)

- **bool evaluation_cache** (bool recurse_flag=true) const
  return flag indicated usage of an evaluation cache by the SimulationModel (request forwarded to userDefinedInterface)

- **bool restart_file** (bool recurse_flag=true) const
  return flag indicated usage of a restart file by the SimulationModel (request forwarded to userDefinedInterface)

- **void set_evaluation_reference ()**
  set the evaluation counter reference points for the SimulationModel (request forwarded to userDefinedInterface)

- **void fine_grained_evaluation_counters ()**
  request fine-grained evaluation reporting within the userDefinedInterface

- **void print_evaluation_summary (std::ostream &s, bool minimal_header=false, bool relative_count=true) const**
  print the evaluation summary for the SimulationModel (request forwarded to userDefinedInterface)

- **void eval_tag_prefix (const String &eval_id_str)**
  set the hierarchical eval ID tag prefix

- **ActiveSet default_interface_active_set ()**
  Return the “default” or maximal ActiveSet for the userDefinedInterface.

- **void declare_sources ()**
  Declare this model’s sources.

### Private Member Functions

- **void initialize_solution_control (const String &control, const RealVector &cost)**
  process the solution level inputs to define solnControlVarIndex, solnControlVarType, and solnControlCostMap

### Private Attributes

- **Interface userDefinedInterface**
  the interface used for mapping variables to responses

- **short solnCntlVarType**
  type of the discrete variable that controls the set/range of solution levels

- **size_t solnCntlADVIndex**
  index of the discrete variable (within all view) that controls the set/range of solution levels

- **size_t solnCntlSetIndex**
  index of the discrete set variable (within its type array, managing offset when solnCntlVarType is a subset of all discrete variables) that controls the set/range of solution levels

- **std::map< Real, size_t > solnCntlCostMap**
  sorted array of relative costs associated with a set of solution levels

- **size_t simModelEvalCntr**
  counter for calls to derived_evaluate()/derived_evaluate_nowait()

- **IntIntMap simIdMap**
  map from userDefinedInterface evaluation ids to SimulationModel ids (may differ in case where the same interface instance is shared by multiple models)

- **IntResponseMap simResponseMap**
  map of simulation-based responses returned by derived_synchronize() and derived_synchronize_nowait()
CHAPTER 13. CLASS DOCUMENTATION

Additional Inherited Members

13.215.1 Detailed Description

Derived model class which utilizes a simulation-based application interface to map variables into responses.

The SimulationModel class is the simplest of the derived model classes. It provides the capabilities of the original Model class, prior to the development of surrogate and nested model extensions. The derived response computation and synchronization functions utilize an application interface to perform the function evaluations.

13.215.2 Member Function Documentation

Interface & derived_interface ( ) [inline], [protected], [virtual]

Return the "default" or maximal ActiveSet for the model.
return userDefinedInterface
Reimplemented from Model.
References SimulationModel::userDefinedInterface.

void eval_tag_prefix ( const String & eval_id_str ) [protected], [virtual]

set the hierarchical eval ID tag prefix
SimulationModel doesn’t need to change the tagging, so just forward to Interface
Reimplemented from Model.
References Interface::eval_tag_prefix(), and SimulationModel::userDefinedInterface.
The documentation for this class was generated from the following files:
• SimulationModel.hpp
• SimulationModel.cpp

13.216 SimulationResponse Class Reference

Container class for response functions and their derivatives. SimulationResponse provides the body class.
Inheritance diagram for SimulationResponse:

```
    Response
     |       
     | SimulationResponse
```

Public Member Functions

- SimulationResponse ()
  default constructor
- SimulationResponse (const Variables &vars, const ProblemDescDB &problem_db)
  standard constructor built from problem description database
- SimulationResponse (const SharedResponseData &srd, const ActiveSet &set)
  alternate constructor that shares a SharedResponseData instance
- SimulationResponse (const SharedResponseData &srd)
### 13.217 SNLLBASE CLASS REFERENCE

**alternate constructor that shares a SharedResponseData instance**

- `SimulationResponse (const ActiveSet &set)`
  - alternate constructor using limited data
- `~SimulationResponse ()`
  - destructor

### Additional Inherited Members

#### 13.216.1 Detailed Description

Container class for response functions and their derivatives. `SimulationResponse` provides the body class.

The `SimulationResponse` class is the "representation" of the response container class. It is the "body" portion of the "handle-body idiom" (see Coplien "Advanced C++", p. 58). The handle class (`Response`) provides for memory efficiency in management of multiple response objects through reference counting and representation sharing. The body class (`SimulationResponse`) actually contains the response data (functionValues, function-Gradients, functionHessians, etc.). The representation is hidden in that an instance of `SimulationResponse` may only be created by `Response`. Therefore, programmers create instances of the `Response` handle class, and only need to be aware of the handle/body mechanisms when it comes to managing shallow copies (shared representation) versus deep copies (separate representation used for history mechanisms).

The documentation for this class was generated from the following files:

- `SimulationResponse.hpp`
- `SimulationResponse.cpp`

### 13.217 SNLLBase Class Reference

Base class for OPT++ optimization and least squares methods.

Inherited by SNLLLeastSq, and SNLLOptimizer.

#### Public Member Functions

- `SNLLBase ()`
  - default constructor
- `SNLLBase (ProblemDescDB &problem_db)`
  - standard constructor
- `~SNLLBase ()`
  - destructor

#### Protected Member Functions

- `void copy_con_vals_dak_to_optpp (const RealVector &local_fn_vals, RealVector &g, size_t offset)`
  - convenience function for copying `local_fn_vals` to `g`; used by constraint evaluator functions
- `void copy_con_vals_optpp_to_dak (const RealVector &g, RealVector &local_fn_vals, size_t offset)`
  - convenience function for copying `g` to `local_fn_vals`; used in final solution logging
- `void copy_con_grad (const RealMatrix &local_fn_grads, RealMatrix &grad_g, size_t offset)`
  - convenience function for copying `local_fn_grads` to `grad_g`; used by constraint evaluator functions
• void `copy_con_hess` (const RealSymMatrixArray &local_fn_hessians, OPTPP::OptppArray< RealSymMatrix > &hess_g, size_t offset)

  convenience function for copying local_fn_hessians to hess_g; used by constraint evaluator functions

• void `snnl_pre_instantiate` (bool bound_constr_flag, int num_constr)

  convenience function for setting OPT++ options prior to the method instantiation

• void `snnl_post_instantiate` (int num_cv, bool vendor_num_grad_flag, const String &finite_diff_type, const RealVector &fdss, int max_iter, int max_fn_evals, Real conv_tol, Real grad_tol, Real max_step, bool bound_constr_flag, int num_constr, short output_level, OPTPP::OptimizeClass *the_optimizer, OPTPP::NLP0 *nlf_objective, OPTPP::FDNLFI1 *fd_nlf1, OPTPP::FDNLFI1 *fd_nlf1_con)

  convenience function for setting OPT++ options after the method instantiation

• void `snnl_initialize_run` (OPTPP::NLP0 *nlf_objective, OPTPP::NLP *nlp_constraint, const RealVector &init_pt, bool bound_constr_flag, const RealVector &lower_bnds, const RealVector &upper_bnds, const RealMatrix &lin_ineq_coeffs, const RealVector &lin_ineq_l_bnds, const RealVector &lin_ineq_u_bnds, const RealMatrix &lin_eq_coeffs, const RealVector &lin_eq_targets, const RealVector &nln_ineq_l_bnds, const RealMatrix &nln_ineq_u_bnds, const RealVector &nln_eq_targets)

  convenience function for OPT++ configuration prior to the method invocation

• void `snnl_post_run` (OPTPP::NLP0 *nlf_objective)

  convenience function for setting OPT++ options after the method instantiations

### Static Protected Member Functions

• static void `init_fn` (int n, RealVector &x)

  An initialization mechanism provided by OPT++ (not currently used).

### Protected Attributes

• String `searchMethod`

  value based line search, gradient based line search, trust region, or tr_pds

• OPTPP::SearchStrategy `searchStrat`

  enum: LineSearch, TrustRegion, or TrustPDS

• OPTPP::MeritFcn `meritFn`

  enum: NormFmu, ArgaezTapia, or VanShanno

• Real `maxStep`

  value from max_step specification

• Real `stepLenToBndry`

  value from steplength_to_boundary specification

• Real `centeringParam`

  value from centering parameter specification

• bool `constantASVFlag`

  flags a user selection of active set vector == constant. By mapping this into mode override, reliance on duplicate detection can be avoided.
**Static Protected Attributes**

- static `Minimizer * optLSqInstance`
  
  > pointer to the active base class object instance used within the static evaluator functions in order to avoid the need for static data

- static bool `modeOverrideFlag`
  
  > flags OPT++ mode override (for combining value, gradient, and Hessian requests)

- static `EvalType lastFnEvalLocn`
  
  > an enum used to track whether an nlf evaluator or a constraint evaluator was the last location of a function evaluation

- static int `lastEvalMode`
  
  > copy of mode from constraint evaluators

- static `RealVector lastEvalVars`
  
  > copy of variables from constraint evaluators

**13.217.1 Detailed Description**

Base class for OPT++ optimization and least squares methods.

The **SNLLBase** class provides a common base class for SNLLOptimizer and SNLLLeastSq, both of which are wrappers for OPT++, a C++ optimization library from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site.

The documentation for this class was generated from the following files:

- SNLLBase.hpp
- SNLLBase.cpp

**13.218 SNLLLeastSqTraits Class Reference**

Wrapper class for the OPT++ optimization library.

Inheritance diagram for SNLLLeastSqTraits:

**Public Member Functions**

- **SNLLLeastSqTraits ()**
  
  default constructor

- virtual **~SNLLLeastSqTraits ()**
  
  destructor

- virtual bool **is_derived ()**
  
  A temporary query used in the refactor.

- bool **supports_continuous_variables ()**
Return the flag indicating whether method supports continuous variables.

- bool supports_linear_equality ()

Return the flag indicating whether method supports linear equalities.

- bool supports_linear_inequality ()

Return the flag indicating whether method supports linear inequalities.

- bool supports_nonlinear_equality ()

Return the flag indicating whether method supports nonlinear equalities.

- bool supports_nonlinear_inequality ()

13.218.1 Detailed Description

Wrapper class for the OPT++ optimization library.

The SNLLLeastSq class provides a wrapper for OPT++, a C++ optimization library of nonlinear programming and pattern search techniques from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function, a static member, or accessed by static pointer.

The user input mappings are as follows: max_iterations, max_function_evaluations, convergence_tolerance, max_step, gradient_tolerance, search_method, and search_scheme_size are set using OPT++’s setMaxIter(), setMaxFeval(), setFcnTol(), setMaxStep(), setGradTol(), setSearchStrategy(), and setSSS() member functions, respectively; output verbosity is used to toggle OPT++’s debug mode using the setDebug() member function. Internal to OPT++, there are 3 search strategies, while the DAKOTA search_method specification supports 4 (value_based_line_search, gradient_based_line_search, trust_region, or tr_pds). The difference stems from the “is_expensive” flag in OPT++. If the search strategy is LineSearch and “is_expensive” is turned on, then the value_based_line_search is used. Otherwise (the “is_expensive” default is off), the algorithm will use the gradient_based_line_search. Refer to [Meza, J.C., 1994] and to the OPT++ source in the Dakota/packages/OPTPP directory for information on OPT++ class member functions. A version of TraitsBase specialized for SNLLLeastSq

The documentation for this class was generated from the following file:

- SNLLLeastSq.hpp

13.219 SNLLTraits Class Reference

Wrapper class for the OPT++ optimization library.

Public Member Functions

- **SNLLTraits ()**
  - default constructor
- virtual ~SNLLTraits ()
  - destructor
- virtual bool is_derived ()
  - A temporary query used in the refactor.
- bool supports_continuous_variables ()
  - Return the value of supportsContinuousVariables.
- bool supports_linear_equality ()
  - Return the flag indicating whether method supports linear equalities.
- bool supports_linear_inequality ()
  - Return the flag indicating whether method supports linear inequalities.
- bool supports_nonlinear_equality ()
  - Return the flag indicating whether method supports nonlinear equalities.
- bool supports_nonlinear_inequality ()
  - Return the flag indicating whether method supports nonlinear inequalities.
- NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format ()
  - Return the format used for nonlinear inequality constraints.

13.219.1 Detailed Description

Wrapper class for the OPT++ optimization library.

The SNLLOptimizer class provides a wrapper for OPT++, a C++ optimization library of nonlinear programming and pattern search techniques from the Computational Sciences and Mathematics Research (CSMR) department at Sandia’s Livermore CA site. It uses a function pointer approach for which passed functions must be either global functions or static member functions. Any attribute used within static member functions must be either local to that function, a static member, or accessed by static pointer.

The user input mappings are as follows: `max_iterations`, `max_function_evaluations`, `convergence_tolerance`, `max_step`, `gradient_tolerance`, `search_method`, and `search_scheme_size` are set using OPT++’s `setMaxIter()`, `setMaxFeval()`, `setFcnTol()`, `setMaxStep()`, `setGradTol()`, `setSearchStrategy()`, and `setSSS()` member functions, respectively; output verbosity is used to toggle OPT++’s debug mode using the `setDebug()` member function. Internal to OPT++, there are 3 search strategies, while the DAKOTA `search_method` specification supports 4 (`value_based_line_search`, `gradient_based_line_search`, `trust_region`, or `tr_pds`). The difference stems from the “is_expensive” flag in OPT++. If the search strategy is `LineSearch` and “is_expensive” is turned on, then the `value_based_line_search` is used. Otherwise (the “is_expensive” default is off), the algorithm will use the `gradient_based_line_search`. Refer to [Meza, J.C., 1994] and to the OPT++ source in the Dakota/packages/OPTPP directory for information on OPT++ class member functions. A version of TraitsBase specialized for SNLL optimizers

The documentation for this class was generated from the following file:

- SNLLOptimizer.hpp

13.220 SOLBase Class Reference

Base class for Stanford SOL software.

Inherited by NLSSOLLeastSq, and NPSOLOptimizer.
Public Member Functions

- **SOLBase ()**
  default constructor
- **SOLBase (Model &model)**
  standard constructor
- **~SOLBase ()**
  destructor

Protected Member Functions

- **void allocate_arrays (int num_cv, size_t num_nln_con, const RealMatrix &lin_ineq_coeffs, const RealMatrix &lin_eq_coeffs)**
  Allocates miscellaneous arrays for the SOL algorithms.
- **void deallocate_arrays ()**
  Deallocates memory previously allocated by allocate_arrays().
- **void allocate_workspace (int num_cv, int num_nln_con, int num_lin_con, int num_lsq)**
  Allocates real and integer workspaces for the SOL algorithms.
- **void set_options (bool speculative_flag, bool vendor_num_grad_flag, short output_level, int verify_level, Real fn_prec, Real linesrch_tol, int max_iter, Real constr_tol, Real conv_tol, const std::string &grad_type, const RealVector &fdss)**
  Sets SOL method options using calls to npoptn2.
- **void augment_bounds (RealVector &augmented_l_bnds, RealVector &augmented_u_bnds, const Model &model)**
  augments variable bounds with linear and nonlinear constraint bounds.
- **void augment_bounds (RealVector &augmented_l_bnds, RealVector &augmented_u_bnds, const RealVector &lin_ineq_l_bnds, const RealVector &lin_ineq_u_bnds, const RealVector &lin_eq_targets, const RealVector &nln_ineq_l_bnds, const RealVector &nln_ineq_u_bnds, const RealVector &nln_eq_targets)**
  augments variable bounds with linear and nonlinear constraint bounds.

Static Protected Member Functions

- **static void constraint_eval (int &mode, int &ncnln, int &n, int &nrowj, int *needc, double *x, double *c, double *cjac, int &nstate)**
  **CONFUN in NPSOL manual**: computes the values and first derivatives of the nonlinear constraint functions.

Protected Attributes

- int **realWorkSpaceSize**
  size of realWorkSpace
- int **intWorkSpaceSize**
  size of intWorkSpace
- RealArray **realWorkSpace**
  real work space for NPSOL/NLSSOL
- IntArray **intWorkSpace**
  int work space for NPSOL/NLSSOL
- int **nlnConstraintArraySize**
used for non-zero array sizing (nonlinear constraints)

- int linConstraintArraySize
  used for non-zero array sizing (linear constraints)

- RealArray cLambda
  CLAMBDA from NPSOL manual: Lagrange multipliers.

- IntArray constraintState
  ISTATE from NPSOL manual: constraint status.

- int informResult
  INFORM from NPSOL manual: optimization status on exit.

- int numberIterations
  ITER from NPSOL manual: number of (major) iterations performed.

- int boundsArraySize
  length of augmented bounds arrays (variable bounds plus linear and nonlinear constraint bounds)

- double * linConstraintMatrixF77
  [A] matrix from NPSOL manual: linear constraint coefficients

- double * upperFactorHessianF77

- double * constraintJacMatrixF77
  [CJAC] matrix from NPSOL manual: nonlinear constraint Jacobian

- int fnEvalCntr
  counter for testing against maxFunctionEvals

- size_t constrOffset
  used in constraint_eval() to bridge NLSSOLLeastSq::numLeastSqTerms and NPSOLOptimizer::numObjectiveFns

Static Protected Attributes

- static SOLBase * solInstance
  pointer to the active object instance used within the static evaluator functions in order to avoid the need for static data

- static Minimizer * optLSqInstance
  pointer to the active base class object instance used within the static evaluator functions in order to avoid the need for static data

13.220.1 Detailed Description

Base class for Stanford SOL software.

The SOLBase class provides a common base class for NPSOLOptimizer and NLSSOLLeastSq, both of which are Fortran 77 sequential quadratic programming algorithms from Stanford University marketed by Stanford Business Associates.

The documentation for this class was generated from the following files:

- SOLBase.hpp
- SOLBase.cpp
13.221 SpawnApplicInterface Class Reference

Derived application interface class which spawns simulation codes using spawnvp.

Inheritance diagram for SpawnApplicInterface:

```
Interface
   + ApplicationInterface
     |   ProcessApplicInterface
     |     ProcessHandleApplicInterface
     |                         SpawnApplicInterface
```

Public Member Functions

- **SpawnApplicInterface** (const ProblemDescDB &problem_db)
  *constructor*

- **~SpawnApplicInterface** ()
  *destructor*

Protected Member Functions

- void **wait_local_evaluations** (PRPQueue &prp_queue)
  *For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version waits for at least one completion.*

- void **test_local_evaluations** (PRPQueue &prp_queue)
  *For asynchronous function evaluations, this method is used to detect completion of jobs and process their results. It provides the processing code that is specific to derived classes. This version is nonblocking and will return without any completions if none are immediately available.*

- pid_t **create_analysis_process** (bool block_flag, bool new_group)
  *spawn a child process for an analysis component within an evaluation*

- size_t **wait_localyses** ()
  *wait for asynchronous analyses on the local processor, completing at least one job*

- size_t **test_localyses_send** (int analysis_id)
  *test for asynchronous analysis completions on the local processor and return results for any completions by sending messages*

Additional Inherited Members

13.221.1 Detailed Description

Derived application interface class which spawns simulation codes using spawnvp.
SpawnApplicInterface is used on Windows systems and is a peer to ForkApplicInterface for Unix systems. The documentation for this class was generated from the following files:

- SpawnApplicInterface.hpp
- SpawnApplicInterface.cpp

## 13.222 StringScale Struct Reference

Data structure for storing string-valued dimension scale.

### Public Member Functions

- **StringScale** (const std::string &in_label, const char ∗ const in_items[], const int &len, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes a C-style array of C-strings.

- **StringScale** (const std::string &in_label, std::initializer_list< const char ∗ > in_items, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes and initializer list of string literals.

- **StringScale** (const std::string &in_label, const std::vector<String> &in_items, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes a vector of strings.

- **StringScale** (const std::string &in_label, std::vector< const char ∗ > in_items, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes a vector of C-style strings.

- **StringScale** (const std::string &in_label, const StringMultiArrayConstView in_items, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes a StringMultiArrayConstView.

- **StringScale** (const std::string &in_label, const std::vector< String > &in_items, const size_t first, const size_t num, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes indexes into a StringArray.

- **StringScale** (const std::string &in_label, std::vector< std::vector< const char ∗ > > in_items, ScaleScope in_scope=ScaleScope::UNSHARED)

  Constructor that takes a vector<vector<const char ∗ >> to produce a 2D scale.

### Public Attributes

- std::string label

  Scale label.

- ScaleScope scope

  Scale scope (whether the scaled is shared among responses)

- std::vector< const char ∗ > items

  Pointers to the strings that make up the scale.

- int numCols

  Number of columns; equals length of scale when 1D.

- bool isMatrix

  2d or 1d?
13.222.1 Detailed Description

Data structure for storing string-valued dimension scale.

The documentation for this struct was generated from the following file:

- dakota_results_types.hpp

13.223 SurfpackApproximation Class Reference

Derived approximation class for Surfpack approximation classes. Interface between Surfpack and Dakota.

Inheritance diagram for SurfpackApproximation:

```
Approximation
  SurfpackApproximation
```

Public Member Functions

- **SurfpackApproximation ()**
  default constructor
- **SurfpackApproximation (const ProblemDescDB &problem_db, const SharedApproxData &shared_data, const String &approx_label)**
  standard constructor: Surfpack surface of appropriate type will be created
- **SurfpackApproximation (const SharedApproxData &shared_data)**
  alternate constructor
- **~SurfpackApproximation ()**
  destructor

Protected Member Functions

- **int min_coefficients () const**
  return the minimum number of samples (unknowns) required to build the derived class approximation type in num- Vars dimensions
- **int recommended_coefficients () const**
  return the recommended number of samples (unknowns) required to build the derived class approximation type in numVars dimensions
- **void build ()**
  SurfData object will be created from Dakota’s SurrogateData, and the appropriate Surfpack build method will be invoked.
- **void export_model (const String &fn_label, const String &export_prefix="", const unsigned short export_format=NO_MODEL_FORMAT)**
  export the Surfpack model to disk or console
- **Real value (const Variables &vars)**
  Return the value of the Surfpack surface for a given parameter vector x.
• const RealVector & gradient (const Variables &vars)
  retrieve the approximate function gradient for a given parameter vector x
• const RealSymMatrix & hessian (const Variables &vars)
  retrieve the approximate function Hessian for a given parameter vector x
• Real prediction_variance (const Variables &vars)
  retrieve the variance of the predicted value for a given parameter set x (KrigingModel only)
• Real value (const RealVector &c_vars)
  Return the value of the Surfpack surface for a given parameter vector x.
• const RealVector & gradient (const RealVector &c_vars)
  retrieve the approximate function gradient for a given parameter vector x
• const RealSymMatrix & hessian (const RealVector &c_vars)
  retrieve the approximate function Hessian for a given parameter vector x
• Real prediction_variance (const RealVector &c_vars)
  retrieve the variance of the predicted value for a given parameter set x (KrigingModel only)
• bool diagnostics_available ()
  check if the diagnostics are available (true for the Surfpack types)
• Real diagnostic (const String &metric_type)
  retrieve a single diagnostic metric for the diagnostic type specified on the primary model and data
• Real diagnostic (const String &metric_type, const SurfpackModel &model, const SurfData &data)
  retrieve a single diagnostic metric for the diagnostic type specified on the given model and data
• void primary_diagnostics (int fn_index)
  compute and print all requested diagnostics and cross-validation
• void challenge_diagnostics (int fn_index, const RealMatrix &challenge_points, const RealVector &challenge_responses)
  compute and print all requested diagnostics for user provided challenge pts
• RealArray cv_diagnostic (const StringArray &metric_types, unsigned num_folds)
  compute and return cross-validation for metric_type with num_folds
• RealArray challenge_diagnostic (const StringArray &metric_types, const RealMatrix &challenge_points, const RealVector &challenge_responses)
  compute and print all requested diagnostics for user provided challenge pts

Private Member Functions

• SurfData * surrogates_to_surf_data ()
  copy from SurrogateData to SurfPoint/SurfData
• void add_constraints_to_surfdata (const Pecos::SurrogateDataVars &anchor_vars, const Pecos::SurrogateDataResp &anchor_resps, short fail_code, SurfData &surf_data)
  set the anchor point (including gradient and hessian if present) into surf_data
Private Attributes

- SurfpackModel * model
  The native Surfpack approximation.
- SurfpackModelFactory * factory
  factory for the SurfpackModel instance
- SurfData * surfData
  The data used to build the approximation, in Surfpack format.

Additional Inherited Members

13.223.1 Detailed Description

Derived approximation class for Surfpack approximation classes. Interface between Surfpack and Dakota.

The SurfpackApproximation class is the interface between Dakota and Surfpack. Based on the information in the ProblemDescDB that is passed in through the constructor, SurfpackApproximation builds a Surfpack Surface object that corresponds to one of the following data-fitting techniques: polynomial regression, kriging, artificial neural networks, radial basis function network, or multivariate adaptive regression splines (MARS).

13.223.2 Constructor & Destructor Documentation

SurfpackApproximation ( const ProblemDescDB & problem_db, const SharedApproxData & shared_data, const String & approx_label )

standard constructor: Surfpack surface of appropriate type will be created

Initialize the embedded Surfpack surface object and configure it using the specifications from the input file. Data for the surface is created later.

References Dakota::abort_handler(), SharedSurfpackApproxData::approxOrder, SharedApproxData::approxType, SharedApproxData::buildDataOrder, Dakota::copy_data(), SharedSurfpackApproxData::crossValidateFlag, SharedSurfpackApproxData::diagnosticSet, SurfpackApproximation::factory, ProblemDescDB::get_real(), ProblemDescDB::get_rv(), ProblemDescDB::get_short(), ProblemDescDB::get_string(), SharedSurfpackApproxData::numFolds, SharedApproxData::numVars, SharedApproxData::outputLevel, SharedSurfpackApproxData::percentFold, and Approximation::sharedDataRep.

SurfpackApproximation ( const SharedApproxData & shared_data )

alternate constructor

On-the-fly constructor which uses mostly Surfpack model defaults.

References Dakota::abort_handler(), SharedSurfpackApproxData::approxOrder, SharedApproxData::approxType, SharedApproxData::buildDataOrder, SurfpackApproximation::factory, SharedApproxData::numVars, SharedApproxData::outputLevel, and Approximation::sharedDataRep.

13.223.3 Member Function Documentation

void build ( ) [protected], [virtual]

SurfData object will be created from Dakota’s SurrogateData, and the appropriate Surfpack build method will be invoked.

surfData will be deleted in dtor
Todo Right now, we’re completely deleting the old data and then recopying the current data into a SurfData object. This was just the easiest way to arrive at a solution that would build and run. This function is frequently called from addPoint rebuild, however, and it’s not good to go through this whole process every time one more data point is added.

Reimplemented from Approximation.
References Dakota::abort_handler(), SharedApproxData::approxCLowerBnds, SharedApproxData::approxCUpperBnds, SharedApproxData::approxDLowerBnds, SharedApproxData::approxDUpperBnds, SharedApproxData::approxDRLowerBnds, SharedApproxData::approxDRUpperBnds, Approximation::build(), SurfpackApproximation::factory, SharedSurfpackApproxData::merge_variable_arrays(), SurfpackApproximation::model, Approximation::sharedDataRep, SurfpackApproximation::surfData, and SurfpackApproximation::surrogates_to_surf_data().

```cpp
const RealSymMatrix & hessian ( const Variables & vars ) [protected], [virtual]
```

retrieve the approximate function Hessian for a given parameter vector x

Todo Make this acceptably efficient

Reimplemented from Approximation.
References Dakota::abort_handler(), Approximation::approxHessian, SharedApproxData::approxType, Variables::cv(), SurfpackApproximation::model, and Approximation::sharedDataRep. Referenced by SurfpackApproximation::add_constraints_to_surfdata().

```cpp
const RealSymMatrix & hessian ( const RealVector & c_vars ) [protected], [virtual]
```

retrieve the approximate function Hessian for a given parameter vector x

Todo Make this acceptably efficient

Reimplemented from Approximation.
References Dakota::abort_handler(), Approximation::approxHessian, SharedApproxData::approxType, SurfpackApproximation::model, and Approximation::sharedDataRep.

```cpp
SurfData * surrogates_to_surf_data ( ) [private]
```

copy from SurrogateData to SurfPoint/SurfData

Copy the data stored in Dakota-style SurrogateData into Surfpack-style SurfPoint and SurfData objects.

References Dakota::NPOS, SurfpackApproximation::add_constraints_to_surfdata(), SharedSurfpackApproxData::add_sd_to_surfdata(), SharedApproxData::buildDataOrder, SurfpackApproximation::factory, SharedApproxData::outputLevel, Approximation::sharedDataRep, and Approximation::surrogate_data(). Referenced by SurfpackApproximation::build().

```cpp
void add_constraints_to_surfdata ( const Pecos::SurrogateDataVars & anchor_vars, const Pecos::SurrogateDataResp & anchor_resp, short fail_code, SurfData & surf_data ) [private]
```

set the anchor point (including gradient and hessian if present) into surf_data

If there is an anchor point, add an equality constraint for its response value. Also add constraints for gradient and hessian, if applicable.

References Dakota::abort_handler(), Dakota::copy_data(), SharedSurfpackApproxData::copy_matrix(), SurfpackApproximation::gradient(), SurfpackApproximation::hessian(), SharedApproxData::outputLevel, SharedSurfpackApproxData::sdv_to_rearray(), Approximation::sharedDataRep, and Dakota::write_data(). Referenced by SurfpackApproximation::surrogates_to_surf_data().

13.224 SurrBasedGlobalMinimizer Class Reference

Inheritance diagram for SurrBasedGlobalMinimizer:

```
  Iterator
   
  Minimizer
   
  SurrBasedMinimizer
   
  SurrBasedGlobalMinimizer
```

Public Member Functions

- SurrBasedGlobalMinimizer (ProblemDescDB &problem_db, Model &model)
  constructor
- ~SurrBasedGlobalMinimizer ()
  destructor

Protected Member Functions

- void core_run ()
  Performs global surrogate-based optimization by repeatedly optimizing on and improving surrogates of the response functions.
- bool returns_multiple_points () const
  Global surrogate-based methods can return multiple points.

Private Attributes

- bool replacePoints
  flag for replacing the previous iteration’s point additions, rather than continuing to append, during construction of the next surrogate

Additional Inherited Members

13.224.1 Detailed Description

This method uses a SurrogateModel to perform minimization (optimization or nonlinear least squares) through a set of iterations. At each iteration, a surrogate is built, the surrogate is minimized, and the optimal points from the surrogate are then evaluated with the "true" function, to generate new points upon which the surrogate for the next iteration is built.

The documentation for this class was generated from the following files:

- SurfpackApproximation.hpp
- SurfpackApproximation.cpp
13.225. **SurrBasedGlobalTraits Class Reference**

The global surrogate-based minimizer which sequentially minimizes and updates a global surrogate model without trust region controls.

  *update the trust region bounds, strictly contained within global bounds*

- virtual void `build` ()=0
  
  *build the approximation over the current trust region*

- virtual void `minimize` ()
  
  *solve the approximate subproblem*

- virtual void `verify` ()=0
verify the approximate iterate and update the trust region for the next approximate optimization cycle
• virtual unsigned short converged ()=0
  return the convergence code for the truth level of the trust region hierarchy
• void initialize_sub_model ()
  construct and initialize approxSubProbModel
• void initialize_sub_minimizer ()
  construct and initialize approxSubProbMinimizer
• void initialize_multipliers ()
  initialize lagrangeMult and augLagrangeMult
• void reset_penalties ()
  reset all penalty parameters to their initial values
• void reset_multipliers ()
  reset Lagrange multipliers to initial values for cases where they are accumulated instead of computed directly
• void update_trust_region_data (SurrBasedLevelData &tr_data, const RealVector &parent_l_bnds, const RealVector &parent_u_bnds)
  update the trust region bounds, strictly contained within global bounds
• void update_approx_sub_problem (SurrBasedLevelData &tr_data)
  update variables and bounds within approxSubProbModel
• void compute_trust_region_ratio (SurrBasedLevelData &tr_data, bool check_interior=false)
  compute trust region ratio (for SBLM iterate acceptance and trust region resizing) and check for soft convergence (diminishing returns)
• void hard_convergence_check (SurrBasedLevelData &tr_data, const RealVector &lower_bnds, const RealVector &upper_bnds)
  check for hard convergence (norm of projected gradient of merit function < tolerance)
• void print_convergence_code (std::ostream &s, unsigned short code)
  print out the state corresponding to the code returned by converged()
• void update_penalty (const RealVector &fns_center_truth, const RealVector &fns_star_truth)
  initialize and update the penaltyParameter
• bool find_approx_response (const Variables &search_vars, Response &search_resp)
  locate an approximate response with the data_pairs cache
• bool find_truth_response (const Variables &search_vars, Response &search_resp)
  locate a truth response with the data_pairs cache
• bool find_response (const Variables &search_vars, Response &search_resp, const String &search_id, short set_request)
  locate a response with the data_pairs cache
• void relax_constraints (SurrBasedLevelData &tr_data)
  relax constraints by updating bounds when current iterate is infeasible

Static Protected Member Functions
• static void approx_subprob_objective_eval (const Variables &surrogate_vars, const Variables &recast_vars, const Response &surrogate_response, Response &recast_response)
  static function used to define the approximate subproblem objective.
• static void approx_subprob_constraint_eval (const Variables &surrogate_vars, const Variables &recast_vars, const Response &surrogate_response, Response &recast_response)
static function used to define the approximate subproblem constraints.

- static void `hom_objective_eval` (int &mode, int &n, double *tau_and_x, double &f, double *grad_f, int &)
  static function used by NPSOL as the objective function in the homotopy constraint relaxation formulation.

- static void `hom_constraint_eval` (int &mode, int &ncnln, int &n, int &nrowj, int *needc, double *tau_and_x, double *c, double *cjac, int &nstate)
  static function used by NPSOL as the constraint function in the homotopy constraint relaxation formulation.

Protected Attributes

- Model `approxSubProbModel`
  the approximate sub-problem formulation solved on each approximate minimization cycle: may be a shallow copy of iteratedModel, or may involve a RecastModel recursion applied to iteratedModel

- short `approxSubProbObj`
  type of approximate subproblem objective: ORIGINAL_OBJ, LAGRANGIAN_OBJ, or AUGMENTED_LAGRANGIAN_OBJ

- short `approxSubProbCon`
  type of approximate subproblem constraints: NO_CON, LINEARIZED_CON, or ORIGINAL_CON

- bool `recastSubProb`
  flag to indicate when approxSubProbModel involves a RecastModel recursion

- short `meritFnType`
  type of merit function used in trust region ratio logic: PENALTY_MERIT, ADAPTIVE_PENALTY_MERIT, LAGRANGIAN_MERIT, or AUGMENTED_LAGRANGIAN_MERIT

- short `acceptLogic`
  type of iterate acceptance test logic: FILTER or TR_RATIO

- short `trConstraintRelax`
  type of trust region constraint relaxation for infeasible starting points: NO_RELAX or HOMOTOPY

- int `minimizeCycles`
  counter for number of minimization cycles that have accumulated prior to convergence at the minimizeIndex level (used for ramping penalties)

- int `penaltyIterOffset`
  iteration offset used to update the scaling of the penalty parameter for adaptive_penalty merit functions

- RealVector `origTrustRegionFactor`
  original user specification for trust region initial size

- Real `minTrustRegionFactor`
  a soft convergence control: stop SBLM when the trust region factor is reduced below the value of minTrustRegionFactor

- Real `trRatioContractValue`
  trust region ratio min value: contract tr if ratio below this value

- Real `trRatioExpandValue`
  trust region ratio sufficient value: expand tr if ratio above this value

- Real `gammaContract`
  trust region contraction factor

- Real `gammaExpand`
  trust region expansion factor

- unsigned short `softConvLimit`
convergence control limiting the number of consecutive iterations that fail to achieve sufficient decrease. If exceeded by softConvCount, stop.

- short truthSetRequest
derivative order of truth data used within the SBLM process
- short approxSetRequest
derivative order of surrogate data used within the SBLM process
- short correctionType
flags the use of surrogate correction techniques at the center of each trust region
- RealVector initialPoint
starting point prior to sequence of SBLM iterations
- RealVector globalLowerBnds
Global lower bounds.
- RealVector globalUpperBnds
Global Upper bounds.
- RealVector nonlinIneqLowerBndsSlack
individual violations of nonlinear inequality constraint lower bounds
- RealVector nonlinIneqUpperBndsSlack
individual violations of nonlinear inequality constraint upper bounds
- RealVector nonlinEqTargetsSlack
individual violations of nonlinear equality constraint targets
- Real tau
constraint relaxation parameter
- Real alpha
constraint relaxation parameter backoff parameter (multiplier)

**Static Protected Attributes**

- static SurrBasedLocalMinimizer * sblmInstance
  pointer to SBLM instance used in static member functions

**Additional Inherited Members**

### 13.226.1 Detailed Description

Class for provably-convergent local surrogate-based optimization and nonlinear least squares.

This minimizer uses a SurrogateModel to perform minimization based on local, global, or hierarchical surrogates. It achieves provable convergence through the use of a sequence of trust regions and the application of surrogate corrections at the trust region centers.

### 13.226.2 Member Function Documentation

`void pre_run ( ) [protected], [virtual]`

pre-run portion of run (optional); re-implemented by Iterators which can generate all Variables (parameter sets) a priori
pre-run phase, which a derived iterator may optionally reimplement; when not present, pre-run is likely inte-
grated into the derived run function. This is a virtual function; when re-implementing, a derived class must call
tests nearest parent’s pre_run(), if implemented, typically before performing its own implementation steps.
Reimplemented from Iterator.
References Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Model::continuous_variables(),
SurrBasedLocalMinimizer::converged(), Dakota::copy_data(), SurrBasedLocalMinimizer::globalLowerBnds, Surr-
BasedLocalMinimizer::globalUpperBnds, SurrBasedLocalMinimizer::initialPoint, Iterator::iteratedModel, and Surr-
BasedLocalMinimizer::reset().

void core_run() [protected], [virtual]
Performs local surrogate-based minimization by minimizing local, global, or hierarchical surrogates over a series
of trust regions.
Trust region-based strategy to perform surrogate-based optimization in subregions (trust regions) of the param-
eter space. The minimizer operates on approximations in lieu of the more expensive simulation-based response
functions. The size of the trust region is adapted according to the agreement between the approximations and the
true response functions.
Reimplemented from Iterator.
References SurrBasedLocalMinimizer::build(), SurrBasedLocalMinimizer::converged(), SurrBasedLocalMinimizer-
::minimize(), SurrBasedLocalMinimizer::sblmInstance, SurrBasedLocalMinimizer::update_trust_region(), and Surr-
BasedLocalMinimizer::verify().

void post_run( std::ostream & s ) [protected], [virtual]
post-run portion of run (optional); verbose to print results; re-implemented by Iterators that can read all Variables/
Responses and perform final analysis phase in a standalone way
Post-run phase, which a derived iterator may optionally reimplement; when not present, post-run is likely
integrated into run. This is a virtual function; when re-implementing, a derived class must call its nearest parent’s
post_run(), typically after performing its own implementation steps.
Reimplemented from Minimizer.
References SurrBasedLocalMinimizer::converged(), SurrBasedMinimizer::globalIterCount, Minimizer::post-
_run(), and SurrBasedLocalMinimizer::print_convergence_code().

void compute_trust_region_ratio( SurrBasedLevelData & tr_data, bool check_interior = false ) [protected]
compute trust region ratio (for SBLM iterate acceptance and trust region resizing) and check for soft convergence
(diminishing returns)
Assess acceptance of SBLM iterate (trust region ratio or filter) and compute soft convergence metrics (number
of consecutive failures, min trust region size, etc.) to assess whether the convergence rate has decreased to a point
where the process should be terminated (diminishing returns).
References SurrBasedLocalMinimizer::acceptLogic, SurrBasedLocalMinimizer::approxSubProbObj, SurrBased-
Minimizer::augmented_lagrangian_merit(), SurrBasedMinimizer::constraint_violation(), Minimizer::constraintTol,
Iterator::convergenceTol, SurrBasedMinimizer::etaSequence, Response::function_values(), SurrBasedLocalMinimizer-
::gammaContract, SurrBasedLocalMinimizer::gammaExpand, SurrBasedLocalMinimizer::globalLowerBnds, Surr-

Model, SurrBasedMinimizer::lagrangian_merit(), SurrBasedLocalMinimizer::meritFnType, Minimizer::numContinuous-
Vars, Minimizer::numNonlinearConstraints, Minimizer::objective(), SurrBasedMinimizer::origNonlinEqTargets,
void hard_convergence_check ( SurrBasedLevelData & tr_data, const RealVector & lower_bnds, const RealVector & upper_bnds ) [protected]

check for hard convergence (norm of projected gradient of merit function < tolerance)

The hard convergence check computes the gradient of the merit function at the trust region center, performs a projection for active bound constraints (removing any gradient component directed into an active bound), and signals convergence if the 2-norm of this projected gradient is less than convergenceTol.

References SurrBasedLocalMinimizer::approxSubProbObj, SurrBasedMinimizer::constraint_violation(), Minimizer::constraintTol, Iterator::convergenceTol, Response::function_gradients(), Response::function_values(), Iterator::iteratedModel, SurrBasedMinimizer::lagrangian_gradient(), SurrBasedLocalMinimizer::meritFnType, SurrBasedLocalMinimizer::minimizeCycles, Minimizer::numContinuousVars, Minimizer::numNonlinearConstraints, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, Iterator::outputLevel, Model::primary_response_fn_sense(), Model::primary_response_fn_weights(), SurrBasedLocalMinimizer::truthSetRequest, SurrBasedMinimizer::update_augmented_lagrange_multipliers(), and SurrBasedLocalMinimizer::update_penalty().

void update_penalty ( const RealVector & fns_center_truth, const RealVector & fns_star_truth ) [protected]

initialize and update the penaltyParameter

Scaling of the penalty value is important to avoid rejecting SBLM iterates which must increase the objective to achieve a reduction in constraint violation. In the basic penalty case, the penalty is ramped exponentially based on the iteration counter. In the adaptive case, the ratio of relative change between center and star points for the objective and constraint violation values is used to rescale penalty values.

References SurrBasedMinimizer::alphaEta, SurrBasedLocalMinimizer::approxSubProbObj, SurrBasedMinimizer::constraint_violation(), Minimizer::constraintTol, Iterator::convergenceTol, Response::function_gradients(), Response::function_values(), Iterator::iteratedModel, SurrBasedLocalMinimizer::lagrangian_gradient(), SurrBasedLocalMinimizer::meritFnType, SurrBasedLocalMinimizer::minimizeCycles, Minimizer::objective(), Iterator::outputLevel, SurrBasedLocalMinimizer::penaltyIterOffset, SurrBasedMinimizer::penaltyParameter, Model::primary_response_fn_sense(), and Model::primary_response_fn_weights().

## 13.227 SurrBasedMinimizer Class Reference

Base class for local/global surrogate-based optimization/least squares.

Inheritance diagram for SurrBasedMinimizer:
Protected Member Functions

- **SurrBasedMinimizer** (ProblemDescDB &problem_db, Model &model, std::shared_ptr<TraitsBase> traits)
  
  constructor

- **~SurrBasedMinimizer** ()
  
  destructor

- void derived_init_communicators (ParLevLIter pl_iter)
  
  derived class contributions to initializing the communicators associated with this Iterator instance

- void derived_set_communicators (ParLevLIter pl_iter)
  
  derived class contributions to setting the communicators associated with this Iterator instance

- void derived_free_communicators (ParLevLIter pl_iter)
  
  derived class contributions to freeing the communicators associated with this Iterator instance

- void initialize_graphics (int iterator_server_id=1)
  
  initialize graphics customized for surrogate-based iteration

- void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  
  print results

- void update_lagrange_multipliers (const RealVector &fn_vals, const RealMatrix &fn_grads, SurrBasedLevelData &tr_data)
  
  initialize and update Lagrange multipliers for basic Lagrangian

- void update_augmented_lagrange_multipliers (const RealVector &fn_vals)
  
  initialize and update the Lagrange multipliers for augmented Lagrangian

- void initialize_filter (SurrBasedLevelData &tr_data, const RealVector &fn_vals)
  
  (re-)initialize filter from a set of function values

- bool update_filter (SurrBasedLevelData &tr_data, const RealVector &fn_vals)
  
  update filter using a new set of function values

- Real lagrangianMerit (const RealVector &fn_vals, const BoolDeque &sense, const RealVector &primary_wts, const RealVector &lnl_ineq_l_bnds, const RealVector &lnl_ineq_u_bnds, const RealVector &lnl_eq_tgts)
  
  compute a Lagrangian function from a set of function values

- void lagrangian_gradient (const RealVector &fn_vals, const RealMatrix &fn_grads, const BoolDeque &sense, const RealVector &primary_wts, const RealVector &lnl_ineq_l_bnds, const RealVector &lnl_ineq_u_bnds, const RealVector &lnl_eq_tgts, RealVector &lagGrad)
  
  compute the gradient of the Lagrangian function
void lagrangian_hessian (const RealVector &fn_vals, const RealMatrix &fn_grads, const RealSymMatrixArray &fn_hessians, const BoolDeque &sense, const RealVector &primary_wts, const RealVector &nln_ineq_l_bnds, const RealVector &nln_ineq_u_bnds, const RealVector &nln_eq_tgts, RealSymMatrix &lag_hess)

   compute the Hessian of the Lagrangian function

Real augmented_lagrangian_merit (const RealVector &fn_vals, const BoolDeque &sense, const RealVector &primary_wts, const RealVector &nln_ineq_l_bnds, const RealVector &nln_ineq_u_bnds, const RealVector &nln_eq_tgts)

   compute an augmented Lagrangian function from a set of function values

void augmented_lagrangian_gradient (const RealVector &fn_vals, const RealMatrix &fn_grads, const BoolDeque &sense, const RealVector &primary_wts, const RealVector &nln_ineq_l_bnds, const RealVector &nln_ineq_u_bnds, const RealVector &nln_eq_tgts, RealVector &alag_grad)

   compute the gradient of the augmented Lagrangian function

void augmented_lagrangian_hessian (const RealVector &fn_vals, const RealMatrix &fn_grads, const RealSymMatrixArray &fn_hessians, const BoolDeque &sense, const RealVector &primary_wts, const RealVector &nln_ineq_l_bnds, const RealVector &nln_ineq_u_bnds, const RealVector &nln_eq_tgts, RealSymMatrix &alag_hess)

   compute the Hessian of the augmented Lagrangian function

Real penalty_merit (const RealVector &fn_vals, const BoolDeque &sense, const RealVector &primary_wts)

   compute a penalty function from a set of function values

void penalty_gradient (const RealVector &fn_vals, const RealMatrix &fn_grads, const BoolDeque &sense, const RealVector &primary_wts, RealVector &pen_grad)

   compute the gradient of the penalty function

Real constraint_violation (const RealVector &fn_vals, const Real &constraint_tol)

   compute the constraint violation from a set of function values

Protected Attributes

- Iterator approxSubProbMinimizer
  the minimizer used on the surrogate model to solve the approximate subproblem on each surrogate-based iteration

- size_t globalIterCount
  global iteration counter corresponding to number of surrogate-based minimizations

- RealVector lagrangeMult
  Lagrange multipliers for basic Lagrangian calculations.

- RealVector augLagrangeMult
  Lagrange multipliers for augmented Lagrangian calculations.

- Real penaltyParameter
  the penalization factor for violated constraints used in quadratic penalty calculations; increased in update_penalty()

- RealVector origNonlinIneqLowerBnds
  original nonlinear inequality constraint lower bounds (no relaxation)

- RealVector origNonlinIneqUpperBnds
  original nonlinear inequality constraint upper bounds (no relaxation)

- RealVector origNonlinEqTargets
  original nonlinear equality constraint targets (no relaxation)
• Real eta
  
  *constant used in etaSequence updates*

• Real alphaEta

  *power for etaSequence updates when updating penalty*

• Real betaEta

  *power for etaSequence updates when updating multipliers*

• Real etaSequence

  *decreasing sequence of allowable constraint violation used in augmented Lagrangian updates (refer to Conn, Gould, and Toint, section 14.4)*

• size_t miPLIndex

  *index for the active ParallelLevel within ParallelConfiguration::miPLI ters*

### Additional Inherited Members

#### 13.227.1 Detailed Description

Base class for local/global surrogate-based optimization/least squares.

These minimizers use a SurrogateModel to perform optimization based either on local trust region methods or global updating methods.

#### 13.227.2 Member Function Documentation

**void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]**

Redefines default iterator results printing to include optimization results (objective functions and constraints).

Reimplemented from Iterator.

References Dakota::abort_handler(), Iterator::activeSet, Iterator::bestResponseArray, Iterator::bestVariablesArray, Dakota::data_pairs, Model::interface_id(), Iterator::iteratedModel, Dakota::lookup_by_val(), Iterator::method_Name, Minimizer::numFunctions, Minimizer::numUserPrimaryFns, Minimizer::optimizationFlag, Minimizer::print_residuals(), ActiveSet::request_values(), Model::truth_model(), and Dakota::write_data_partial().

**void update_lagrange_multipliers ( const RealVector & fn_vals, const RealMatrix & fn_grads, SurrBasedLevelData & tr_data ) [protected]**

initialize and update Lagrange multipliers for basic Lagrangian

For the Rockafellar augmented Lagrangian, simple Lagrange multiplier updates are available which do not require the active constraint gradients. For the basic Lagrangian, Lagrange multipliers are estimated through solution of a nonnegative linear least squares problem.

References Dakota::abort_handler(), Minimizer::bigRealBoundSize, Minimizer::constraintTol, Model::continuous_lower_bounds(), Model::continuous_upper_bounds(), Iterator::iteratedModel, SurrBasedMinimizer::lagrangeMult, Minimizer::numContinuousVars, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, Minimizer::objective_gradient(), SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, Model::primary_response_fn_sense(), and Model::primary_response_fn_weights().

Referenced by SurrBasedLocalMinimizer::hard_convergence_check().
void update_augmented_lagrange_multipliers ( const RealVector & fn_vals )  [protected]

initialize and update the Lagrange multipliers for augmented Lagrangian

For the Rockafellar augmented Lagrangian, simple Lagrange multiplier updates are available which do not require the active constraint gradients. For the basic Lagrangian, Lagrange multipliers are estimated through solution of a nonnegative linear least squares problem.

References SurrBasedMinimizer::augLagrangeMult, SurrBasedMinimizer::betaEta, Minimizer::bigRealBoundSize, SurrBasedMinimizer::etaSequence, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, SurrBasedMinimizer::origNonlinIneqUpperBnds, and SurrBasedMinimizer::penaltyParameter.

Referenced by SurrBasedLocalMinimizer::compute_trust_region_ratio(), SurrBasedLocalMinimizer::hard_convergence_check(), and EffGlobalMinimizer::minimize_surrogates_on_model().

bool update_filter ( SurrBasedLevelData & tr_data, const RealVector & fn_vals )  [protected]

update filter using a new set of function values

Update the paretoFilter with fn_vals if new iterate is non-dominated.

References SurrBasedMinimizer::constraint_violation(), Iterator::iteratedModel, Minimizer::numNonlinearConstraints, Minimizer::objective(), Model::primary_response_fn_sense(), and Model::primary_response_fn_weights().

Referenced by SurrBasedLocalMinimizer::compute_trust_region_ratio().

Real lagrangian_merit ( const RealVector & fn_vals, const BoolDeque & sense, const RealVector & primary_wts, const RealVector & nln_ineq_l_bnds, const RealVector & nln_ineq_u_bnds, const RealVector & nln_eq_tgts )  [protected]

compute a Lagrangian function from a set of function values

The Lagrangian function computation sums the objective function and the Lagrange multiplier terms for inequality/equality constraints. This implementation follows the convention in Vanderplaats with \( g < 0 \) and \( h = 0 \). The bounds/targets passed in may reflect the original constraints or the relaxed constraints.

References Minimizer::bigRealBoundSize, Minimizer::constraintTol, SurrBasedMinimizer::lagrangeMult, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, and Minimizer::objective().

Referenced by SurrBasedLocalMinimizer::approx_subprob_objective_eval(), and SurrBasedLocalMinimizer::compute_trust_region_ratio().

Real augmented_lagrangian_merit ( const RealVector & fn_vals, const BoolDeque & sense, const RealVector & primary_wts, const RealVector & nln_ineq_l_bnds, const RealVector & nln_ineq_u_bnds, const RealVector & nln_eq_tgts )  [protected]

compute an augmented Lagrangian function from a set of function values

The Rockafellar augmented Lagrangian function sums the objective function, Lagrange multiplier terms for inequality/equality constraints, and quadratic penalty terms for inequality/equality constraints. This implementation follows the convention in Vanderplaats with \( g < 0 \) and \( h = 0 \). The bounds/targets passed in may reflect the original constraints or the relaxed constraints.

References SurrBasedMinimizer::augLagrangeMult, Minimizer::bigRealBoundSize, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, Minimizer::objective(), and SurrBasedMinimizer::penaltyParameter.

Referenced by SurrBasedLocalMinimizer::approx_subprob_objective_eval(), SurrBasedLocalMinimizer::compute_trust_region_ratio(), EffGlobalMinimizer::get_best_sample(), and EffGlobalMinimizer::minimize_surrogates_on_model().
Real penalty_merit ( const RealVector & fn_vals, const BoolDeque & sense, const RealVector & primary_wts ) [protected]
compute a penalty function from a set of function values
  The penalty function computation applies a quadratic penalty to any constraint violations and adds this to the objective function(s) \( p = f + r_p \cdot c_v \).
  References SurrBasedMinimizer::constraint_violation(), Minimizer::constraintTol, Minimizer::objective(), and SurrBasedMinimizer::penaltyParameter.
  Referenced by SurrBasedLocalMinimizer::compute_trust_region_ratio().

Real constraint_violation ( const RealVector & fn_vals, const Real & constraint_tol ) [protected]
compute the constraint violation from a set of function values
  Compute the quadratic constraint violation defined as \( c_v = g^+ \cdot h^+ \). This implementation supports equality constraints and 2-sided inequalities. The constraint_tol allows for a small constraint infeasibility (used for penalty methods, but not Lagrangian methods).
  References Minimizer::bigRealBoundSize, Minimizer::numNonlinearEqConstraints, Minimizer::numNonlinearIneqConstraints, Minimizer::numUserPrimaryFns, SurrBasedMinimizer::origNonlinEqTargets, SurrBasedMinimizer::origNonlinIneqLowerBnds, and SurrBasedMinimizer::origNonlinIneqUpperBnds.
  Referenced by SurrBasedLocalMinimizer::compute_trust_region_ratio(), SurrBasedLocalMinimizer::hard_convergence_check(), SurrBasedMinimizer::initialize_filter(), EffGlobalMinimizer::minimize_surrogates_on_model(), SurrBasedMinimizer::penalty_merit(), SurrBasedLocalMinimizer::relax_constraints(), SurrBasedMinimizer::update_filter(), and SurrBasedLocalMinimizer::update_penalty().

13.228 SurrogateModel Class Reference

Base class for surrogate models (DataFitSurrModel and HierarchSurrModel).

Inheritance diagram for SurrogateModel:

```
Model
SurrogateModel
DataFitSurrModel HierarchSurrModel
```

Protected Member Functions

- **SurrogateModel (ProblemDescDB &problem_db)**
  
  constructor
• **SurrogateModel** (ProblemDescDB &problem_db, ParallelLibrary &parallel_lib, const SharedVariablesData &svd, const SharedResponseData &srd, const ActiveSet &set, short corr_type, short output_level)
  
  alternate constructor

• **∼SurrogateModel** ()
  
  destructor

• bool initialize_mapping (ParLevLIter pl_iter)
  
  initialize model mapping, returns true if the variables size has changed

• bool finalize_mapping ()
  
  finalize model mapping, returns true if the variables size has changed

• bool mapping_initialized () const
  
  return mappingInitialized

• Model & subordinate_model ()
  
  return truth_model()

• void surrogate_model_key (unsigned short model_index, unsigned short soln_lev_index)
  
  set the indices that define the active approximation sub-model within surrogate models

• void surrogate_model_key (const UShortArray &key)
  
  set the index pair that defines the active approximation sub-model within surrogate models

• const UShortArray & surrogate_model_key () const
  
  return the indices of the active approximation sub-model within surrogate models

• void truth_model_key (unsigned short model_index, unsigned short soln_lev_index)
  
  set the indices that define the active truth sub-model within surrogate models

• void truth_model_key (const UShortArray &key)
  
  set the index pair that defines the active truth sub-model within surrogate models

• const UShortArray & truth_model_key () const
  
  return the indices of the active truth sub-model within surrogate models

• short surrogate_response_mode () const
  
  return responseMode

• int derived_evaluation_id () const
  
  return the current evaluation id for this Model

• size_t mi_parallel_level_index () const
  
  return miPLIndex

• virtual void asv_split (const ShortArray &orig_asv, ShortArray &actual_asv, ShortArray &approx_asv, bool build_flag)
  
  distributes the incoming orig_asv among actual_asv and approx_asv

• unsigned short surrogate_level_index () const
  
  return the level index from active low fidelity model key

• unsigned short truth_level_index () const
  
  return the level index from active high fidelity model key

• void check_submodel_compatibility (const Model &sub_model)
  
  verify compatibility between SurrogateModel attributes and attributes of the submodel (DataFitSurrModel::actual_Model or HierarchSurrModel::highFidelityModel)

• void check_key (int key1, int key2) const
  
  check for consistency in response map keys
• bool force_rebuild ()
  evaluate whether a rebuild of the approximation should be forced based on changes in the inactive data
• void asv_combine (const ShortArray &actual_asv, const ShortArray &approx_asv, ShortArray &combined_asv)
  reconstitutes a combined_asv from actual_asv and approx_asv
• void response_combine (const Response &actual_response, const Response &approx_response, Response &combined_response)
  overlays actual_response and approx_response to update combined_response
• void aggregate_response (const Response &hf_resp, const Response &lf_resp, Response &agg.resp)
  aggregate \{HF,LF\} response data to create a new response with 2x size

Protected Attributes

• IntSet surrogateFnIndices
  for mixed response sets, this array specifies the response function subset that is approximated
• short responseMode
  an enumeration that controls the response calculation mode in \{DataFit,Hierarch\}SurrModel approximate response computations
• UShortArray surrModelKey
  array of indices that identify the surrogate (e.g., low fidelity) model that is currently active within orderedModels
• UShortArray truthModelKey
  array of indices that identify the truth (e.g., high fidelity) model that is currently active within orderedModels
• short corrType
  type of correction: additive, multiplicative, or combined
• IntToIntMap truthIdMap
  map from actualModel/highFidelityModel evaluation ids to DataFitSurrModel/HierarchSurrModel ids
• IntToIntMap surrIdMap
  map from approxInterface/lowFidelityModel evaluation ids to DataFitSurrModel/HierarchSurrModel ids
• int surrModelEvalCntr
  counter for calls to derived_evaluate()\/derived_evaluate\_nowait(); used to key response maps from SurrogateModels
• IntResponseMap surrResponseMap
  map of surrogate responses returned by derived_synchro\(nized() and derived_synchro\_nowait()
• IntResponseMap cachedApproxRespMap
  map of approximate responses retrieved in derived_synchro\_nowait() that could not be returned since corresponding truth model response portions were still pending.
• IntVariablesMap rawVarsMap
  map of raw continuous variables used by apply\_correction(). Model\::varsList cannot be used for this purpose since it does not contain lower level variables sets from finite differencing.
• size_t approxBuilds
  number of calls to build\_approximation()
• size_t miPLIndex
  the index of the active metaiterator-iterator parallelism level (corresponding to ParallelConfiguration::miPL\_Iters) used at runtime
• RealVector referenceCLBnds
stores a reference copy of active continuous lower bounds when the approximation is built; used to detect when a rebuild is required.

- RealVector referenceCUBnds
  stores a reference copy of active continuous upper bounds when the approximation is built; used to detect when a rebuild is required.

- IntVector referenceDILBnds
  stores a reference copy of active discrete int lower bounds when the approximation is built; used to detect when a rebuild is required.

- IntVector referenceDIUBnds
  stores a reference copy of active discrete int upper bounds when the approximation is built; used to detect when a rebuild is required.

- RealVector referenceDRLBnds
  stores a reference copy of active discrete real lower bounds when the approximation is built; used to detect when a rebuild is required.

- RealVector referenceDRUBnds
  stores a reference copy of active discrete real upper bounds when the approximation is built; used to detect when a rebuild is required.

- RealVector referenceICVars
  stores a reference copy of the inactive continuous variables when the approximation is built using a Distinct view; used to detect when a rebuild is required.

- IntVector referenceIDIVars
  stores a reference copy of the inactive discrete int variables when the approximation is built using a Distinct view; used to detect when a rebuild is required.

- StringMultiArray referenceIDSVars
  stores a reference copy of the inactive discrete string variables when the approximation is built using a Distinct view; used to detect when a rebuild is required.

- RealVector referenceIDRVars
  stores a reference copy of the inactive discrete real variables when the approximation is built using a Distinct view; used to detect when a rebuild is required.

Private Attributes

- Variables truthModelVars
  copy of the truth model variables object used to simplify conversion among differing variable views in force_rebuild()

- Constraints truthModelCons
  copy of the truth model constraints object used to simplify conversion among differing variable views in force_rebuild()

- bool mappingInitialized
  track use of initialize_mapping() and finalize_mapping() due to potential redundancy between IteratorScheduler::run_iterator() and {Analyzer,Minimizer}::initialize_run()

Additional Inherited Members

13.228.1 Detailed Description

Base class for surrogate models (DataFitSurrModel and HierarchSurrModel).

The SurrogateModel class provides common functions to derived classes for computing and applying corrections to approximations.
13.228. **SURROGATEMODEL CLASS REFERENCE**

### 13.228.2 Member Function Documentation

```cpp
int derived_evaluation_id ( ) const [inline], [protected], [virtual]
```

return the current evaluation id for this Model

- return the SurrogateModel evaluation id counter. Due to possibly intermittent use of lower level components, this is not the same as approxInterface, actualModel, or orderedModels evaluation counts, which requires a consistent evaluation rekeying process.

  Reimplemented from Model.

  References SurrogateModel::surrModelEvalCntr.

```cpp
bool force_rebuild ( ) [protected], [virtual]
```

evaluate whether a rebuild of the approximation should be forced based on changes in the inactive data

- This function forces a rebuild of the approximation according to the sub-model variables view, the approximation type, and whether the active approximation bounds or inactive variable values have changed since the last approximation build.

  Reimplemented from Model.

  References Constraints::all_continuous_lower_bounds(), Constraints::all_continuous_upper_bounds(), Variables::all_continuous_variables(), Constraints::all_discrete_int_lower_bounds(), Constraints::all_discrete_int_upper_bounds(), Variables::all_discrete_int_variables(), Constraints::all_discrete_real_lower_bounds(), Constraints::all_discrete_real_upper_bounds(), Variables::all_discrete_real_variables(), Variables::all_discrete_string_variables(), Constraints::continuous_lower_bounds(), Model::continuous_lower_bounds(), Constraints::continuous_upper_bounds(), Model::continuous_upper_bounds(), Variables::continuous_variables(), Constraints::copy(), Variables::copy(), Model::current_variables(), Model::currentVariables, Constraints::discrete_int_lower_bounds(), Model::discrete_int_lower_bounds(), Constraints::discrete_int_upper_bounds(), Model::discrete_int_upper_bounds(), Variables::discrete_int_variables(), Constraints::discrete_real_lower_bounds(), Model::discrete_real_lower_bounds(), Constraints::discrete_real_upper_bounds(), Model::discrete_real_upper_bounds(), Variables::discrete_real_variables(), Variables::discrete_string_variables(), Variables::inactive_continuous_variables(), Variables::inactive_discrete_int_variables(), Variables::inactive_discrete_real_variables(), Variables::inactive_discrete_string_variables(), Constraints::is_null(), Variables::is_null(), Model::is_null(), Model::model_type(), SurrogateModel::referenceCLBnds, SurrogateModel::referenceCUBnds, SurrogateModel::referenceDILBnds, SurrogateModel::referenceDIUBnds, SurrogateModel::referenceDRLBnds, SurrogateModel::referenceDRUBnds, SurrogateModel::referenceICVars, SurrogateModel::referenceIDIVars, SurrogateModel::referenceIDRVars, SurrogateModel::referenceIDSVars, Dakota::strbegins(), Model::subordinate_model(), Model::surrogateType, Model::truth_model(), SurrogateModel::truthModelCons, SurrogateModel::truthModelVars, Model::user_defined_constraints(), Model::userDefinedConstraints, and Variables::view().

  Referenced by HierarchSurrModel::derived_evaluate(), DataFitSurrModel::derived_evaluate(), HierarchSurrModel::derived_evaluate_nowait(), and DataFitSurrModel::derived_evaluate_nowait().

### 13.228.3 Member Data Documentation

```cpp
short responseMode [protected]
```

an enumeration that controls the response calculation mode in {DataFit,Hierarch}SurrModel approximate response computations

  SurrBasedLocalMinimizer toggles this mode since compute_correction() does not back out old corrections.

  Referenced by DataFitSurrModel::active_model_key(), SurrogateModel::asv_split(), HierarchSurrModel::component_parallel_mode(), DataFitSurrModel::declare_sources(), HierarchSurrModel::derived_evaluate(), DataFitSurrModel::derived_evaluate(), HierarchSurrModel::derived_evaluate_nowait(), DataFitSurrModel::derived_evaluate_nowait(),
HierarchSurrModel::derived_set_communicators(), DataFitSurrModel::derived_synchronize(), DataFitSurrModel::derived_synchronize_approx(), HierarchSurrModel::derived_synchronize_combine(), HierarchSurrModel::derived_synchronize_combine_nowait(), DataFitSurrModel::derived_synchronize_nowait(), HierarchSurrModel::derived_synchronize_sequential(), HierarchSurrModel::qoi(), DataFitSurrModel::qoi(), HierarchSurrModel::resize_from_subordinate_model(), HierarchSurrModel::resize_response(), HierarchSurrModel::serve_run(), SurrogateModel::surrogate_response_mode(), HierarchSurrModel::surrogate_response_mode(), DataFitSurrModel::surrogate_response_mode(), SurrogateModel::SurrogateModel(), and HierarchSurrModel::update_from_subordinate_model().

size_t approxBuilds [protected]
number of calls to build_approximation()
used as a flag to automatically build the approximation if one of the derived evaluate functions is called prior to build_approximation().

Referenced by DataFitSurrModel::append_approximation(), DataFitSurrModel::approximation_coefficients(), HierarchSurrModel::build_approximation(), DataFitSurrModel::build_global(), DataFitSurrModel::build_local_multipoint(), HierarchSurrModel::derived_evaluate(), DataFitSurrModel::derived_evaluate(), HierarchSurrModel::derived_evaluate_nowait(), DataFitSurrModel::derived_evaluate_nowait(), HierarchSurrModel::init_model(), DataFitSurrModel::init_model(), DataFitSurrModel::pop_approximation(), DataFitSurrModel::update_approximation(), and DataFitSurrModel::update_from_model().

The documentation for this class was generated from the following files:

\begin{itemize}
  \item spawn a single analysis as part of a function evaluation
\end{itemize}

- void \texttt{spawn\_output\_filter\_to\_shell} (bool \texttt{block\_flag})

\begin{itemize}
  \item spawn the output filter portion of a function evaluation
\end{itemize}

Private Attributes

- IntSet \texttt{sysCallSet}

\begin{itemize}
  \item set of function evaluation id's for active asynchronous system call evaluations
\end{itemize}

- IntShortMap \texttt{failCountMap}

\begin{itemize}
  \item map linking function evaluation id's to number of response read failures
\end{itemize}

Additional Inherited Members

13.229.1 Detailed Description

Derived application interface class which spawns simulation codes using system calls. \texttt{system()} is part of the C API and can be used on both Windows and Unix systems.

13.229.2 Member Function Documentation

\begin{verbatim}
void wait\_local\_evaluations ( PRPQueue & prp\_queue ) [inline], [protected], [virtual]
\end{verbatim}

Check for completion of active async jobs (tracked with sysCallSet). Wait for at least one completion and complete all jobs that have returned. This satisfies a “fairness” principle, in the sense that a completed job will \textit{always} be processed (whereas accepting only a single completion could always accept the same completion - the case of very inexpensive fn. evals. - and starve some servers).

Reimplemented from \texttt{ApplicationInterface}.

References \texttt{ApplicationInterface::completionSet}, and \texttt{SysCallApplicInterface::test\_local\_evaluations()}. 

void test_local_evaluations ( PRPQueue & prp_queue ) [protected], [virtual]

Check for completion of active asynch jobs (tracked with sysCallSet). Make one pass through sysCallSet & complete all jobs that have returned.

Reimplemented from ApplicationInterface.

References Dakota::abort_handler(), Response::active_set(), ApplicationInterface::completionSet, SysCallApplic-Interface::failCountMap, ProcessApplicInterface::fileNameMap, Interface::final_eval_id_tag(), Dakota::lookup_by_eval_id(), ApplicationInterface::manage_failure(), ProcessApplicInterface::read_results_files(), SysCallApplic-Interface::sysCallSet, and SysCallApplicInterface::system_call_file_test().

Referenced by SysCallApplicInterface::wait_local_evaluations().

int synchronous_local_analysis ( int analysis_id ) [inline], [protected], [virtual]

This code provides the derived function used by ApplicationInterface::serve_analyses_synch().

Reimplemented from ApplicationInterface.

References SysCallApplicInterface::spawn_analysis_to_shell().

void init_communicators_checks ( int max_eval_concurrency ) [inline], [protected], [virtual]

No derived interface plug-ins, so perform construct-time checks. However, process init issues as warnings since some contexts (e.g., HierarchSurrModel) initialize more configurations than will be used.

Reimplemented from ApplicationInterface.

References ApplicationInterface::check_multiprocessor_analysis().

void set_communicators_checks ( int max_eval_concurrency ) [inline], [protected], [virtual]

Process run-time issues as hard errors.

Reimplemented from ApplicationInterface.

References Dakota::abort_handler(), and ApplicationInterface::check_multiprocessor_analysis().

void spawn_evaluation_to_shell ( bool block_flag ) [private]

spawn a complete function evaluation

Put the SysCallApplicInterface to the shell. This function is used when all portions of the function evaluation (i.e., all analysis drivers) are executed on the local processor.

References CommandShell::asynch_flag(), ProcessApplicInterface::commandLineArgs, ProcessApplicInterface-::curWorkdir, Dakota::flush(), ProcessApplicInterface::iFilterName, ProcessApplicInterface::multipleParamsFiles, ProcessApplicInterface::oFilterName, ProcessApplicInterface::paramsFileName, ProcessApplicInterface::prepare_process_environment(), ProcessApplicInterface::programNames, ProcessApplicInterface::reset_process_environment(), ProcessApplicInterface::resultsFileName, Dakota::substitute_params_and_results(), CommandShell::suppress_output_flag(), ApplicationInterface::suppressOutput, and ProcessApplicInterface::useWorkdir.

Referenced by SysCallApplicInterface::create_evaluation_process().

void spawn_input_filter_to_shell ( bool block_flag ) [private]

spawn the input filter portion of a function evaluation

Put the input filter to the shell. This function is used when multiple analysis drivers are spread between processors. No need to check for a Null input filter, as this is checked externally. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.
13.230. **TABULARDATATRUNCATED CLASS REFERENCE**

References CommandShell::asynch_flag(), ProcessApplicInterface::commandLineArgs, Dakota::flush(), ProcessApplicInterface::iFilterName, ProcessApplicInterface::paramsFileName, ProcessApplicInterface::prepare_process_environment(), ProcessApplicInterface::reset_process_environment(), ProcessApplicInterface::resultsFileName, Dakota::substitute_params_and_results(), CommandShell::suppress_output_flag(), and ApplicationInterface::suppress_output.

Referenced by SysCallApplicInterface::create_evaluation_process().

```cpp
void spawn_analysis_to_shell ( int analysis_id, bool block_flag ) [private]
```
spawn a single analysis as part of a function evaluation

Put a single analysis to the shell. This function is used when multiple analysis drivers are spread between processors. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

References CommandShell::asynch_flag(), ProcessApplicInterface::commandLineArgs, Dakota::flush(), ProcessApplicInterface::multipleParamsFiles, ProcessApplicInterface::paramsFileName, ProcessApplicInterface::prepare_process_environment(), ProcessApplicInterface::programNames, ProcessApplicInterface::reset_process_environment(), ProcessApplicInterface::resultsFileName, Dakota::substitute_params_and_results(), CommandShell::suppress_output_flag(), and ApplicationInterface::suppress_output.

Referenced by SysCallApplicInterface::create_evaluation_process(), SysCallApplicInterface::synchronous_local_analysis(), and GridApplicInterface::synchronous_local_analysis().

```cpp
void spawn_output_filter_to_shell ( bool block_flag ) [private]
```
spawn the output filter portion of a function evaluation

Put the output filter to the shell. This function is used when multiple analysis drivers are spread between processors. No need to check for a Null output filter, as this is checked externally. Use of nonblocking shells is supported in this fn, although its use is currently prevented externally.

References CommandShell::asynch_flag(), ProcessApplicInterface::commandLineArgs, Dakota::flush(), ProcessApplicInterface::oFilterName, ProcessApplicInterface::paramsFileName, ProcessApplicInterface::prepare_process_environment(), ProcessApplicInterface::reset_process_environment(), ProcessApplicInterface::resultsFileName, Dakota::substitute_params_and_results(), CommandShell::suppress_output_flag(), and ApplicationInterface::suppress_output.

Referenced by SysCallApplicInterface::create_evaluation_process().

The documentation for this class was generated from the following files:

- SysCallApplicInterface.hpp
- SysCallApplicInterface.cpp

### 13.230 TabularDataTruncated Class Reference

exception thrown when data read truncated

Inheritance diagram for TabularDataTruncated:

```
FileReadException
    \|-- TabularDataTruncated
```
Public Member Functions

- **TabularDataTruncated** (const std::string &msg)

### 13.230.1 Detailed Description

Exception thrown when data read truncated

The documentation for this class was generated from the following file:

- dakota_global_defs.hpp

### 13.231 TabularReader Class Reference

Utility used in derived read_core to read values in tabular format.

Public Member Functions

- template<typename ArrayType>
  
  void operator() (std::istream &s, size_t start_index, size_t num_items, ArrayType &array_data, StringMultiArrayView label_array)

### 13.231.1 Detailed Description

Utility used in derived read_core to read values in tabular format.

#### 13.231.2 Member Function Documentation

`void operator() (std::istream &s, size_t start_index, size_t num_items, ArrayType &array_data, StringMultiArrayView label_array)`

The tabular reader doesn't forward the label arrays

References Dakota::read_data_partial_tabular().

The documentation for this class was generated from the following file:

- DakotaVariables.hpp

### 13.232 TabularWriter Class Reference

Utility used in derived write_core to write values in tabular format.

Public Member Functions

- template<typename ArrayType>
  
  void operator() (std::ostream &s, size_t start_index, size_t num_items, const ArrayType &array_data, StringMultiArrayConstView label_array)

### 13.232.1 Detailed Description

Utility used in derived write_core to write values in tabular format.
### 13.232.2 Member Function Documentation

```cpp
default constructor
void operator() (std::ostream &s, size_t start_index, size_t num_items, const ArrayType &array_data, StringMultiArrayConstView label_array) [inline]
```

The tabular writer doesn't forward the label arrays.

References Dakota::write.data_partial_tabular()  
The documentation for this class was generated from the following file:

- DakotaVariables.hpp

### 13.233 TANA3Approximation Class Reference

Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation).

Inheritance diagram for TANA3Approximation:

```
Approximation
```

```
TANA3Approximation
```

#### Public Member Functions

- **TANA3Approximation ()**  
  default constructor
- **TANA3Approximation (ProblemDescDB &problem_db, const SharedApproxData &shared_data, const String &approx_label)**  
  standard constructor
- **TANA3Approximation (const SharedApproxData &shared_data)**  
  alternate constructor
- **~TANA3Approximation ()**  
  destructor

#### Protected Member Functions

- **int min_coefficients () const**  
  return the minimum number of samples (unknowns) required to build the derived class approximation type in num- Vars dimensions
- **void build ()**  
  builds the approximation from scratch
- **Real value (const Variables &vars)**  
  retrieve the approximate function value for a given parameter vector
- **const RealVector & gradient (const Variables &vars)**  
  retrieve the approximate function gradient for a given parameter vector
- **void clear_current_active_data ()**
Private Member Functions

- void find_scaled_coefficients()
  compute TANA coefficients based on scaled inputs
- void offset(const RealVector &x, RealVector &s)
  based on minX, offset original parameters (x) to define positive parameters (s)

Private Attributes

- RealVector pExp
  vector of exponent values
- RealVector minX
  vector of minimum param values used for offset/scaling
- RealVector scX1
  vector of scaled and/or offset x1 values
- RealVector scX2
  vector of scaled and/or offset x2 values
- Real H
  the scalar Hessian value in the TANA-3 approximation

Additional Inherited Members

13.233.1 Detailed Description

Derived approximation class for TANA-3 two-point exponential approximation (a multipoint approximation).

The TANA3Approximation class provides a multipoint approximation based on matching value and gradient
data from two points (typically the current and previous iterates) in parameter space. It forms an exponential
approximation in terms of intervening variables.

13.233.2 Member Function Documentation

void build() [protected], [virtual]
builds the approximation from scratch

This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations
should explicitly invoke (or reimplement) this base class contribution.
Reimplemented from Approximation.
References Dakota::abort_handler(), Approximation::build(), TANA3Approximation::find_scaled_coefficients(),
Dakota::length(), TANA3Approximation::minX, SharedApproxData::numVars, TANA3Approximation::pExp, Approximation-::sharedDataRep, and Approximation::surrogate_data().

void clear_current_active_data() [inline], [protected], [virtual]
Redefine default implementation to support history mechanism.
Reimplemented from Approximation.
References Approximation::approxData, SharedApproxData::approxDataKeys, and Approximation::shared-
DataRep.

The documentation for this class was generated from the following files:
- TANA3Approximation.hpp
- TANA3Approximation.cpp
13.234 TaylorApproximation Class Reference

Derived approximation class for first- or second-order Taylor series (a local approximation).

Inheritance diagram for TaylorApproximation:

```
Approximation
  └── TaylorApproximation
```

Public Member Functions

- `TaylorApproximation()`
  default constructor
- `TaylorApproximation(ProblemDescDB &problem_db, const SharedApproxData &shared_data, const String &approx_label)`
  standard constructor
- `TaylorApproximation(const SharedApproxData &shared_data)`
  alternate constructor
- `~TaylorApproximation()`
  destructor

Protected Member Functions

- `int min_coefficients() const`
  return the minimum number of samples (unknowns) required to build the derived class approximation type in num-Cells dimensions
- `void build()`
  builds the approximation from scratch
- `Real value(const Variables &vars)`
  retrieve the approximate function value for a given parameter vector
- `const RealVector & gradient(const Variables &vars)`
  retrieve the approximate function gradient for a given parameter vector
- `const RealSymMatrix & hessian(const Variables &vars)`
  retrieve the approximate function Hessian for a given parameter vector

Additional Inherited Members

13.234.1 Detailed Description

Derived approximation class for first- or second-order Taylor series (a local approximation).

The TaylorApproximation class provides a local approximation based on data from a single point in parameter space. It uses a zeroth-, first- or second-order Taylor series expansion: f(x) = f(x₀) for zeroth-order, plus grad(x₀)′ (x - x₀) for first- and second-order, and plus (x - x₀)′ Hess(x₀) (x - x₀) / 2 for second-order.
13.234.2 Member Function Documentation

```cpp
void build ( ) [protected], [virtual]
```
builds the approximation from scratch.
This is the common base class portion of the virtual fn and is insufficient on its own; derived implementations should explicitly invoke (or reimplement) this base class contribution.
Reimplemented from Approximation.
References Dakota::abort_handler(), Approximation::build(), SharedApproxData::buildDataOrder, SharedApproxData::numVars, Approximation::sharedDataRep, and Approximation::surrogate_data().
The documentation for this class was generated from the following files:
- TaylorApproximation.hpp
- TaylorApproximation.cpp

13.235 TestDriverInterface Class Reference

Inheritance diagram for TestDriverInterface:
```
  Interface
     |   
  ApplicationInterface
     |   
  DirectApplicInterface
     |   
  TestDriverInterface
```

Public Member Functions
- TestDriverInterface (const ProblemDescDB &problem_db)
  constructor
- ~TestDriverInterface ()
  destructor

Protected Member Functions
- virtual int derived_map_ac (const Dakota::String &ac_name)
  execute an analysis code portion of a direct evaluation invocation

Private Member Functions
- int cantilever ()
  scaled cantilever test function for optimization
- int mod_cantilever ()
  unscaled cantilever test function for UQ
• int cyl_head ()
  the cylinder head constrained optimization test fn
• int multimodal ()
  multimodal UQ test function
• int log_ratio ()
  the log_ratio UQ test function
• int short_column ()
  the short_column UQ/OUU test function
• int lf_short_column ()
  a low fidelity short_column test function
• int mf_short_column ()
  alternate short_column formulations for multifidelity or model form studies
• int alternate_short_column_forms (int form)
  helper fn for alternate forms
• int side_impact_cost ()
  the side_impact_cost UQ/OUU test function
• int side_impact_perf ()
  the side_impact_perf UQ/OUU test function
• int rosenbrock ()
  the Rosenbrock optimization and least squares test fn
• int modified_rosenbrock ()
  the modified Rosenbrock optimization and least squares test fn. The modification is the addition of an \( \sin^2 \) term so that function can not be exactly approximated by a low degree polynomial
• int generalized_rosenbrock ()
  n-dimensional Rosenbrock (Schittkowski)
• int extended_rosenbrock ()
  n-dimensional Rosenbrock (Nocedal/Wright)
• int lf_rosenbrock ()
  a low fidelity version of the Rosenbrock function
• int extra_lf_rosenbrock ()
  an extra low fidelity version of the Rosenbrock function
• int mf_rosenbrock ()
  alternate Rosenbrock formulations for multifidelity or model form studies
• int lf_poly_prod ()
  modified low fidelity Rosenbrock to test SBO with hierarchical approximations
• int poly_prod ()
  modified low fidelity Rosenbrock to test SBO with hierarchical approximations
• int gerstner ()
  the isotropic/anisotropic Gerstner test function family
• int scalable_gerstner ()
  scalable versions of the Gerstner test family
• void get_genz_coefficients (int num_dims, Real factor, int c_type, RealVector &c, RealVector &w)
define coefficients needs for genz model

- int genz ()
  scalable test functions from the Genz test suite
- int damped_oscillator ()
  1d-6d that returns field values (ode solution)
- int steady_state_diffusion_1d ()
  solve the 1d steady-state diffusion eqn < with uncertain field diffusivity
- int transient_diffusion_1d ()
  solve the 1d transient diffusion equation < with uncertain scalar diffusivity
- int predator_prey ()
- int steel_column_cost ()
  solve a predator prey population dynamics model
- int steel_column_perf ()
  the steel_column_perf UQ/OUU test function
- int sobol_rational ()
  Sobol SA rational test function.
- int sobol_g_function ()
  Sobol SA discontinuous test function.
- int sobol_ishigami ()
  Sobol SA transcendental test function.
- int text_book ()
  the text_book constrained optimization test function
- int text_book1 ()
  portion of text_book() evaluating the objective fn
- int text_book2 ()
  portion of text_book() evaluating constraint 1
- int text_book3 ()
  portion of text_book() evaluating constraint 2
- int text_book_ouu ()
  the text_book_ouu OUU test function
- int scalable_text_book ()
  scalable version of the text_book test function
- int scalable_monomials ()
  simple monomials for UQ exactness testing
- int mogastest1 ()
  MOP2 from Van Veldhuizen, pp. 5-13.
- int mogastest2 ()
- int mogastest3 ()
  Srinivas’ from Van Veldhuizen, pp. B-5.
- int illumination ()
  illumination example in Boyd as a general < minimization problem
- int barnes ()
barnes test for SBO performance from Rodriguez, Perez, Renaud, et al.

- **int barnes_lof()**
  
  Lo-fi barnes test for SBO performance

- **void herbie1D(size_t der_mode, Real xc_loc, std::vector<Real>&w_and_ders)**
  
  1D components of herbie function

- **void smooth_herbie1D(size_t der_mode, Real xc_loc, std::vector<Real>&w_and_ders)**
  
  1D components of smooth herbie function

- **void shubert1D(size_t der_mode, Real xc_loc, std::vector<Real>&w_and_ders)**
  
  1D components of shubert function

- **int herbie()**
  
  Returns the N-D herbie function

- **int smooth_herbie()**
  
  Returns the N-D smooth herbie function

- **int shubert()**
  
  Returns the N-D shubert function

- **int bayes_linear()**
  
  Scalable test function for Bayesian methods, to estimate parameters.

- **void separable_combine(Real mult_scale_factor, std::vector<Real>&w, std::vector<Real>&d1w, std::vector<Real>&d2w)**
  
  Utility to combine components of separable fns

- **Real levenshtein_distance(const String &v)**
  
  Compute Levenshtein distance between v and LEV_REF.

- **int salinas()**
  
  Direct interface to the SALINAS structural dynamics code

- **int mc_api_run()**
  
  Direct interface to ModelCenter via API, HKIM 4/3/03

- **int aniso_quad_form()**
  
  1-D function using an anisotropic quadratic < form

### Static Private Attributes

- **static StringRealMap levenshteinDistanceCache**
  
  Cache results of Levenshtein distance calc for efficiency.

### Additional Inherited Members

#### 13.235.1 Detailed Description

Specialization of **DirectApplicInterface** to embed algebraic test function drivers directly in Dakota
13.235.2 Member Function Documentation

```cpp
int derived_map_ac ( const Dakota::String & ac_name ) [protected], [virtual]
```

execute an analysis code portion of a direct evaluation invocation

Derived map to evaluate a particular built-in test analysis function

Reimplemented from DirectApplicInterface.

References Dakota::abort_handler(), ApplicationInterface::analysisServerId, TestDriverInterface::aniso_quad_form(), TestDriverInterface::barnes(), TestDriverInterface::barnes_if(), TestDriverInterface::bayes_linear(), TestDriverInterface::cantilever(), TestDriverInterface::cyl_head(), TestDriverInterface::damped_oscillator(), DirectApplicInterface::driverTypeMap, TestDriverInterface::extended_rosenbrock(), TestDriverInterface::extra_lf_rosenbrock(), TestDriverInterface::generalized_rosenbrock(), TestDriverInterface::genz(), TestDriverInterface::gerstner(), TestDriverInterface::herbie(), TestDriverInterface::illumination(), TestDriverInterface::lf_poly_prod(), TestDriverInterface::lf_rosenbrock(), TestDriverInterface::lf_short_column(), TestDriverInterface::log_ratio(), TestDriverInterface::mc_api_run(), TestDriverInterface::mf_rosenbrock(), TestDriverInterface::mf_short_column(), TestDriverInterface::mod_cantilever(), TestDriverInterface::modified_rosevalbrock(), TestDriverInterface::modified_rosenbrock(), TestDriverInterface::modgatet3(), TestDriverInterface::poly_prod(), TestDriverInterface::poly_rosenbrock(), TestDriverInterface::scalable_monomials(), TestDriverInterface::scalable_gerstner(), TestDriverInterface::scalable_text_book(), TestDriverInterface::short_column(), TestDriverInterface::shubert(), TestDriverInterface::side_impact_cost(), TestDriverInterface::side_impact_perf(), TestDriverInterface::smooth_herbie(), TestDriverInterface::sobol_g_function(), TestDriverInterface::sobol_ishigami(), TestDriverInterface::sobol_rational(), TestDriverInterface::steady_state_diffusion_1d(), TestDriverInterface::steel_column_cost(), TestDriverInterface::steel_column_perf(), TestDriverInterface::text_book1(), TestDriverInterface::text_book2(), TestDriverInterface::text_book3(), TestDriverInterface::text_book_ouu(), and TestDriverInterface::transient_diffusion_1d().

```cpp
int lf_poly_prod ( ) [private]
```

modified low fidelity Rosenbrock to test SBO with < hierarchical approximations

modified lo-fi Rosenbrock to test SBO with hierarchical approximations

```

```c
void herbie1D( size_t der_mode, Real xc_loc, std::vector< Real > & w_and_ders ) [private]

1D components of herbie function

1D Herbie function and its derivatives (apart from a multiplicative factor)

Referenced by TestDriverInterface::herbie().
```
void smooth_herbie1D ( size_t der_mode, Real xc_loc, std::vector<Real> & w_and_ders ) [private]

1D components of smooth_herbie function

1D Smoothed Herbie= 1DHerbie minus the high frequency sine term, and its derivatives (apart from a multiplicative factor)

Referenced by TestDriverInterface::smooth_herbie().

void shubert1D ( size_t der_mode, Real xc_loc, std::vector<Real> & w_and_ders ) [private]

1D components of shubert function

1D Shubert function and its derivatives (apart from a multiplicative factor)

Referenced by TestDriverInterface::shubert().

int herbie ( ) [private]

returns the N-D herbie function

N-D Herbie function and its derivatives.

References DirectApplicInterface::directFnASV, DirectApplicInterface::directFnDVV, TestDriverInterface::herbie1D(), DirectApplicInterface::numDerivVars, DirectApplicInterface::numVars, TestDriverInterface::separable_combine(), and DirectApplicInterface::xC.

Referenced by TestDriverInterface::derived_map_ac().

int smooth_herbie ( ) [private]

returns the N-D smooth herbie function

N-D Smoothed Herbie function and its derivatives.

References DirectApplicInterface::directFnASV, DirectApplicInterface::directFnDVV, DirectApplicInterface::numDerivVars, DirectApplicInterface::numVars, TestDriverInterface::separable_combine(), TestDriverInterface::smooth_herbie1D(), and DirectApplicInterface::xC.

Referenced by TestDriverInterface::derived_map_ac().

void separable_combine ( Real mult_scale_factor, std::vector<Real> & w, std::vector<Real> & d1w, std::vector<Real> & d2w ) [private]

utility to combine components of separable fns

this function combines N 1D functions and their derivatives to compute a N-D separable function and its derivatives, logic is general enough to support different 1D functions in different dimensions (can mix and match)

References DirectApplicInterface::directFnASV, DirectApplicInterface::directFnDVV, DirectApplicInterface::fnGrads, DirectApplicInterface::fnHessians, DirectApplicInterface::fnVals, DirectApplicInterface::numDerivVars, and DirectApplicInterface::numVars.

Referenced by TestDriverInterface::herbie(), TestDriverInterface::shubert(), and TestDriverInterface::smooth_herbie().

Real levenshtein_distance ( const String & v ) [private]

Compute Levenshtein distance between v and LEV_REF.

Levenshtein distance is the number of changes (single character

References Dakota::LEV_REF, and TestDriverInterface::levenshteinDistanceCache.

Referenced by TestDriverInterface::text_book1(), TestDriverInterface::text_book2(), and TestDriverInterface::text_book3().
int mc_api_run( ) [private]

direct interface to ModelCenter via API, HKIM 4/3/03

The ModelCenter interface doesn’t have any specific construct vs. run time functions. For now, we manage it along with the integrated test drivers

References Dakota::abort_handler(), Interface::analysisComponents, DirectApplicInterface::analysisDriverIndex, Dakota::dc_ptr_int, DirectApplicInterface::directFnASV, Interface::fnLabels, DirectApplicInterface::fnVals, Dakota::mc_ptr_int, ApplicationInterface::multiProcAnalysisFlag, DirectApplicInterface::numACV, DirectApplicInterface::numADIV, DirectApplicInterface::numADRV, DirectApplicInterface::numFns, DirectApplicInterface::xC, DirectApplicInterface::xCLabels, DirectApplicInterface::xDI, DirectApplicInterface::xDILabels, DirectApplicInterface::xDRL, and DirectApplicInterface::xDRLLabels.

Referenced by TestDriverInterface::derived_map_ac().

13.236 TKFactoryDIPC Class Reference

Custom RW TKfactory: passes Dakota QUESO instance pointer to the TK at build.
Inherits TransitionKernelFactory.

Public Member Functions

- TKFactoryDIPC (const std::string &name)
  Constructor for Dakota RW transition kernel factory.
- virtual ~TKFactoryDIPC ()
  Destructor for Dakota RW transition kernel factory.
- void set_callback (NonDQUESOBayesCalibration *queso_instance)
  Update the factory’s QUESO callback pointer.

Protected Member Functions

- virtual QUESO::SharedPtr< QUESO::BaseTKGroup>
  < QUESO::GslVector,
  QUESO::GslMatrix > >::Type build_tk () override
  build and return the custom TK

Private Attributes

- NonDQUESOBayesCalibration * nonDQUESOInstance
  pointer for callbacks to Dakota QUESO class
13.236.1 Detailed Description

Custom RW TKfactory: passes Dakota QUESO instance pointer to the TK at build.
Can’t share this factory between random walk and logit as their constructor arguments differ
The documentation for this class was generated from the following file:

- QUESOImpl.hpp

13.237 TKFactoryDIPCLogit Class Reference

Custom Logit RW TKfactory: passed Dakota QUESO instance pointer to the TK at build.
Inherits TransitionKernelFactory.

Public Member Functions

- TKFactoryDIPCLogit (const std::string &name)
  Constructor for Dakota Logit RW transition kernel factory.
- virtual ~TKFactoryDIPCLogit ()
  Destructor for Dakota Logit RW transition kernel factory.
- void set_callback (NonDQUESOBayesCalibration *queso_instance)
  Update the factory’s QUESO callback pointer.

Protected Member Functions

- virtual QUESO::SharedPtr<QUESO::BaseTKGroup<QUESO::GslVector, QUESO::GslMatrix>>::Type build () override
  build and return the custom TK

Private Attributes

- NonDQUESOBayesCalibration * nonDQUESOInstance
  pointer for callbacks to Dakota QUESO class

13.237.1 Detailed Description

Custom Logit RW TKfactory: passed Dakota QUESO instance pointer to the TK at build.
Can’t share this factory between random walk and logit as their constructor arguments differ
The documentation for this class was generated from the following file:

- QUESOImpl.hpp

13.238 TrackerHTTP Class Reference

TrackerHTTP: a usage tracking module that uses HTTP/HTTPS via the curl library.
Classes

- struct Server
  
  struct to hold tracker/proxy pairs

Public Member Functions

- TrackerHTTP()
  
  default constructor is allowed, but doesn’t generate output

- TrackerHTTP(int world_rank=0)
  
  standard constructor with ProblemDescDB, rank

- ~TrackerHTTP()
  
  destructor to free handles

- void post_start(ProblemDescDB &problem_db)
  
  post the start of an analysis and archive start time

- void post_finish(unsigned runtime=0)
  
  post the completion of an analysis including elapsed time

Private Member Functions

- void initialize(int world_rank=0)
  
  shared initialization functions across constructors

- void url_add_field(std::string &url, const char *keyword, const std::string &value, bool delimit=true) const
  
  append keyword/value pair to url in GET style (with &keyword=value); set delimit = false to omit the &

- void build_default_data(std::string &url, std::time_t &rawtime, const std::string &mode) const
  
  construct URL with shared information for start/finish

- void send_data_using_get(const std::string &urltopost) const
  
  transmit data to the web server using GET

- void send_data_using_post(const std::string &datatopost)
  
  POST separate location and query; datatopost = “name=daniel&project=curl”.

- void split_string(const std::string &s, const char &delim, std::vector<std::string> &elems)
  
  Split a string on a delimiter and place tokens in elems.

- void parse_tracking_string(const std::string &dt)
  
  Populate serverList with tracker and proxy URLs from dt.

- void populate_method_list(ProblemDescDB &problem_db)
  
  extract list of methods from problem database

- std::string get_uid() const
  
  get the real user ID

- std::string get_username() const
  
  get the username as reported by the environment

- std::string getHostname() const
  
  get the system hostname

- std::string get_os() const
  
  get the operating system

- std::string get_datetime(const std::time_t &rawtime) const
  
  get the date and time as a string YYYYMMDDHHMMSS
Private Attributes

- **CURL** * curlPtr
  pointer to the curl handler instance
- **FILE** * devNull
  pointer to /dev/null
- **std::list< Server >** serverList
  List of servers to try (tracker and proxy)
- **long** timeoutSeconds
  seconds until the request will timeout (may have issues with signals)
- **std::string** methodList
  list of active methods
- **std::string** dakotaVersion
  DAKOTA version.
- **std::time_t** startTime
  cached starting time in raw seconds
- **short** outputLevel
  verbosity control

13.238.1 Detailed Description

TrackerHTTP: a usage tracking module that uses HTTP/HTTPS via the curl library.

13.238.2 Member Function Documentation

```cpp
void send_data_using_get ( const std::string & urltopost ) const [private]
```
transmit data to the web server using GET
whole url including location&fields
References TrackerHTTP::curlPtr, and TrackerHTTP::outputLevel.

```cpp
void send_data_using_post ( const std::string & datatopost ) [private]
```
POST separate location and query; datatopost="name=daniel&project(curl"
separate location and query; datatopost="name=daniel&project=curl"
References TrackerHTTP::curlPtr, TrackerHTTP::outputLevel, and TrackerHTTP::serverList.
Referenced by TrackerHTTP::post_finish(), and TrackerHTTP::post_start().
The documentation for this class was generated from the following files:

- TrackerHTTP.hpp
- TrackerHTTP.cpp
13.239  TraitsBase Class Reference

Base class for traits.

Inheritance diagram for TraitsBase:

Public Member Functions

- **TraitsBase ()**
  
  *default constructor*

- **virtual ~TraitsBase ()**
  
  *destructor*

- **virtual bool is_derived ()**
  
  *A temporary query used in the refactor.*

- **virtual bool requires_bounds ()**
  
  *Return the flag indicating whether method requires bounds.*

- **virtual bool supports_linear_equality ()**
  
  *Return the flag indicating whether method supports linear equalities.*

- **virtual bool supports_linear_inequality ()**

Return the flag indicating whether method supports linear inequalities.
• virtual LINEAR_INEQUALITY_FORMAT linear_inequality_format ()
  Return the format used for linear inequality constraints.
• virtual bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear equalities.
• virtual NONLINEAR_EQUALITY_FORMAT nonlinear_inequality_format ()
  Return the format used for nonlinear inequality constraints.
• virtual bool supports_nonlinear_inequality ()
  Return the flag indicating whether method supports nonlinear inequalities.
• virtual NONLINEAR_INEQUALITY_FORMAT nonlinear_inequality_format ()
  Return the format used for nonlinear inequality constraints.
• virtual bool expects_nonlinear_inequalities_first ()
  Return the flag indicating whether method expects nonlinear inequality constraints followed by nonlinear equality constraints.
• virtual bool supports_scaling ()
  Return the flag indicating whether method supports parameter scaling.
• virtual bool supports_least_squares ()
  Return the flag indicating whether method supports least squares.
• virtual bool supports_multiobjectives ()
  Return flag indicating whether method supports multiobjective optimization.
• virtual bool supports_continuous_variables ()
  Return the flag indicating whether method supports continuous variables.
• virtual bool supports_discrete_variables ()
  Return the flag indicating whether method supports discrete variables.
• virtual bool provides_best_objective ()
  Return the flag indicating whether method provides best objective result.
• virtual bool provides_best_parameters ()
  Return the flag indicating whether method provides best parameters result.
• virtual bool provides_best_constraint ()
  Return the flag indicating whether method provides best constraint result.
• virtual bool provides_final_gradient ()
  Return the flag indicating whether method provides final gradient result.
• virtual bool provides_final_hessian ()
  Return the flag indicating whether method provides final hessian result.

13.239.1 Detailed Description

Base class for traits.

TraitsBase provides default traits through various accessors.
The documentation for this class was generated from the following files:

• DakotaTraitsBase.hpp
• DakotaTraitsBase.cpp
13.240  UsageTracker Class Reference

Lightweight class to manage conditionally active Curl-based HTTP tracker via PIMPL.

Public Member Functions

- **UsageTracker ()**
  default construction: no output

- **UsageTracker (int world_rank)**
  standard constructor; will output on rank 0

- **void post_start (ProblemDescDB &problem_db)**
  post the start of an analysis and archive start time

- **void post_finish (unsigned runtime=0)**
  post the completion of an analysis including elapsed time

Private Member Functions

- **UsageTracker (const UsageTracker &)**
  copy construction is disallowed

Private Attributes

- **std::shared_ptr< TrackerHTTP > pTrackerHTTP**
  posts usage data to Web server; using shared_ptr due to potentially incomplete type and requirements for checked_delete in debug builds (scoped_ptr would suffice)

13.240.1  Detailed Description

Lightweight class to manage conditionally active Curl-based HTTP tracker via PIMPL.

All conditional compilation in managed in the cpp file; all operations are no-op in this wrapper if not enabling tracking...

13.240.2  Constructor & Destructor Documentation

UsageTracker ( int world_rank )

standard constructor; will output on rank 0

standard constructor; will output on rank 0 and only initializes if tracking compiled in and not disable by environment

References UsageTracker::pTrackerHTTP.

The documentation for this class was generated from the following files:

- UsageTracker.hpp
- UsageTracker.cpp

13.241  Var_icolck Struct Reference

structure for verifying bounds and initial point for string-valued vars
Public Attributes

- const char * name
- size_t DataVariablesRep::* n
- void(* vgen )(DataVariablesRep *, size_t)
- IntVector DataVariablesRep::* L
- IntVector DataVariablesRep::* U
- IntVector DataVariablesRep::* V
- StringArray DataVariablesRep::* Lbl

13.241.1 Detailed Description
structure for verifying bounds and initial point for string-valued vars
structure for verifying bounds and initial point for integer-valued vars
The documentation for this struct was generated from the following file:

- NIDRProblemDescDB.cpp

13.242 Var_rcheck Struct Reference
structure for verifying bounds and initial point for real-valued vars

Public Attributes

- const char * name
- size_t DataVariablesRep::* n
- void(* vgen )(DataVariablesRep *, size_t)
- RealVector DataVariablesRep::* L
- RealVector DataVariablesRep::* U
- RealVector DataVariablesRep::* V
- StringArray DataVariablesRep::* Lbl

13.242.1 Detailed Description
structure for verifying bounds and initial point for real-valued vars
The documentation for this struct was generated from the following file:

- NIDRProblemDescDB.cpp

13.243 Variables Class Reference
Base class for the variables class hierarchy.
Inheritance diagram for Variables:
Public Member Functions

- **Variables ()**
  default constructor
- **Variables (const ProblemDescDB &problem, db)**
  standard constructor (explicit disallows its use for implicit type conversion)
- **Variables (const SharedVariablesData &svd)**
  alternate constructor for instantiations on the fly (explicit disallows its use for implicit type conversion)
- **Variables (const Variables &vars)**
  copy constructor
- virtual ~Variables ()
  destructor
- **Variables operator= (const Variables &vars)**
  assignment operator
- virtual void read (std::istream &s)
  read a variables object from an std::istream
- virtual void write (std::ostream &s, unsigned short vars_part=ALL_VARS) const
  write a variables object to an std::ostream, e.g., the console, optionally specifying which partition (all/active/inactive)
- virtual void write_aprepro (std::ostream &s) const
  write a variables object to an std::ostream in aprepro format, e.g., a parameters file
- virtual void write.annotated (std::ostream &s)
  write a variables object in annotated format from an istream
- virtual void write.annotated (std::ostream &s) const
  write a variables object in annotated format to an std::ostream
- virtual void read.tabular (std::istream &s, unsigned short vars_part=ALL_VARS)
  read a variables object in tabular format from an istream, optionally specifying which partition (all/active/inactive)
- virtual void write.tabular (std::ostream &s, unsigned short vars_part=ALL_VARS) const
  write a variables object in tabular format to an std::ostream, optionally specifying which partition (all/active/inactive)
- virtual void write.tabular_labels (std::ostream &s, unsigned short vars_part=ALL_VARS) const
  write the labels in input spec order to a std::ostream, optionally specifying which partition (all/active/inactive)
- virtual void read (MPIUnpackBuffer &s)
  read a variables object from a packed MPI buffer
- virtual void write (MPIPackBuffer &s) const
  write a variables object to a packed MPI buffer
- size_t tv () const
  total number of vars
- size_t cv () const
  number of active continuous vars
- size_t cv_start () const
  start index of active continuous vars
- size_t div () const
  number of active discrete int vars
- size_t div_start () const
start index of active discrete int vars

• size_t dsv () const
  number of active discrete string vars

• size_t dsv_start () const
  start index of active discrete string vars

• size_t drv () const
  number of active discrete real vars

• size_t drv_start () const
  start index of active discrete real vars

• size_t icv () const
  number of inactive continuous vars

• size_t icv_start () const
  start index of inactive continuous vars

• size_t idiv () const
  number of inactive discrete int vars

• size_t idiv_start () const
  start index of inactive discrete int vars

• size_t idsv () const
  number of inactive discrete string vars

• size_t idsv_start () const
  start index of inactive discrete string vars

• size_t idrv () const
  number of inactive discrete real vars

• size_t idrv_start () const
  start index of inactive discrete real vars

• size_t acv () const
  total number of continuous vars

• size_t adiv () const
  total number of discrete integer vars

• size_t adsv () const
  total number of discrete string vars

• size_t adrv () const
  total number of discrete real vars

• const SharedVariablesData & shared_data () const
  return sharedVarsData

• SharedVariablesData & shared_data ()
  return sharedVarsData

• void shape ()
  shape a Variables object based on sharedVarsData

• void reshape ()
  reshape an existing Variables object based on updated sharedVarsData

• Real continuous_variable (size_t index) const
  return an active continuous variable
• const RealVector & continuous_variables () const
  return the active continuous variables (Note: returns a view by const reference, but initializing a RealVector from
  this reference invokes the Teuchos matrix copy constructor to create a Teuchos::Copy instance; to obtain a mutable
  view, use continuous_variables_view())
• void continuous_variable (Real c_var, size_t index)
  set an active continuous variable
• void continuous_variables (const RealVector &c_vars)
  set the active continuous variables
• int discrete_int_variable (size_t index) const
  return an active discrete integer variable
• const IntVector & discrete_int_variables () const
  return the active discrete integer variables (Note: returns a view by const reference, but initializing an IntVector
  from this reference invokes the Teuchos matrix copy constructor to create a Teuchos::Copy instance; to obtain a
  mutable view, use discrete_int_variables_view())
• void discrete_int_variable (int di_var, size_t index)
  set an active discrete integer variable
• void discrete_int_variables (const IntVector &di_vars)
  set the active discrete integer variables
• const String & discrete_string_variable (size_t index) const
  return an active discrete string variable
• StringMultiArrayConstView discrete_string_variables () const
  return the active discrete string variables (Note: returns a view by const reference, but initializing a StringArray
  from this reference invokes the Teuchos matrix copy constructor to create a Teuchos::Copy instance; to obtain a
  mutable view, use discrete_string_variables_view())
• void discrete_string_variable (const String &ds_var, size_t index)
  set an active discrete string variable
• void discrete_string_variables (StringMultiArrayConstView ds_vars)
  set the active discrete string variables
• Real discrete_real_variable (size_t index) const
  return an active discrete real variable
• const RealVector & discrete_real_variables () const
  return the active discrete real variables (Note: returns a view by const reference, but initializing a RealVector from
  this reference invokes the Teuchos matrix copy constructor to create a Teuchos::Copy instance; to obtain a mutable
  view, use discrete_real_variables_view())
• void discrete_real_variable (Real dr_var, size_t index)
  set an active discrete real variable
• void discrete_real_variables (const RealVector &dr_vars)
  set the active discrete real variables
• void active_variables (const Variables &vars)
  copy the active cv/div/dsv/drv variables from vars
• void all_variables (const Variables &vars)
  copy all cv/div/dsv/drv variables from vars
• RealVector & continuous_variables_view ()
  return a mutable view of the active continuous variables
• IntVector & discrete_int_variables_view ()
return a mutable view of the active discrete integer variables

- StringMultiArrayView `discrete_string_variables_view()`
  return a mutable view of the active discrete string variables

- RealVector & `discrete_real_variables_view()`
  return a mutable view of the active discrete real variables

- StringMultiArrayConstView `continuous_variable_labels()` const
  return the active continuous variable labels

- void `continuous_variable_labels(StringMultiArrayConstView cv_labels)`
  set the active continuous variable labels

- void `continuous_variable_label(const String &cv_label, size_t index)`
  set an active continuous variable label

- StringMultiArrayConstView `discrete_int_variable_labels()` const
  return the active discrete integer variable labels

- void `discrete_int_variable_labels(StringMultiArrayConstView div_labels)`
  set the active discrete integer variable labels

- void `discrete_int_variable_label(const String &div_label, size_t index)`
  set an active discrete integer variable label

- StringMultiArrayConstView `discrete_string_variable_labels()` const
  return the active discrete string variable labels

- void `discrete_string_variable_labels(StringMultiArrayConstView dsv_labels)`
  set the active discrete string variable labels

- void `discrete_string_variable_label(const String &dsv_label, size_t index)`
  set an active discrete string variable label

- StringMultiArrayConstView `discrete_real_variable_labels()` const
  return the active discrete real variable labels

- void `discrete_real_variable_labels(StringMultiArrayConstView drv_labels)`
  set the active discrete real variable labels

- void `discrete_real_variable_label(const String &drv_label, size_t index)`
  set an active discrete real variable label

- UShortMultiArrayConstView `continuous_variable_types()` const
  return the active continuous variable types

- void `continuous_variable_types(UShortMultiArrayConstView cv_types)`
  set the active continuous variable types

- void `continuous_variable_type(unsigned short cv_type, size_t index)`
  set an active continuous variable type

- UShortMultiArrayConstView `discrete_int_variable_types()` const
  return the active discrete integer variable types

- void `discrete_int_variable_types(UShortMultiArrayConstView div_types)`
  set the active discrete integer variable types

- void `discrete_int_variable_type(unsigned short div_type, size_t index)`
  set an active discrete integer variable type

- UShortMultiArrayConstView `discrete_string_variable_types()` const
  return the active discrete string variable types
• void discrete_string_variable_types (UShortMultiArrayConstView dsv_types)
  set the active discrete string variable types
• void discrete_string_variable_type (unsigned short dsv_type, size_t index)
  set an active discrete string variable type
• UShortMultiArrayConstView discrete_real_variable_types () const
  return the active discrete real variable types
• void discrete_real_variable_types (UShortMultiArrayConstView drv_types)
• void discrete_real_variable_type (unsigned short drv_type, size_t index)
  set an active discrete real variable types
• UShortMultiArrayConstView continuous_variable_ids () const
  return the active continuous variable position identifiers
• void continuous_variable_ids (SizetMultiArrayConstView cv_ids)
  set the active continuous variable position identifiers
• void continuous_variable_id (size_t cv_id, size_t index)
  set an active continuous variable position identifier
• const RealVector & inactive_continuous_variables () const
  return the inactive continuous variables
• void inactive_continuous_variables (const RealVector &ic_vars)
  set the inactive continuous variables
• void inactive_continuous_variable (Real ic_var, size_t index)
  set an inactive continuous variable
• const IntVector & inactive_discrete_int_variables () const
  return the inactive discrete int variables
• void inactive_discrete_int_variables (const IntVector &idi_vars)
  set the inactive discrete int variables
• void inactive_discrete_int_variable (int idi_var, size_t index)
  set an inactive discrete int variable
• StringMultiArrayConstView inactive_discrete_string_variables () const
  return the inactive discrete string variables
• void inactive_discrete_string_variables (StringMultiArrayConstView ids_vars)
  set the inactive discrete string variables
• void inactive_discrete_string_variable (const String &ids_var, size_t index)
  set an inactive discrete string variable
• const RealVector & inactive_discrete_real_variables () const
  return the inactive discrete real variables
• void inactive_discrete_real_variables (const RealVector &idr_vars)
  set the inactive discrete real variables
• void inactive_discrete_real_variable (Real idr_var, size_t index)
  set an inactive discrete real variable
• StringMultiArrayConstView inactive_continuous_variable_labels () const
  return the inactive continuous variable labels
• void inactive_continuous_variable_labels (StringMultiArrayConstView ic_vars)
set the inactive continuous variable labels

- `StringMultiArrayConstView inactive_discrete_int_variable_labels () const`
  return the inactive discrete variable labels
- `void inactive_discrete_int_variable_labels (StringMultiArrayConstView idi_vars)`
  set the inactive discrete variable labels
- `StringMultiArrayConstView inactive_discrete_string_variable_labels () const`
  return the inactive discrete variable labels
- `void inactive_discrete_string_variable_labels (StringMultiArrayConstView ids_vars)`
  set the inactive discrete variable labels
- `StringMultiArrayConstView inactive_discrete_real_variable_labels () const`
  return the inactive discrete variable labels
- `void inactive_discrete_real_variable_labels (StringMultiArrayConstView idr_vars)`
  set the inactive discrete variable labels
- `UShortMultiArrayConstView inactive_continuous_variable_types () const`
  return the inactive continuous variable types
- `UShortMultiArrayConstView inactive_discrete_int_variable_types () const`
  return the inactive discrete integer variable types
- `UShortMultiArrayConstView inactive_discrete_string_variable_types () const`
  return the inactive discrete string variable types
- `UShortMultiArrayConstView inactive_discrete_real_variable_types () const`
  return the inactive discrete real variable types
- `SizetMultiArrayConstView inactive_continuous_variable_ids () const`
  return the inactive continuous variable position identifiers
- `const RealVector & all_continuous_variables () const`
  returns a single array with all continuous variables
- `void all_continuous_variables (const RealVector &ac_vars)`
  sets all continuous variables using a single array
- `void all_continuous_variable (Real ac_var, size_t index)`
  set a variable within the all continuous array
- `const IntVector & all_discrete_int_variables () const`
  returns a single array with all discrete variables
- `void all_discrete_int_variables (const IntVector &adi_vars)`
  sets all discrete variables using a single array
- `void all_discrete_int_variable (int adi_var, size_t index)`
  set a variable within the all discrete array
- `StringMultiArrayConstView all_discrete_string_variables () const`
  returns a single array with all discrete variables
- `void all_discrete_string_variables (StringMultiArrayConstView ads_vars)`
  sets all discrete variables using a single array
- `void all_discrete_string_variable (const String &ads_var, size_t index)`
  set a variable within the all discrete array
- `const RealVector & all_discrete_real_variables () const`
  returns a single array with all discrete variables
• void all_discrete_real_variables (const RealVector &adr_vars)  
  sets all discrete variables using a single array
• void all_discrete_real_variable (Real adr_var, size_t index)  
  set a variable within the all discrete array
• void as_vector (const StringSetArray &dss_vals, RealVector &var_values) const  
  get the active variables as a vector of reals, converting string values to zero-based set indices
• StringMultiArrayView all_continuous_variable_labels () const  
  returns a single array with all continuous variable labels
• void all_continuous_variable_labels (StringMultiArrayConstView acv_labels)  
  sets all continuous variable labels using a single array
• void all_continuous_variable_label (const String &acv_label, size_t index)  
  set a label within the all continuous label array
• StringMultiArrayView all_discrete_int_variable_labels () const  
  returns a single array with all discrete variable labels
• void all_discrete_int_variable_labels (StringMultiArrayConstView adiv_labels)  
  sets all discrete variable labels using a single array
• void all_discrete_int_variable_label (const String &adiv_label, size_t index)  
  set a label within the all discrete label array
• StringMultiArrayView all_discrete_string_variable_labels () const  
  returns a single array with all discrete variable labels
• void all_discrete_string_variable_labels (StringMultiArrayConstView adsv_labels)  
  sets all discrete variable labels using a single array
• void all_discrete_string_variable_label (const String &adsv_label, size_t index)  
  set a label within the all discrete label array
• UShortMultiArrayConstView all_continuous_variable_types () const  
  return all continuous variable types
• UShortMultiArrayConstView all_discrete_int_variable_types () const  
  return all discrete variable types
• UShortMultiArrayConstView all_discrete_string_variable_types () const  
  return all discrete variable types
• UShortMultiArrayConstView all_discrete_real_variable_types () const  
  return all discrete variable types
• SizetMultiArrayConstView all_continuous_variable_ids () const  
  return all continuous variable position identifiers
• SizetMultiArrayConstView all_discrete_int_variable_ids () const  
  return all discrete integer variable position identifiers
• SizetMultiArrayConstView all_discrete_string_variable_ids () const
return all discrete string variable position identifiers

- SizetMultiArrayConstView all_discrete_real_variable_jds () const
  return all discrete real variable position identifiers

- Variables copy (bool deep_svd=false) const
  a deep variables copy for use in history mechanisms (SharedVariablesData uses a shallow copy by default)

- const std::pair< short, short > & view () const
  returns variablesView

- std::pair< short, short > get_view (const ProblemDescDB &problem_db) const
  defines variablesView from problem_db attributes

- void inactive_view (short view2)
  sets the inactive view based on higher level (nested) context

- const String & variables_id () const
  returns the variables identifier string

- const SizetArray & variables_components_totals () const
  returns the number of variables for each of the constitutive components

- bool is_null () const
  function to check variablesRep (does this envelope contain a letter)

Protected Member Functions

- Variables (BaseConstructor, const ProblemDescDB &problem_db, const std::pair< short, short > &view)
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- Variables (BaseConstructor, const SharedVariablesData &svd)
  constructor initializes the base class part of letter classes (BaseConstructor overloading avoids infinite recursion in the derived class constructors - Coplien, p. 139)

- void build_views ()
  construct active/inactive views of all variables arrays

- void build_active_views ()
  construct active views of all variables arrays

- void build_inactive_views ()
  construct inactive views of all variables arrays

Protected Attributes

- SharedVariablesData sharedVarsData
  reference-counted instance of shared variables data: id’s, labels, counts

- RealVector allContinuousVars
  array combining all of the continuous variables

- IntVector allDiscreteIntVars
  array combining all of the discrete integer variables

- StringMultiArray allDiscreteStringVars
  array combining all of the discrete string variables

- RealVector allDiscreteRealVars
array combining all of the discrete real variables

- **RealVector** `continuousVars`  
  the active continuous variables array view

- **IntVector** `discreteIntVars`  
  the active discrete integer variables array view

- **RealVector** `discreteRealVars`  
  the active discrete real variables array view

- **RealVector** `inactiveContinuousVars`  
  the inactive continuous variables array view

- **IntVector** `inactiveDiscreteIntVars`  
  the inactive discrete integer variables array view

- **RealVector** `inactiveDiscreteRealVars`  
  the inactive discrete real variables array view

### Private Member Functions

- **Variables** `* get_variables` (const ProblemDescDB &problem_db)  
  Used by the standard envelope constructor to instantiate the correct letter class.

- **Variables** `* get_variables` (const SharedVariablesData &svd) const  
  Used by the alternate envelope constructors, by read functions, and by `copy()` to instantiate a new letter class.

- **short method** `map` (short view_spec, bool relaxed) const  
  infer domain from method selection

- **short method** `domain` (const ProblemDescDB &problem_db) const  
  infer domain from method selection

- **short method** `view` (const ProblemDescDB &problem_db) const  
  infer view from method selection

- **short method** `response_view` (const ProblemDescDB &problem_db) const  
  infer view from type of response data set

- **void** `check_view_compatibility` ()  
  perform sanity checks on view.first and view.second after update

- **template<class Archive>**  
  void `load` (Archive &ar, const unsigned int version)  
  read a `Variables` object from an archive

- **template<class Archive>**  
  void `save` (Archive &ar, const unsigned int version) const  
  write a `Variables` object to an archive

- **BOOST_SERIALIZATION_SPLIT_MEMBER ()**  
  `Variables` `*variablesRep`  
  pointer to the letter (initialized only for the envelope)

### Private Attributes

- **int** `referenceCount`  
  number of objects sharing `variablesRep`
Friends

- class boost::serialization::access
  for serializing private data members

- bool operator== (const Variables &vars1, const Variables &vars2)
  strict equality operator (for boost hash-based lookups)

- bool operator!= (const Variables &vars1, const Variables &vars2)
  strict inequality operator

- bool nearby (const Variables &vars1, const Variables &vars2, Real rel_tol)
  tolerance-based equality operator

- std::size_t hash_value (const Variables &vars)
  hash_value

13.243.1 Detailed Description

Base class for the variables class hierarchy.

The Variables class is the base class for the class hierarchy providing design, uncertain, and state variables for continuous and discrete domains within a Model. Using the fundamental arrays from the input specification, different derived classes define different views of the data. For memory efficiency and enhanced polymorphism, the variables hierarchy employs the "letter/envelope idiom" (see Coplien "Advanced C++", p. 133), for which the base class (Variables) serves as the envelope and one of the derived classes (selected in Variables::get_variables()) serves as the letter.

13.243.2 Member Function Documentation

StringMultiArrayView discrete_string_variables_view ( ) [inline]

return a mutable view of the active discrete string variables
same as discrete_string_variables(), except mutable view
References Variables::allDiscreteStringVars, SharedVariablesData::dsv(), SharedVariablesData::dsv_start(), and Variables::sharedVarsData.
  The documentation for this class was generated from the following file:

- DakotaVariables.hpp

13.244 Verification Class Reference

Base class for managing common aspects of verification studies.

Inheritance diagram for Verification:
Public Member Functions

- bool resize ()
  reinitializes iterator based on new variable size

Protected Member Functions

- Verification (ProblemDescDB &problem_db, Model &model)
  constructor
- Verification (unsigned short method_name, Model &model)
  alternate constructor for instantiations "on the fly"
- ~Verification ()
  destructor
- void print_results (std::ostream &s, short results_state=FINAL_RESULTS)
  print the final iterator results

Additional Inherited Members

13.244.1 Detailed Description

Base class for managing common aspects of verification studies.

The Verification base class manages common data and functions, such as those involving ...

13.244.2 Member Function Documentation

void print_results ( std::ostream & s, short results_state = FINAL_RESULTS ) [protected], [virtual]
print the final iterator results

This virtual function provides additional iterator-specific final results outputs beyond the function evaluation summary printed in finalize_run().
Reimplemented from Analyzer.
Reimplemented in RichExtrapVerification.
References Analyzer::print_results().
Referenced by RichExtrapVerification::print_results().
The documentation for this class was generated from the following files:

- DakotaVerification.hpp
- DakotaVerification.cpp

void plot_neighbors ()

Protected Member Functions

int min_coefficients () const
return the minimum number of samples (unknowns) required to build the derived class approximation type in num vars dimensions
void build ()
built the approximation from scratch
Real value (const Variables &vars)
retrieve the predicted function value for a given parameter set
const RealVector &gradient (const Variables &vars)
retrieve the function gradient at the predicted value for a given parameter set
Real prediction_variance (const Variables &vars)
retrieve the variance of the predicted value for a given parameter set

Private Types

enum subsurrogate { LS, GP }
enum subsurrogate_basis { polynomial, radial }
enum testfunction {
    SmoothHerbie, Herbie, Cone, Cross,
    UnitSphere, Linear34 }
Private Member Functions

- void VPSmodel_build ()
  
  Function to compute coefficients governing the VPS surrogates.
- void VPSmodel_apply (const RealVector &new_x, bool variance_flag, bool gradients_flag)
  
  Function returns a response value using the VPS surface.

Private Attributes

- Real approxValue
  
  value of the approximation returned by value()
- Real approxVariance
  
  value of the approximation returned by prediction_variance()
- RealMatrix trainPoints
  
  A 2-D array (num sample sites = rows, num vars = columns) used to create the Gaussian process.
- RealMatrix trainValues
  
  An array of response values; one response value per sample site.
- size_t numObs
  
  The number of observations on which the GP surface is built.
- int surrogateOrder
  
  The order of the polynomial in each Voronoi cell.
- subsurrogate _vps_subsurrogate
- subsurrogate_basis _vps_subsurrogate_basis
- testfunction _vps_test_function
- double Q [1220]
- int indx
- double cc
- double c
- double zc
- double zx
- double zy
- size_t qlen
- size_t _n_dim
- double * _xmin
- double * _xmax
- double _diag
- size_t _num_inserted_points
- double ** _sample_points
- double * _fval
- double ** _fgrad
- double *** _fhess

- size_t ** _vps_ext_neighbors
- size_t _vps_order
- size_t _num_GMRES
- size_t * _num_cell_basis_functions
Static Private Attributes

- static VPSApproximation * VPSinstance
  pointer to the active object instance used within the static evaluator

Additional Inherited Members

13.248.1 Detailed Description

Derived approximation class for VPS implementation.

The VPSApproximation class provides a set of piecewise surrogate approximations each of which is valid within a Voronoi cell.

13.248.2 Member Function Documentation

void VPSmodel_apply ( const RealVector & new_x, bool variance_flag, bool gradients_flag ) [private]

Function returns a response value using the VPS surface.

  The response value is computed at the design point specified by the RealVector function argument.
  References VPSApproximation::approxValue.
  Referenced by VPSApproximation::gradient(), VPSApproximation::prediction_variance(), and VPSApproximation::value().

13.248.3 Member Data Documentation

VPSApproximation * VPSinstance [static], [private]

pointer to the active object instance used within the static evaluator default constructor

The documentation for this class was generated from the following files:

- VPSApproximation.hpp
- VPSApproximation.cpp
13.249  WeightingModel Class Reference

Weighting specialization of RecastModel.

Inheritance diagram for WeightingModel:

```
  Model
   |
   v
RecastModel
   |
   v
WeightingModel
```

Public Member Functions

- `WeightingModel (Model &sub_model)`
  
  *standard constructor*

- `~WeightingModel ()`
  
  *destructor*

Static Protected Member Functions

- `static void primary_resp_weighter (const Variables &sub_model_vars, const Variables &recast_vars, const Response &sub_model_response, Response &weighted_response)`

- `static void primary_resp_unweighter (const Variables &recast_vars, const Variables &sub_model_vars, const Response &weighted_resp, Response &unweighted_resp)=delete`

Static Private Attributes

- `static WeightingModel * weightModelInstance [static], [private]`
  
  *static pointer to this class for use in static callbacks*

Additional Inherited Members

13.249.1  Detailed Description

Weighting specialization of RecastModel.

Specialization of a RecastModel that manages Response weighting (could be implemented as special case of ScalingModel, but kept separate for simplicity for now). This class provides a simple constructor that forwards to the more complicated RecastModel API

13.249.2  Member Data Documentation

`WeightingModel * weightModelInstance [static], [private]`

*static pointer to this class for use in static callbacks*

Initialization of static needed by RecastModel

Referenced by WeightingModel::WeightingModel().

The documentation for this class was generated from the following files:
13.250 WorkdirHelper Class Reference

Static Public Member Functions

- static void initialize ()
  initialize (at runtime) cached values for paths and environment
- static const std::string & startup_pwd ()
  Query for dakota’s startup $PWD.
- static void change_directory (const bfs::path &new_dir)
  change current directory
- static void prepend_preferred_env_path (const std::string &extra_path)
  Prepend cached preferredEnvPath with extra_path and update $PATH environment variable.
- static void set_environment (const std::string &env_name, const std::string &env_val, bool overwrite_flag=true)
  Set an environment variable.
- static bfs::path which (const std::string &driver_name)
  Returns the bfs::path for the analysis driver, supporting typical windows filename extensions, or empty if not found.
- static bfs::path rel_to_abs (const bfs::path &subdir_path)
  get a valid absolute bfs::path to a subdirectory relative to rundir
- static StringArray tokenize_driver (const String &user_an_driver)
  tokenize a white-space separated analysis driver, respecting escapes and nested quotes
- static bool resolve_driver_path (String &an_driver)
  parse off the first whitespace-separated entry in the user’s analysis_driver, and convert it to an absolute path if it begins with ./ or .., replacing the passed string if needed. Returns true if the first token was modified.
- static void split_wildcard (const std::string &path_with_wc, bfs::path &search_dir, bfs::path &wild_card)
  given a string with an optional path and a wildcard, e.g., /tmp/D*.?pp, parse it into the search path /tmp (default .) and the wildcard D*.?pp. Return wild_card as path to reduce wstring conversions
- static bfs::path concat_path (const bfs::path &p_in, const String &tag)
  concatenate a string onto the end of a path
- static bfs::path system_tmp_file (const std::string &prefix)
  generate a valid temporary file name <prefix>_%%%
- static bfs::path system_tmp_path ()
  get the system tmp path, e.g., /tmp or C:
- static bool create_directory (const bfs::path &dir_path, short mkdir_option)
  Create a directory, with options for remove or error.
- static void recursive_remove (const bfs::path &rm_path, short fileop_option)
  Remove a path (file, directory, or symlink) without regard to its type. Only error if existed and there’s an error in the remove.
- static void rename (const bfs::path &old_path, const bfs::path &new_path, short fileop_option)
  Rename a file, catching any errors and optionally warning/erroring.
- static void link_items (const StringArray &source_items, const bfs::path &dest_dir, bool overwrite)
top-level link a list of source paths (files, directories, symlinks), potentially including wildcards, from destination dir, which must exist

- static void copy_items (const StringArray &source_items, const bfs::path &dest_dir, bool overwrite)
  copy a list of source paths (files, directories, symlinks), potentially including wildcards into destination dir, which must exist

- static void prepend_path_items (const StringArray &source_items)
  prepend any directories (including wildcards) found in source items to the preferred environment path; this will update cached preferred path and PATH

- static bool check_equivalent_dest (const StringArray &source_items, const bfs::path &dest_dir)
  check whether any of the passed source items are filesystem equivalent to the destination path, return true if any one is equivalent to dest

- static bool find_driver (const StringArray &source_items, const bfs::path &search_driver)
  check whether the any of the passed source items (possibly including wildcards to be expanded) matches the passed search driver

- static bool link (const bfs::path &src_path, const bfs::path &dest_dir, bool overwrite)
  create link from dest_dir/src_path.filename() to a single path (file, dir, link) in source directory

- static bool recursive_copy (const bfs::path &src_path, const bfs::path &dest_dir, bool overwrite)
  Recursive copy of src_path into dest_dir, with optional top-level overwrite (remove/recreate) of dest_dir/src_path.filename()

- static bool prepend_path_item (const bfs::path &src_path, const bfs::path &dest_dir, bool overwrite)
  prepend the preferred env path with source path if it’s a directory; this will update cached preferred path and manipulate PATH

- static bool check_equivalent (const bfs::path &src_path, const bfs::path &dest_dir, bool overwrite)
  return true if the src and dest are filesystem equivalent

- static bool find_file (const bfs::path &src_path, const bfs::path &search_file, bool overwrite)
  return true if the src_path is a regular file and has same filename as search_file

- static bool file_op_items (const file_op_function &file_op, const StringArray &source_paths, const bfs::path &dest_dir, bool overwrite)
  recursively perform file_op (copy, path adjust, etc.) on a list of source_paths (files, directories, symlinks), which potentially include wildcards, w.r.t. destination_dir

- static void set_preferred_path ()
  set/reset PATH to dakPreferredEnvPath

- static void set_preferred_path (const boost::filesystem::path &extra_path)
  set PATH to absolute(extra_path):dakPreferredEnvPath, without changing cached preferred PATH

- static void reset ()
  Resets the working directory "state" to its initial state when DAKOTA was launched.

### Private Member Functions

- WorkdirHelper ()
  default constructor

- WorkdirHelper (const WorkdirHelper &)
  copy constructor

- ~WorkdirHelper ()
  destructor

- WorkdirHelper & operator= (const WorkdirHelper &)
  assignment operator
Static Private Member Functions

- static bfs::path po_which (const std::string &driver_name)
  Returns the bfs::path for the analysis driver - POSIX-style implementation, returns empty if not found.
- static std::string init_startup_path ()
  Initializes class member, startupPATH.
- static std::string init_preferred_env_path ()
  Initializes class member, dakPreferredEnvPath.
- static std::vector<std::string> tokenize_env_path (const std::string &path)
  Tokenizes $PATH environment variable into a "list" of directories.

Static Private Attributes

- static std::string startupPWD = "."
  Value of $PWD var upon entry to dakota main()
- static std::string startupPATH = "."
  Value of $PATH (PATH% on windows) var upon entry to dakota main(), omitting any leading PATH= or Path=.
- static std::string dakPreferredEnvPath = "."
  Dakota preferred search PATH/Path = ".:startupPWD:startupPATH", omitting any leading PATH= or Path=.

13.250.1 Detailed Description

Utility class for cross-platform management of environment and paths. Including directory and file operations. On initialization, this class does not manipulate the present working directory, nor the PATH environment variable, but stores context to manipulate them later.

13.250.2 Member Function Documentation

void initialize ( ) [static]
initialize (at runtime) cached values for paths and environment
  Initialize defers calls to Boost filesystem utilities until runtime (required on some operating systems.
  References WorkdirHelper::dakPreferredEnvPath, WorkdirHelper::init_preferred_env_path(), WorkdirHelper-::init_startup_path(), WorkdirHelper::startupPATH, and WorkdirHelper::startupPWD.
  Referenced by Environment::Environment().

void prepend_preferred_env_path ( const std::string &extra_path ) [static]
Prepend cached preferredEnvPath with extra_path and update $PATH environment variable.
  Overwrites $PATH with an additional directory prepended, typically for the purpose of ensuring templatedir
  is in the $PATH; updates cached preferred PATH and environment PATH, so exercise caution with repeated calls.
  References WorkdirHelper::dakPreferredEnvPath, WorkdirHelper::set_environment(), and WorkdirHelper::startup-PWD.
  Referenced by WorkdirHelper::prepend_path_item().
bfs::path which (const std::string & driver_name) [static]

Returns the bfs::path for the analysis driver, supporting typical windows filename extensions, or empty if not found.

Uses string representing $PATH to locate an analysis driver on the host computer. Returns the path to the driver (as a string).

This version is a wrapper over the "plain ol' which" implementation, allowing an array of windows, 3-letter extensions to be checked.

References Dakota::get_pathext(), and WorkdirHelper::po_which().
Referenced by NIDRProblemDescDB::check_driver().

void split wildcard (const std::string & path with wc, bfs::path & search dir, bfs::path & wildcard) [static]

given a string with an optional path and a wildcard, e.g., /tmp/D*.?pp, parse it into the search path /tmp (default .) and the wildcard D*.?pp. Return wildcard as path to reduce wstring conversions

Input: path with wc; Output: search dir, wildcard
Referenced by WorkdirHelper::file_op_items().

bool create directory (const bfs::path & dir path, short mkdir option) [static]

Create a directory, with options for remove or error.

mkdir_option is DIR_CLEAN (remove and recreate), DIR_PERSIST (leave existing), or DIR_ERROR (don't allow existing) returns whether a new directory was created.

References Dakota::abort_handler(), and WorkdirHelper::recursive_remove().
Referenced by ProcessApplicInterface::define_filenames().

void link items (const StringArray & source items, const bfs::path & dest dir, bool overwrite) [static]

top-level link a list of source paths (files, directories, symlinks), potentially including wildcards, from destination dir, which must exist

Iterate source items (paths or wildcards), linking each of them from the destination. If overwrite, remove and replace any existing destination target, otherwise, allow to persist

References WorkdirHelper::file_op_items(), and WorkdirHelper::link().
Referenced by ProcessApplicInterface::define_filenames().

void copy items (const StringArray & source items, const bfs::path & dest dir, bool overwrite) [static]

copy a list of source paths (files, directories, symlinks), potentially including wildcards into destination dir, which must exist

Iterate source items (paths or wildcards), copying each of them into the destination. If overwrite, remove and replace any existing destination target, otherwise, allow to persist

References WorkdirHelper::file_op_items(), and WorkdirHelper::recursive_copy().
Referenced by ProcessApplicInterface::define_filenames().
bool link ( const bfs::path & src_path, const bfs::path & dest_dir, bool overwrite ) [static]

create link from dest_dir/src_path.filename() to a single path (file, dir, link) in source directory
Assumes source file exists since it was iterated in the calling context. If overwrite, any existing file in dest_dir
will be removed prior to creating the new link.
References Dakota::abort_handler().
Referenced by WorkdirHelper::link_items().

bool recursive_copy ( const bfs::path & src_path, const bfs::path & dest_dir, bool overwrite ) [static]

Recursive copy of src_path into dest_dir, with optional top-level overwrite (remove/recreate) of dest_dir/src_path.filename()

note dest_dir is the containing folder for the src_path contents to be placed in for consistency with other
convenience functions (may need to reconsider)
References Dakota::abort_handler().
Referenced by WorkdirHelper::copy_items().

bool prepend_path_item ( const bfs::path & src_path, const bfs::path & dest_dir, bool overwrite ) [static]

prepend the preferred env path with source path if it's a directory; this will update cached preferred path and
manipulate PATH
prepend the env path with source path if it's a directory or directory symlink
References Dakota::abort_handler(), and WorkdirHelper::prepend_preferred_env_path().
Referenced by WorkdirHelper::prepend_path_items().

bool file_op_items ( const file_op_function & file_op, const StringArray & source_items, const bfs::path & dest_dir, bool overwrite ) [static]

recursively perform file_op (copy, path adjust, etc.) on a list of source_paths (files, directories, symlinks), which
potentially include wildcards, w.r.t. destination_dir

Iterator implementation for copy, link, etc file operation. Iterate source items (paths or wildcards), performing
file_op on each w.r.t. destination. If overwrite, remove and replace any existing destination target (at top-level),
otherwise, allow to persist. Return code true indicates abnormal behavior.
References WorkdirHelper::splitWildcard(), and Dakota::strcontains().
Referenced by WorkdirHelper::check_equivalent_dest(), WorkdirHelper::copy_items(), WorkdirHelper::find DRIVER(), WorkdirHelper::link_items(), and WorkdirHelper::prepend_path_items().

void set_preferred_path ( const boost::filesystem::path & extra_path ) [static]

set PATH to absolute(extra_path):dakPreferredEnvPath, without changing cached preferred PATH
If needed, convert the passed item to an absolute path (while could make sense to prepend a relative path, no
current use cases) and prepend when setting environment. Does not update cached preferred path.
References WorkdirHelper::dakPreferredEnvPath, WorkdirHelper::rel_to_abs(), and WorkdirHelper::set_environment().

bfs::path po_which ( const std::string & driver_name ) [static], [private]

Returns the bfs::path for the analysis driver - POSIX-style implementation, returns empty if not found.
For absolute driver_name, validates that is regular file. For relative, uses string representing $PATH (preferred
path) to locate an analysis driver on the host computer. Returns the path to the driver, or empty if not found.
This is the "plain ol’ which" impl that worked well, historically, on POSIX.
References Dakota::contains(), WorkdirHelper::dakPreferredEnvPath, and WorkdirHelper::tokenize_env_path(). Referenced by WorkdirHelper::which().

```
std::string init_start_up_path() [static], [private]
```
Initializes class member, startupPATH.
- Gets the $PATH (PATH% on windows) and returns the std::string value
- References Dakota::abort_handler().
- Referenced by WorkdirHelper::initialize().

```
std::string init_preferred_env_path() [static], [private]
```
Initializes class member, dakPreferredEnvPath.
- Prepends . and the startupPWD to the initial startup $PATH string so that analysis driver detection is more robust
- References WorkdirHelper::startupPATH, and WorkdirHelper::startupPWD.
- Referenced by WorkdirHelper::initialize().

```
std::vector<std::string> tokenize_env_path(const std::string & env_path) [static], [private]
```
Tokenizes $PATH environment variable into a "list" of directories.
- Creates a a vector of directories (as an aid to search) by breaking up the $PATH environment variable (passed in as a string argument)
- Referenced by WorkdirHelper::po_which().
- The documentation for this class was generated from the following files:
  - WorkdirHelper.hpp
  - WorkdirHelper.cpp
Chapter 14

File Documentation

14.1 dakota_dll_api.cpp File Reference

This file contains a DakotaRunner class, which launches DAKOTA.

Namespaces

- Dakota
  
  The primary namespace for DAKOTA.

Constant Groups

- Dakota
  
  The primary namespace for DAKOTA.

Functions

- void DAKOTA_DLL_FN dakota_create (int *dakota_ptr_int, const char *logname)
  
  create and configure a new DakotaRunner, adding it to list of instances

- int DAKOTA_DLL_FN dakota_readInput (int id, const char *dakotaInput)
  
  command DakotaRunner instance id to read from file dakotaInput

- void DAKOTA_DLL_FN dakota_get_variable_info (int id, char ***pVarNames, int *pNumVarNames, char ***pRespNames, int *pNumRespNames)
  
  return the variable and response names

- int DAKOTA_DLL_FN dakota_start (int id)
  
  command DakotaRunner instance id to start (plugin interface and run strategy)

- void DAKOTA_DLL_FN dakota_destroy (int id)
  
  delete Dakota runner instance id and remove from active list

- void DAKOTA_DLL_FN dakota_stop (int *id)
  
  command DakotaRunner instance id to stop execution

- const char *DAKOTA_DLL_FN dakota_getStatus (int id)
  
  return current results output as a string

- int get_mc_ptr_int ()
get the DAKOTA pointer to ModelCenter
- void set_mc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter
- int get_dc_ptr_int ()
  get the DAKOTA pointer to ModelCenter current design point
- void set_dc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter current design point

14.1.1 Detailed Description
This file contains a DakotaRunner class, which launches DAKOTA.

14.1.2 Function Documentation

void DAKOTA_DLL_FN dakota_stop ( int * id )
command DakotaRunner instance id to stop execution
  TODO: trick application to quit through the syscall interface or throw exception.

14.2 dakota_dll_api.h File Reference
API for DLL interactions.

Functions
- void DAKOTA_DLL_FN dakota_create (int *dakota_ptr_int, const char *logname)
  create and configure a new DakotaRunner, adding it to list of instances
- int DAKOTA_DLL_FN dakota_readInput (int id, const char *dakotaInput)
  command DakotaRunner instance id to read from file dakotaInput
- int DAKOTA_DLL_FN dakota_start (int id)
  command DakotaRunner instance id to start (plugin interface and run strategy)
- void DAKOTA_DLL_FN dakota_destroy (int id)
  delete Dakota runner instance id and remove from active list

- void DAKOTA_DLL_FN set_mc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter
- int DAKOTA_DLL_FN get_dc_ptr_int ()
  get the DAKOTA pointer to ModelCenter current design point
- void DAKOTA_DLL_FN set_dc_ptr_int (int ptr_int)
  set the DAKOTA pointer to ModelCenter current design point
14.3. DAKOTA_LINEAR_ALGEBRA.HPP FILE REFERENCE

- void DAKOTA_DLL_FN dakota_get_variable_info (int id, char ***pVarNames, int *pNumVarNames, char ***pRespNames, int *pNumRespNames)
  return the variable and response names

14.2.1 Detailed Description
API for DLL interactions.

14.2.2 Function Documentation
void DAKOTA_DLL_FN dakota_stop ( int *id )
command DakotaRunner instance id to stop execution
  TODO: trick application to quit through the syscall interface or throw exception.

14.3 dakota_linear_algebra.hpp File Reference

Dakota linear algebra utilities.

Namespaces
- Dakota
  The primary namespace for DAKOTA.

Constant Groups
- Dakota
  The primary namespace for DAKOTA.

Functions
- void svd (RealMatrix &matrix, RealVector &singular_vals, RealMatrix &v_trans, bool compute_vectors=true)
  Compute the SVD of an arbitrary matrix A = USVᵀ.
- void singular_values (RealMatrix &matrix, RealVector &singular_values)
  compute the singular values without storing any singular vectors (A will be destroyed)
- int qr (RealMatrix &A)
  Compute an in-place QR factorization A = QR.
- int qr_rsolve (const RealMatrix &q_r, bool transpose, RealMatrix &rhs)
  Perform a multiple right-hand sides Rinv * rhs solve using the R from a qr factorization.
- double det_AtransA (RealMatrix &A)
  Use SVD to compute det(AᵀA), destroying A with the SVD.

14.3.1 Detailed Description
Dakota linear algebra utilities. Convenience functions to perform Teuchos::LAPACK operations on Dakota RealMatrix/RealVector
14.4 dakota_tabular_io.hpp File Reference

Utility functions for reading and writing tabular data files. Emerging utilities for tabular file I/O. For now, just extraction of capability from separate contexts to facilitate rework. These augment (and leverage) those in data_-util.h.

Namespaces

- **Dakota**
  
  *The primary namespace for DAKOTA.*

Constant Groups

- **Dakota**
  
  *The primary namespace for DAKOTA.*

Functions

- **String format_name** (unsigned short tabular_format)
  
  *Translate tabular_format into a user-friendly name.*

- **void print_expected_format** (std::ostream &s, unsigned short tabular_format, size_t num_rows, size_t num_cols)
  
  *Describe the expected data file format based on passed parameters.*

- **void print_unexpected_data** (std::ostream &s, const String &filename, const String &context_message, unsigned short tabular_format)
  
  *Print a warning if there's extra data in the file.*

- **void open_file** (std::ifstream &data_file, const std::string &input_filename, const std::string &context_message)
  
  *Open the file specified by name for reading, using passed input stream, presenting context-specific error on failure.*

- **void open_file** (std::ofstream &data_file, const std::string &output_filename, const std::string &context_message)
  
  *Open the file specified by name for writing, using passed output stream, presenting context-specific error on failure.*

- **void close_file** (std::ifstream &data_file, const std::string &input_filename, const std::string &context_message)
  
  *Close the file specified by name after reading, using passed input stream, presenting context-specific error on failure.*

- **void close_file** (std::ofstream &data_file, const std::string &output_filename, const std::string &context_message)
  
  *Close the file specified by name after writing, using passed output stream, presenting context-specific error on failure.*

- **void write_header_tabular** (std::ostream &tabular_ostream, const Variables &vars, const Response &response, const std::string &counter_label, unsigned short tabular_format)
  
  *Output the header row (labels) for a tabular data file for variables and responses, with variables in input spec order. Conditionally include interface ID. Primary uses: environment tabular data, pre-run output, surrogate approx evals.*

- **void write_header_tabular** (std::ostream &tabular_ostream, const Variables &vars, const StringArray &addtnl_labels, const std::string &counter_label, unsigned short tabular_format)
Output the header row (labels) for a tabular data file for variables and additional labels not tied to a response. Variables are in input spec order. Conditionally include interface ID. Primary uses: MCMC chain export, including calibration sigmas.

- void **write_leading_columns** (std::ostream &tabular_ostream, size_t eval_id, const String &iface_id, unsigned short tabular_format)

  Write the leading column with eval ID and conditionally, the interface ID.

- void **write_data_tabular** (std::ostream &tabular_ostream, const Variables &vars, const String &iface, size_t counter, unsigned short tabular_format)

  Output a row of tabular data from a variables object. All active/inactive variables written in input spec order. Conditionally include interface ID. Primary uses: output of sampling sets.

- void **write_data_tabular** (std::ostream &tabular_ostream, const Variables &vars, const String &iface, const Response &response, size_t counter, unsigned short tabular_format)

  Output a row of tabular data from variables and response objects. All active/inactive variables written in input spec order. Conditionally include interface ID. Primary uses: environment tabular data, pre-run output, surrogate approx evals.

- void **write_data_tabular** (const std::string &output_filename, const std::string &context_message, const RealVectorArray &output_coeffs, const UShort2DArray &output_indices)

  PCE export: write freeform format file with whitespace-separated data where each row has num_fns reals from coeffs, followed by num_vars unsigned shorts from indices.

- bool **exists_extra_data** (std::istream &tabular_file)

  Check if an input stream contains unexpected additional data.

- void **read_header_tabular** (std::istream &input_stream, unsigned short tabular_format)

  read and discard header line from the stream

- void **read_leading_columns** (std::istream &input_stream, unsigned short tabular_format)

  read leading columns [ int eval_id [ String iface_id ] ]

- void **read_leading_columns** (std::istream &input_stream, unsigned short tabular_format, int &eval_id, String &iface_id)

  read leading columns [ int eval_id [ String iface_id ] ]

- void **read_data_tabular** (const std::string &input_filename, const std::string &context_message, RealVector &input_data, size_t num_entries, unsigned short tabular_format)

  read possibly header-annotated whitespace-separated data into a vector of length num_entries; if annotated then it's a column vector for now

- void **read_data_tabular** (const std::string &input_filename, const std::string &context_message, Variables vars, size_t num_fns, RealMatrix &vars_matrix, RealMatrix &resp_matrix, unsigned short tabular_format, bool active_only)

  Tabular read for ApproximationInterface challenge data: read possibly header-annotated whitespace-separated data of possible mixed Variables, followed by num_fns, each into RealMatrix with minimal error checking.

- void **read_data_tabular** (const std::string &input_filename, const std::string &context_message, RealVectorArray &input_coeffs, UShort2DArray &input_indices, unsigned short tabular_format, size_t num_vars, size_t num_fns)

  Tabular read for PCE import: read possibly header-annotated whitespace-separated data of unknown length where each row has num_fns reals followed by num_vars unsigned shorts; append data to arrays passed by reference.

- void **read_data_tabular** (const std::string &input_filename, const std::string &context_message, Variables vars, Response resp, PRPList &input_prp, unsigned short tabular_format, bool verbose=false, bool active_only=false)

  Tabular read for DataFitSurfModel (build points): read whitespace-separated data with optional row and column headers into lists of Variables and Responses until out of data.
14.4.1 Detailed Description

Utility functions for reading and writing tabular data files Emerging utilities for tabular file I/O. For now, just extraction of capability from separate contexts to facilitate rework. These augment (and leverage) those in data- util.h. Design/capability goals: Ability to read / write data with row/col headers or in free-form Detect premature end of file, report if extra data More consistent and reliable checks for file open errors Require right number of cols in header mode; only total data checking in free-form (likely) Allow comment character for header rows or even in data? variables vs. variables/responses for both read and write Should we support CSV? delimiter = ‘,’; other? Verify treatment of trailing newline without reading a zero Allow reading into the transpose of the data structure

14.5 dll_tester.cpp File Reference

Test the DLL with a DAKOTA input file.

Functions

- int main (int argc, char ∗argv[ ])

  The main program for exercising the DLL API with a simple command-line.

14.5.1 Detailed Description

Test the DLL with a DAKOTA input file.

14.6 JEGAOptimizer.cpp File Reference

Contains the implementation of the JEGAOptimizer class.

Classes

- class JEGAOptimizer::Evaluator

  An evaluator specialization that knows how to interact with Dakota.
14.7. JEGAOPTIMIZER.HPP FILE REFERENCE

- class JEGAOptimizer::EvaluatorCreator
  A specialization of the JEGA::FrontEnd::EvaluatorCreator that creates a new instance of a Evaluator.

- class JEGAOptimizer::Driver
  A subclass of the JEGA front end driver that exposes the individual protected methods to execute the algorithm.

Namespaces

- Dakota
  The primary namespace for DAKOTA.

Constant Groups

- Dakota
  The primary namespace for DAKOTA.

Functions

- template<typename T>
  string asstring (const T &val)
  Creates a string from the argument val using an ostringstream.

14.6.1 Detailed Description

Contains the implementation of the JEGAOptimizer class.

14.7 JEGAOptimizer.hpp File Reference

Contains the definition of the JEGAOptimizer class.

Classes

- class JEGAOptimizer
  A version of Dakota::Optimizer for instantiation of John Eddy’s Genetic Algorithms (JEGA).

- class JEGATraits
  A version of TraitsBase specialized for John Eddy’s Genetic Algorithms (JEGA).

Namespaces

- Dakota
  The primary namespace for DAKOTA.

Constant Groups

- Dakota
  The primary namespace for DAKOTA.
14.7.1 Detailed Description

Contains the definition of the JEGAOptimizer class.

14.8 library_mode.cpp File Reference

file containing a mock simulator main for testing Dakota in library mode

Classes

- struct callback_data

Functions

- void fpinit_AS() 
- void run_dakota_parse (const char *dakota_input_file) 
  
  Run a Dakota LibraryEnvironment, mode 1: parsing an input file.
- void run_dakota_data () 
  
  Run a Dakota LibraryEnvironment, mode 2: from C++ API inserted data.
- void run_dakota_mixed (const char *dakota_input_file, bool mpirun_flag) 
  
  Run a Dakota LibraryEnvironment, from string or input file input, supplemented with additional C++ API adjustments.
- void serial_interface_plugin (Dakota::LibraryEnvironment &env) 
  
  Convenience function with simplest example of interface plugin: plugin a serial DirectApplicInterface that can be constructed independent of Dakota’s configuration details.
- void parallel_interface_plugin (Dakota::LibraryEnvironment &env) 
  
  Convenience function to plug a library client’s interface into the appropriate model, demonstrating use of Dakota parallel configuration in constructing the plugin Interface on the right MPI Comm.
- static void callback_function (Dakota::ProblemDescDB *db, void *ptr) 
  
  Example: user-provided post-parse callback (Dakota::DbCallbackFunction)
- int main (int argc, char *argv[]) 
  
  A mock simulator main for testing Dakota in library mode.

Variables

- static const char serial_input [ ] 
  
  Default Dakota input string for serial case (rosenbrock):
- static const char parallel_input [ ] 
  
  Default Dakota input string for parallel case (text_book)

14.8.1 Detailed Description

file containing a mock simulator main for testing Dakota in library mode
14.8. LIBRARY_MODE.CPP FILE REFERENCE

14.8.2 Function Documentation

void fpinit_ASL ( )

Floating-point initialization from AMPL: switch to 53-bit rounding if appropriate, to eliminate some cross-
platform differences.

Referenced by main().

void run_dakota_parse ( const char * dakota_input_file )

Run a Dakota LibraryEnvironment, mode 1: parsing an input file.

Simplest library case: this function parses from an input file to define the ProblemDescDB data.

References Environment::execute(), ProgramOptions::input_file(), Environment::mpi_manager(), MPIManager-
::mpirun_flag(), parallel_interface_plugin(), serial_interface_plugin(), and MPIManager::world_rank().

Referenced by main().

void run_dakota_data ( )

Run a Dakota LibraryEnvironment, mode 2: from C++ API inserted data.

Rather than parsing from an input file, this function populates Data class objects directly using a minimal
specification and relies on constructor defaults and post-processing in post_process() to fill in the rest.

References DataInterface::data_rep(), DataResponses::data_rep(), DataVariables::data_rep(), DataMethod::data-
_rep(), LibraryEnvironment::done_modifying_db(), Environment::execute(), Environment::exit_mode(), DataResponses-
Rep::gradientType, DataResponsesRep::hessianType, LibraryEnvironment::insert_nodes(), DataMethodRep::method-
Name, Environment::mpi_manager(), MPIManager::mpirun_flag(), ParallelLibrary::mpirun_flag(), DataVariables-
Rep::numContinuousDesVars, DataResponsesRep::numNonlinearIneqConstraints, DataResponsesRep::numObjective-
Functions, parallel_interface_plugin(), Environment::parallel_library(), serial_interface_plugin(), and ParallelLibrary-
::world_rank().

Referenced by main().

void run_dakota_mixed ( const char * dakota_input_file, bool mpirun_flag )

Run a Dakota LibraryEnvironment, from string or input file input, supplemented with additional C++ API adjust-
ments.

Function to encapsulate the Dakota object instantiations for mode 3: mixed parsing and direct updating.

This function showcases multiple features. For parsing, either an input file (dakota_input_file != NULL) or a
default input string (dakota_input_file == NULL) are shown. This parsed input is then mixed with input from three
sources: (1) input from a user-supplied callback function, (2) updates to the DB prior to Environment instantiation,
(3) updates directly to Iterators/Models following Environment instantiation.

References callback_function(), LibraryEnvironment::done_modifying_db(), ProgramOptions::echo_input(), Environment-
::execute(), LibraryEnvironment::filtered_model_list(), ProblemDescDB::get_sa(), ProgramOptions::input_file(),
ProgramOptions::input_string(), Environment::mpi_manager(), MPIManager::mpirun_flag(), parallel_input, parallel-
_interface_plugin(), Environment::parallel_library(), Environment::problem_description_db(), ProblemDescDB::resolve-
top_method(), callback_data::rosen_cdv_upper_bd, serial_input, serial_interface_plugin(), ProblemDescDB::set(),
and ParallelLibrary::world_rank().

Referenced by main().

void serial_interface_plugin ( Dakota::LibraryEnvironment & env )

Convenience function with simplest example of interface plugin: plugin a serial DirectApplicInterface that can be
constructed independent of Dakota’s configuration details.
Demonstration of simple plugin where client code doesn’t require access to detailed Dakota data (such as Model-based parallel configuration information) to construct the DirectApplicInterface. This example plugs-in a derived serial direct application interface instance (“plugin_rosenbrock”). References Dakota::abort_handler(), LibraryEnvironment::plugin_interface(), and Environment::problem_description_db(). Referenced by run_dakota_data(), run_dakota_mixed(), and run_dakota_parse().

```cpp
void parallel_interface_plugin ( Dakota::LibraryEnvironment & env )
```

Convenience function to plug a library client’s interface into the appropriate model, demonstrating use of Dakota parallel configuration in constructing the plugin Interface on the right MPI Comm.

From a filtered list of Model candidates, plug-in a derived direct application interface instance (“plugin_textbook” for parallel). This approach provides more complete access to the Model, e.g., for access to analysis communicators.

References Dakota::abort_handler(), Interface::assign_rep(), LibraryEnvironment::filtered_model_list(), ProblemDescDB::get_db_model_node(), Environment::problem_description_db(), and ProblemDescDB::set_db_model_nodes(). Referenced by run_dakota_data(), run_dakota_mixed(), and run_dakota_parse().

```cpp
static void callback_function ( Dakota::ProblemDescDB * db, void * ptr ) [static]
```

Example: user-provided post-parse callback (Dakota::DbCallbackFunction)

Example of user-provided callback function (an instance of Dakota::DbCallbackFunction) to override input provided by parsed Dakota input file or input string data.

References Dakota::contains(), ProblemDescDB::get_sa(), ProblemDescDB::get_ushort(), ProblemDescDB::resolve_top_method(), callback_data::rosen_cdy_upper_bd, and ProblemDescDB::set(). Referenced by run_dakota_mixed().

```cpp
int main ( int argc, char * argv[ ] )
```

A mock simulator main for testing Dakota in library mode.

Overall Usage: dakota_library_mode [-mixed] [dakota.in]

Uses alternative instantiation syntax as described in the library mode documentation within the Developers Manual. Tests several problem specification modes:

1. run_dakota_parse: reads all problem specification data from a Dakota input file. Usage: dakota_library_mode dakota.in
2. run_dakota_data: creates all problem specification from direct Data instance instantiations in the C++ code. Usage: dakota_library_mode
3. run_dakota_mixed: a mixture of input parsing and direct data updates, where the data updates occur: (a) via the DB during Environment instantiation, and (b) via Iterators/Models following Environment instantiation. Usage: dakota_library_mode -mixed (input from default string) dakota_library_mode -mixed dakota.in (input from specified file)

Serial cases use a plugin rosenbrock model, while parallel cases use textbook.

References MPIManager::detect_parallel_launch(), fpinit_AS(), Dakota::mpi_debug_hold(), run_dakota_data(), run_dakota_mixed(), and run_dakota_parse().

### 14.8.3 Variable Documentation

```cpp
const char serial_input[ ] [static]
```

Initial value:
14.9. LIBRARY_SPLIT.CPP FILE REFERENCE

Default Dakota input string for serial case (rosenbrock):
Referenced by run_dakota_mixed().

const char parallel_input[ ] [static]
Initial value:

Default Dakota input string for parallel case (text_book)
Referenced by run_dakota_mixed().

14.9 library_split.cpp File Reference
file containing a mock simulator main for testing DAKOTA in library mode on a split communicator

Functions

- void manage_mpi (MPI_Comm &my Comm, int &color)
  Split MPI_COMM_WORLD, returning the comm and color.
- void gen_dakota_input (const int &color, std::string &input)
  Return the appropriate DAKOTA input based on color (1 or 2)
- void run_dakota (const MPI_Comm &comm, const std::string &input, const int &color)
  Launch DAKOTA on passed communicator, tagging output/error with color.
- void collect_results ()
  Wait for and collect results from DAKOTA runs.
- int main (int argc, char *argv[])
  Driver routine for testing library mode with partitioned MPI_Comm. This test fixture requires MPI and can be run on 3–8 processors.
14.9.1 **Detailed Description**

file containing a mock simulator main for testing DAKOTA in library mode on a split communicator

### 14.10 main.cpp File Reference

file containing the main program for DAKOTA

#### Functions

- `void fpinit_ASLS()`
- `int main(int argc, char* argv[])`

*The main DAKOTA program.*

14.10.1 **Detailed Description**

file containing the main program for DAKOTA

14.10.2 **Function Documentation**

`void fpinit_ASLS()`

Floating-point initialization from AMPL: switch to 53-bit rounding if appropriate, to eliminate some cross-platform differences.

`int main(int argc, char* argv[])`

The main DAKOTA program.

Manage command line inputs, input files, restart file(s), output streams, and top level parallel iterator communicators. Instantiate the ExecutableEnvironment and invoke its execute() virtual function.

References Environment::check(), ExecutableEnvironment::execute(), fpinit_ASLS(), Dakota::mpi_debug_hold(), and Dakota::register_signal_handlers().

### 14.11 QUESOImpl.hpp File Reference

#### Classes

- `class QuesoJointPdf< V, M >`
  *Dakota specialization of QUESO generic joint PDF.*

- `class QuesoVectorRV< V, M >`
  *Dakota specialization of QUESO vector-valued random variable.*

- `class DerivInformedPropCovTK< V, M >`
  *Dakota transition kernel that updates proposal covariance based on derivatives (for random walk case)*

- `class DerivInformedPropCovLogitTK< V, M >`
  *Dakota transition kernel that updates proposal covariance based on derivatives (for logit random walk case)*

- `class TKFactoryDIPC`
  *Custom RW TKfactory: passes Dakota QUESO instance pointer to the TK at build.*

- `class TKFactoryDIPCLogit`
  *Custom Logit RW TKfactory: passed Dakota QUESO instance pointer to the TK at build.*
14.12. RESTART_UTIL.CPP FILE REFERENCE

Namespaces

  The primary namespace for DAKOTA.

14.11.1 Detailed Description

QUESO specializations for evaluations and utilities

14.12 restart_util.cpp File Reference

file containing the DAKOTA restart utility main program

Namespaces

- Dakota
  
  The primary namespace for DAKOTA.

Constant Groups

- Dakota
  
  The primary namespace for DAKOTA.

Functions

- void print_usage (std::ostream &s)
  
  print restart utility help message
- void print_restart (StringArray pos_args, String print_dest)
  
  print a restart file
- void print_restart_pdb (StringArray pos_args, String print_dest)
  
  print a restart file (PDB format)
- void print_restart_tabular (StringArray pos_args, String print_dest, unsigned short tabular_format, int tabular_precision)
  
  print a restart file (tabular format)
- void read_neutral (StringArray pos_args)
  
  read a restart file (neutral file format)
- void repair_restart (StringArray pos_args, String identifier_type)
  
  repair a restart file by removing corrupted evaluations
- void concatenate_restart (StringArray pos_args)
  
  concatenate multiple restart files
- int main (int argc, char *argv[])
  
  The main program for the DAKOTA restart utility.
14.12.1 Detailed Description

file containing the DAKOTA restart utility main program

14.12.2 Function Documentation

```c
int main ( int argc, char * argv[ ] )
```

The main program for the DAKOTA restart utility.

Parse command line inputs and invoke the appropriate utility function (`print_restart()`, `print_restart_tabular()`, `read_neutral()`, `repair_restart()`, or `concatenate_restart()`).

References Dakota::concatenate_restart(), Dakota::print_restart(), Dakota::print_restart_pdb(), Dakota::print_restart_tabular(), Dakota::print_usage(), Dakota::read_neutral(), Dakota::repair_restart(), and Dakota::write_precision.
